A contrast is, therefore, suggested with the fellow-Irishman and fellow-artist, William Butler Yeats. In *Ave* Moore has described Yeats as a type of the eternal Dandy in letters—and there is, indeed, more than a touch of the precious in the man—a tendency which finds partial expression in a certain attenuation in literary style. Yet perhaps preciosity and attenuation alike spring in part from a certain moral fastidiousness, which distinguishes him completely not only from an artist like Moore, but from most artists of our time. Allied to this are equally noble qualities of loyalty, sincerity and devotion, as well as of a singular elation which is at the heart of his philosophy of life, as it is exprest in so many of the brief essays contained in his latest book, with its "precious" title, *The Cutting of an Agate*.[2] It may occur to many of the readers of this book, which, like Moore's, gives a picture of his connection with the Irish movement, tho by indirection only, that Mr. Yeats has, in recent years, sacrificed himself somewhat, as an artist, for the good of a cause. This point is raised also in Mr. Weygandt's book about the *Irish Literary Movement*—noticed in this week's issue. But nothing is farther from Mr. Yeats's own mind than any sentiment of self-sacrifice, and his entire single-heartedness makes Moore's self-conscious insistence upon all that he gave up to go to Ireland seem the meaner and pettier—*le plus mesquin*, the French would say—by comparison. In return, however, for what is simple and genuine in him (in spite of all his intellectual subtlety and complication), Mr. Yeats retains the power to derive spiritual sustenance from the flintiest pastures. The essays in the present volume are entirely occasional and journalistic. Yet how much they contain that is noble and permanent! "There are few writers today," says Remy de Gourmont, à propos of Maurice Barrès, "there have never been many who can, without being laughed at for their presumption, collect their chance articles in book form." Mr. Yeats is one of these fortunate few. The reason is because no interest in the affairs of the moment can make him lose sight of eternal principles, both of life and of art, and because no amount of friendly preoccupation with the personality of an artist can blind him to the superior claims of the world of imaginative ideas as the first concern of the critic. He is almost the only critic of our own day who makes a serious and exhaustive study of the necessary relations between such ideas, or symbols, and the needs of sentiment and emotion which they express. He is not only a real poet, but a real thinker on the nature of poetry, and as such he cannot write on any individual or any manifestation, however remote, without saying something that opens wide gates of revery, or drives deep wells of insight and comprehension, for the contemplative reader.

'Twixt Land and Sea

With the name of Joseph Conrad one almost invariably associates the sea tale which is above all deliberate in matter and manner. His recent works have almost all been lengthy. One is somewhat surprised, therefore, to find his latest volume, *'*'Twixt*

[2] *The Cutting of an Agate*. By William Butler Yeats. New York: The Macmillan Co. $1.50.

''Twixt Land and Sea*. By Joseph Conrad. New York: Geo. H. Doran Co. $1.25.

Land and Sea, made up of three comparatively short stories.

The first of these is built about the well-established theme of the sea captain enthralled against his will by the girl on shore, in this case a girl in every way his inferior. There is novelty in that her sullen unresponsiveness is what allures him, the first sign of reciprocal emotion on her part extinguishing his infatuation. What lingers in the memory is not the thread of story, but the character of Jacobus the ship-chandler—deliberate, pertinacious, stolid. The story as a whole is a vivid study of the tropics, that caldron in which strange passions gather silently and burst into sudden ebullition.

The second tale is also of a captain. New to his ship and the officers under him, he is alone on deck one night, when out of the dark water emerges a swimmer from a vessel two miles away. This apparition confesses that he has been technically guilty of murder, tho not in any moral sense, whereupon the captain smuggles him into his own cabin and conceals him there for several days until the ship is within a swimmer's reach of shore. Mr. Conrad has created a situation of tension thru character rather than incident. There are, to be sure, details of discovery barely averted, but in the main the stress is upon the captain's moods, fears and loyalty to his strange cabin-mate.

The keynote verse on the title page of this volume declares that "life is a tragic folly." Here, as in almost all Conrad, the emphasis is on the tragic. But all who have enjoyed his other tales of hot blood and tropic seas will enjoy this book, done with the author's measured artistic touch.

Greek and Latin Reprints

We have previously called attention to *The Loeb Classical Library* of classical authors, for whose publication the English-speaking world is indebted to a member of a New York banking house. This collection is to include all Greek and Latin authors down to the fall of Constantinople, and the original text, after the best collation of manuscripts, is placed opposite to an English translation by a competent scholar. The latest volumes to reach our desk are Catullus, Tibullus, Euripides (four volumes), Lucian and Appian's *Roman History* (Macmillan, $1.50 per volume). We can hardly conceive a more valuable gift to the scholarly world, and the entire set of some hundreds of 16mo volumes ought, as they appear, to be in every fine private and public library. Think of the pleasure of reading Euripides in English, with the Greek text to refer to on the opposite page! The reader must not look for notes, but must read as he would read a modern work —for pleasure and information; and he would be instructed by the wealth of good and old literature which often seems to have a very modern flavor. We congratulate those who look forward to own the whole of these neat and portable volumes, and those, too, who can afford only to make a selection of their favorite authors.

Pan in Ireland

Some months ago we told the truth about James Stephens's *Mary, Mary;* a most pleasant duty. We now receive from the Messrs. Macmillan a copy of another work of fiction by the same author, *The Crock of Gold* ($1.25.) This is a less comprehensible tale of Irish fairies and gods—to whom is added Pan. Some will be utterly baffled—some may read an elaborate symbolism into all this; but we accept it all as a rather delightful bit of toying with ideas and sentiments, sense and nonsense. Yes, the Philosophers of the tale, the Gray Woman, the Thin Woman, and all. The principal philosopher rambles on in his monologs for all the world like an Anatole France of Merrion Square; an Anatole France with a smaller burden of erudition to shoulder, and rather less maturity, it may be, but at least a younger and not depressing Anatole. Certainly there is a suggestion of a passage in *Penguin Island* in the Philosopher's moralizing upon clothes; a hint of a situation in *Thaïs* in the encounter of the Philosopher and Caivilin. Here is an observation of the Philosopher anent Pan's system: "Our eyes tell us what to think about, and our wisdom is no more than a catalog of sensual stimuli." Doesn't this sum up a school of literary sensationalism, that masquerades variously as "naturalistic" and as "impressionistic" art? But Mr. Stephens's book is best enjoyed as a bit of sophisticated faëry, characteristically whimsical. Next time, however, we shall hope to find something simpler and perhaps even more coherent.

Wild Life Brought Home

A. Radclyffe Dugmore, who is widely known for his skilful and often artistic portrayal, by photography, of animals, especially birds, in their native haunts, has, in *Wild Life and the Camera,* brought together a collection of essays and photographs illustrating outdoor scenes and wild creatures in all parts of the country, from Newfoundland to California (Lippincott, $2). A large part of the contents relates to sport with rifle or rod, in which the author's rôle seems to have been spectator and recorder rather than sportsman. Several of the essays deal with animal life, and are accompanied by striking pictures, as of migrating caribou, ducks in flight, and small birds with their young. The writing is smooth and informatory, but lacks literary distinction.

Literary Notes

One of the funniest books of the year is Irvin Cobb's *Anatomy,* illustrated by Peter Newell at his best (Doran, 75 cents). Like most humorous books, it should be read aloud, and in small doses, to get the most enjoyment out of this unusual anatomical treatise, but the listener will want to peep over the reader's shoulder, to see the pictures.

For those who cannot read Molière in the original, there is Prof. Curtis Hidden Page's rendering in English blank verse. The publishers, G. P. Putnam's Sons, have brought out this competent translation in a single volume; now they are issuing it in neat little books, one for each play. More than half-a-dozen volumes have been publisht in this form; the latest are *The Miser* and *The Misanthrope.*

The Cobweb Cloak is like a delicate old lace fan, such as one finds in a grandmother's wedding chest, faintly fragrant with memories. Upon the ivory traceries of this particular fan still are marks, however, of the secret tears of a sinning woman. This woman's child is happier, and shares her days in turn with the mother, an Irish nurse, fairies and saints. Helen Mackay has written a book of quaint fancies, poetic imaginings, the dreams of a sensitive child, and the heartburnings of a woman (Duffield, $1.25).

Mrs. Dorothy Canfield Fisher has made a careful study of the methods of Maria Montessori, from the standpoint of an educated American mother (*A Montessori Mother.* Holt, $1.25). She finds, as might be expected, that it requires modification in adapting it to our children and introducing it into our primary schools. Yet the author is an enthusiastic partisan of the lovely children's world in which "there is no need for haste," and her book is an interesting one to all mothers and teachers worthy the trust that has been given them. The basis of the Montessori teaching is self-education, and the contrast between the modern kindergarten, with the teacher the center and always directing the work and play of the children, and the Casa dei Bambini, or "Children's Home," with the teacher keeping conscientiously in the background, letting the child direct his own activities, is radical. Mrs. Fisher's book is the best we have seen on the subject.

Simple ceremonies marked the beginning of the construction of the Widener Memorial Library at Harvard University, last month. The new structure is the gift of Mrs. George D. Widener, of Philadelphia, and will cost $2,000,000. A Philadelphian, Mr. Horace Trumbauer, is architect. The new library is a memorial to the late Harry Elkins Widener, who was graduated from Harvard in the class of 1907, and went down with the Titanic. Mr. Widener was an ardent and intelligent collector, and his treasures are to be concentrated in a special fireproof section of the new edifice. While the work of construction continues, Gore Hall, the outgrown library building, is being demolisht; and the books are distributed between the various special collections, old Massachusetts Hall, etc.

Alfred Noyes, whose poem, *The Origin of Life,* was publisht (with a portrait and brief sketch of the author), in THE INDEPENDENT for December 12, 1912, is a visitor in New York, having come to this country to lecture on modern poetry and on militarism. The young English poet is a hearty friend of international arbitration. The New York press is always amusing in its comments upon the distinguisht men of letters who come within range of the city editor's desk; this time it makes much of the fact that Mr. Noyes has made a good living from his versifying ever since he was graduated from Oxford, eleven years ago. To make money out of poetry may set some doubting Thomases to questioning the higher value of the poet's work; but we do not grudge the English traveler his ducats. He has had to work for them as hard as most men of affairs or civil engineers. Nor has he indulged in the exhibitionism or eccentricity of some modern painters.

SURVEY of the WORLD

The Size of Future Liners

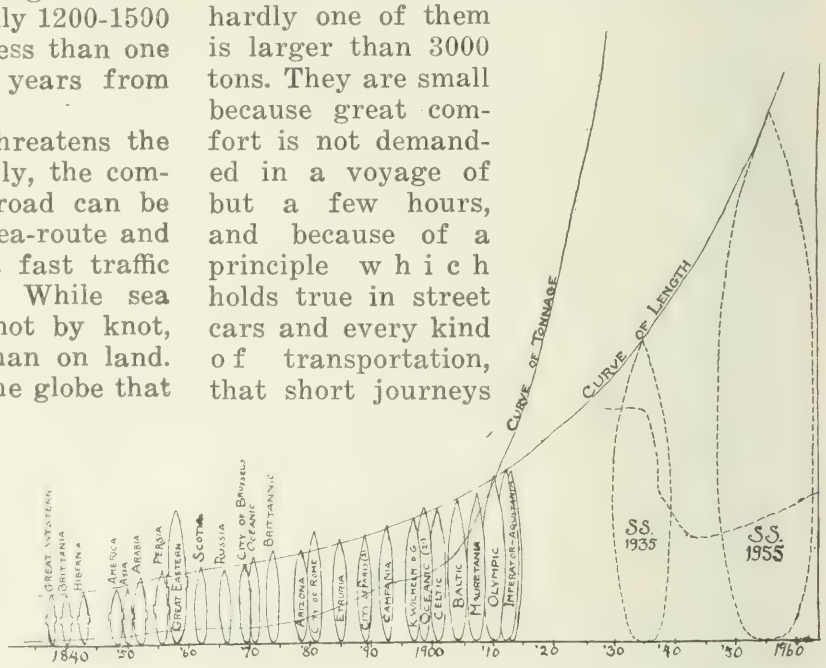
How large are liners going to become? Much greater than the thousand-footer which we hear the White Star Line has ordered? New York has realized within the last year that the question of their future length is one which must be settled. By referring to the diagram the reader will see that the length of steamships has been growing in accordance with a definite curve, which, if projected in the most conservative path to the year 1935 gives us a ship 1600 feet long, and in two more decades one of 2350 feet, or about half a mile. More important than length is tonnage, and this, as is shown by the second curve, is increasing enormously. SS. 1935 would be of some 220,000 gross tons, five times the *Olympic*, and provide as good accommodations for 19,000 passengers. SS. 1955 would register 700,000 tons, a whole merchant marine of to-day, be 240 feet wide and carry 60,000 passengers, besides a crew of some 13,000.

From the way things are going these are conservative inferences, as the diagram shows. Ships have been growing larger ever since Mr. Paleolithicus, or more probably his young son, first sat on a log and paddled himself across a creek. And the growth has been perfectly continuous except for one break at the close of the Roman Empire, when civilization declined. The extremely rapid development of material civilization today will surely not be much halted in the next generation, especially since the speed of progress is accelerating. And of the characteristics of civilization has for a century been a universal growth in the size of things—buildings, railroads, ships, machines—everything is swelling as if Well's "food of the gods" had been sown over the earth.

It is hard to imagine a ship whose cable-links each weigh two-thirds of a ton being launched in two decades and a half. But the curve of growth has been steady and sure, except where the Great Eastern exceeded it, as the diagram shows. If we say that it will not continue in the future we but echo what has been said time and again in the past, and always the curve has continued. Objections that greater ships would be unwieldy, too deep for our harbors, etc., have been made in the past, and blotted out by the next leviathan. If we call impossible these dotted-line ships we may be like the farmer at the circus who on seeing a giraffe, shut his eyes, clenched his hands and said desperately, "Oh h—, there *ain't* no such animal!" For the behomoths of the nearer future are apparently just as surely decreed as the *Aquitania*, whose keel has been laid.

So far as limitations in ship-building and navigation go, there is no reason why ships should not be half a mile long. And there is every reason why they should be. For one, in liners as in other small towns, the larger the community, the greater variety of amusements and comforts may be provided. More important reasons are that the larger the ship the higher speed she can make and the more certain she is of making in thru all weathers. The question of safety is very obscure and very much debated. But two things are certain—that the difference in safety between large and small ships is not great, and that safety will soon be absolute to the passengers of both. All the perils of the deep have already been reduced to three —collision with an iceberg, derelict or another ship. And by thermostats, by fog-dispelling, echo-hearing thru air or water, wireless telephony and many other devices we are rapidly bringing about that every obstruction will at a distance reveal itself as clearly and certainly as if it stood in broad daylight.

The problem of finding enough passengers, 60,000 for one trip does not seem difficult when we consider by what leaps and bounds transoceanic travel is increasing, and that the pooling of steamship business, which right or wrong is on the increase, will more and more focus the thousands of travelers, directing them all now to one ship and now to another.



But, nevertheless, real objections do exist to such monsters as we have indicated. The difficulty of insufficient depth of harbors has not been met in the past, for all the millions of cubic yards we have taken out, because the cost of dredging increases greatly with the depth. Ships have had to grow shallower in proportion to their depth. The *Umbria*, built away back in '73 drew 27 feet, which would shut her from almost all the world's harbors today. The *Mauretania* draws 37 per cent. more and is 57 per cent. longer. With length and beam outgrowing depth, our liners are approaching the model of

river-steamers, at the cost both of speed and of natural strength. As the shallow Suez Canal has kept small the ships of the Orient, so our harbors may limit those of the future.

Moreover, the lengthwise dimension of ships is becoming so great that it will soon be a question, not of dredging a bar, but of finding new harbors. In our own Hudson River, which is wider than most, we are finding immense difficulty in providing, without choking the fairway, a pier long enough for the *Imperator*, which is due in May. As for Liverpool, Hamburg and the rest whose clear channels are only 1200-1500 feet wide, they would become less than one ship length wide but a few years from now.

Another obstruction which threatens the growth of ships is, paradoxically, the competition of trains. For a railroad can be built parallel to almost every sea-route and give quicker service, and it is fast traffic which creates the big ships. While sea speeds are increasing, it is knot by knot, with much greater difficulty than on land. We find, accordingly, all over the globe that the fast steamer is being replaced by the now three times faster as well as more frequent express train. We go to California by rail, tho the Argonauts went by sea. The Londoner goes to Japan by the Trans-Siberian Railway; for India or Australia he goes by train in two days as far as Brindisi. He will soon have a Trans-Persoan Railway to take him to India itself, and some day, perhaps, a continuation of it thru the Malay Peninsula, Sumatra and Java to a point not far from Australia. He is building the Cape-to-Cairo railway to take him to South Africa; in the New World we are planning the Pan-American Railroad, and the very practical Harriman thought of laying the rails across Alaska to Behring Strait, thence to run southwestward to the Trans-siberian. One of the most useful projects, and one which may be realized within 10 years, is a railroad across the desert of Sahara to Cape Verde, whence it is only 1715 marine miles to Pernambuco, Brazil. Roads southward and westward from there already partially built, will reduce the sea-voyage between London and Valparaiso from 8793 knots to 1715. All this withdrawal of ships means a check in the flow of inventions and the improvement of harbors, both necessary to any increase in the size of vessels.

The sea route between New York and Europe can also be made shorter, with important consequences. As mails are already put off at Queenstown, Fishguard, Plymouth and Cherbourg, to save a few hours, while on the American side Montauk Point and Halifax have been suggested, so, if the liners ran from St. Johns, Newfoundland, to Galway the voyage would be reduced from 3270 knots (New York to London) to 1685. A thirty-five knot flier could tear over this stretch of water in 48 hours, a state of affairs which would tend to make liners small, like cross-channel steamers. The boats which ply the English Channel and North Sea handle an enormous fast traffic, yet hardly one of them is larger than 3000 tons. They are small because great comfort is not demanded in a voyage of but a few hours, and because of a principle which holds true in street cars and every kind of transportation, that short journeys call for immediate service—a ferry or a cross-channel steamer for each train—rather than for speed when once started. Furthermore, these ocean ferryboats would be deprived of all their freight traffic, by the lengthening of the rail route, so that another motive for size, the carrying of freight cheaply, would be done away with. Designed to ferry across by the short route only a few tons of mail and cabin passengers, or by the long route to carry freight and steerage passengers cheaply, i. e., slowly, the future liners would not be large.

And the "whale-path" will not have its ships always, even in this one Atlantic stretch where no land is. For overhead is the path of the air, and the aeroplane, still in its infancy, has flown 120 miles an hour, four feet to one of the "greyhound" *Mauretania*. In a few years we may expect large and safe aeroplanes to make 200-300-400 miles an hour—here is speed such as cannot be reached on sea or land. And when mail and passengers leave the ships, there are only small freighters left. The liners are facing their end—already the birds of ill omen are to be discerned in the sky.

A dotted line in the diagram, starting at the bow of the *Aquitania*, indicates, according to the author's opinion, the evolution in length of future liners.

S. C. GILFILLAN.

Patriotism and Plays

In France, at any rate, the theater is prompt to reflect any change in popular sentiment. This is true of the serious drama no less than of the *revues* and lighter entertainments, which the American tourist may attend out of interest in their dancing and facetiousness, but whose real point he is likely to miss, simply because the slang in which their ribald and satiric songs are written defies the understanding of anyone but the Parisian.

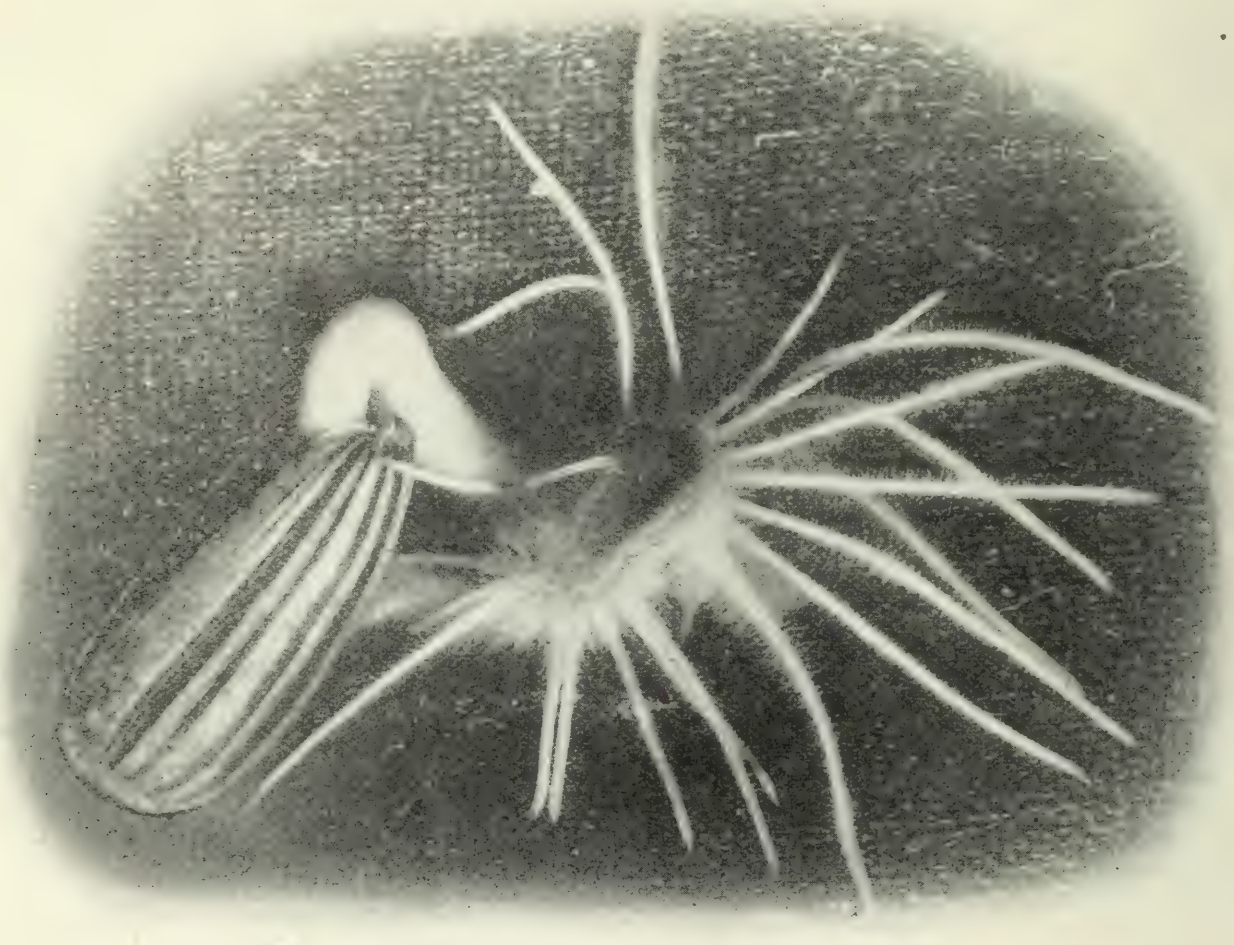
To confine ourselves to the serious drama, however. One need go no further than New York to find an illustration, for in the play by M. Kistermaecker, which went by the name of *la Flambée* in Paris and, in a translation called *The Spy*, holds the stage of a Broadway theater, one straightway recognizes a product of the last few years. The play's period is stampt upon it by the place which the patriotic instinct plays in its denouement. The same motive makes the effectiveness of the latest play of M. Henri Lavedan, interpreted by the greatest living French actor, Lucien Guitry. This last piece is entitled quite simply *Servir*—"To Serve."

It is not, however, in plays alone that the revival of the national spirit in France is demonstrated. René Bazin's novel, *les Oberlé*, translated *The Children of Alsace*, and Maurice Barrès's *Colette Baudoche*, both mark the reopening of the question of the Lost Provinces—Shall they be abandoned permanently? French popular sentiment replies No, altho it is only a few years since all thought of *la Revanche* seemed to have been given up except by fire-eaters pure and simple. A young Frenchman, a cool-headed professor in a New York institution, remarked to us the other day that when Francis Joseph died Austria-Hungary was bound to break up, and Germany would seek to annex Austria. "We might agree to that—and Russia, too," he magnanimously conceded, "provided Alsace-Lorraine was returned to us." The feeling of depression and futility which swept over the generation that was young in 1870 and matured too suddenly during the horrors of war and Commune is forgotten today. And France has taken to herself almost too much comfort from the fact that the Turks used German artillery and had been drilled by German tacticians, while the victorious Bulgars used French arms and had received instruction from St. Cyr.

Meanwhile a play called *Alsace*, written by the detective-novelist, Gaston Leroux, and staged by M. Camille, has been presented to enthusiastic audiences in Paris by the charming Mme. Rejane. The appeal here is as frankly to the military spirit and to the prevalent dislike of German manners as it is to national enthusiasm. Such a play as this, skilfully conceived, mounted, and acted, is in perfect accord with the spirit of the moment. And the triumph of *Alsace* at the Théâtre Rejane serves as a suggestion that France's chief danger just now seems to be a possible recurrence of that Chauvinism which, periodically, has turned Marianne's pretty head. Fortunately, the Republic has an able First Minister in Aristide Briand, and an able President in Raymond Poincaré. But the latter's hard-headed sanity may be put to severe strains before he has served out his seven years as Chief Executive.

Underpaid Women

The conditions of women workers brought to public attention during the garment makers' strike in New York City have imprest many newspaper writers as exceptional and surprising. This underpayment of women is not so very exceptional, and it ought not to have been at all surprising, since it has been for years the subject of Government investigation and has inspired a good many pages of the voluminous and thoro *Report on the Condition of Women and Child Wage-earners in the United States*, issued by the Department of Commerce and Labor in the years 1910, 1911 and 1912. While the various editorial writers do well to protest, as they are now doing, against the inhumanity of employing women at hard labor for excessive hours at $4 a week, they would have done still better had they begun the campaign several years ago. The information was perfectly accessible.



The facts detailed in the above mentioned report cover a much wider range and are of deeper significance than those brought out in the recent strike. A few points may be briefly indicated here. For one thing, the report completely shatters the "pin money" theory. Till the recent garment makers' strike made it clear that women had actually to live on those pitiful earnings, it was usual to hear people say, whenever such instances of low wages were cited, that they represented only pin money, the workers having other means of support. The report shows that the woman who goes

into industrial work for pin money is exceedingly rare. In the New York factories 88.1 per cent of the women employed contributed their entire earnings to the support of their families; in the New York stores the percentage was 84.3.

The following conditions were revealed by an investigation of a certain number of silk mills in Pennsylvania and New Jersey: In the Pennsylvania mills visited, 67.8 per cent of all employees were women and 23.2 per cent were children; in New Jersey the women were 49.6 per cent and the children were 6 per cent. In the throwing mills of New Jersey 8.7 per cent of the women over sixteen years of age received less than $4 a week and 15.8 per cent received between $4 and $5; of the girls under sixteen, 40.1 per cent received less than $4 and 41 per cent received between $4 and $5. In Pennsylvania conditions were much worse. There 57.2 per cent of the women over sixteen received less than $4, and 37.1 per cent between $4 and $5, and of the girls under sixteen, 91.6 per cent received less than $4 and 7.6 per cent between $4 and $5.

The Miracle of Spring

Speaking figuratively, we often talk about the burst of spring breaking the bonds of winter when we refer to the change from severe cold to warmer weather, without realizing the fact that there is an actual burst of spring in the germination of seeds and the opening of buds. You and I stand sometimes at the grave of a loved one and ask, "What mystery is this death; no one can explain it?" Was there ever anything more nonsensical? The mystery is in life, not in death. It is not mysterious that a little bit of matter should lie here before you without action, tho that particle be no larger than a seed of corn or of sunflower.

SPRING'S AWAKENING

Only a sunflower seed, but yet containing the prom ise and potency of future life.

In every seed apparently inert and dead is pent up a miracle waiting only for the triune application of air, warmth and moisture. It lies on your shelf with plenty of air surrounding it, but that is not enough. Put it in a warm, sunny window, and that is not enough. Throw it into a pan of cold water and that is not enough. It is

only a bit of apparently dead matter, but bring to bear upon it the trinity of air, warmth and moisture, then what a leap it makes into the unknown, what an astonishing burst into the unknown, tho familiar and commonplace. Look at the accompanying photograph of the bursting of a sunflower seed, that only a few hours ago was apparently as dead as a bit of metal. No mystery there, nothing to excite our attention. But in a folded damp cloth it was placed in a warm spot. Sufficient air was contained in the folds of the cloth, sufficient moisture brought to it by capillary attraction between the fibers of the cloth, and sufficient warmth penetrated the meshes, all three acting together to produce this astonishing spring miracle. Mother Nature had provided that around the plumule there should be stored a supply of food amply sufficient until the plant could grow a myriad root hairs with which to gather its own food.

In every tiny root hair, and in every cell of which it is composed, what mystery lies concealed. Bring these cells under the highest power microscope and the cell wall seems to be an impervious membrane. Nothing there resembles a sieve, and yet the moisture penetrated that membrane by the wonderful process that we call osmosis. Here is the beginning of new things. It is the renewal of life. Sunflowers of 1913 may be of the past, but they still live in their offspring. Generation after generation comes and goes. It is like a long wavy line that rises alternately to the hights of the adult, and then falls into the valley to begin all over again. But there is no phase, whether in growth, decay or pollination, more interesting or more strikingly beautiful than in the first attempts to rise again to the hights of life. It assures us that sunflowers may come and sunflowers may go, but sunflower life shall go on forever. More than the burst of the seed in the ground it is a burst of rays of hope in the human heart. EDWARD F. BIGELOW.

High School Students and Their Studies

There are some surprises in store for anyone who reads for the first time the reports of the United States Commissioner of Education in regard to secondary instruction in this country. Within the past two decades (1890-1910) the number of pupils in the secondary schools of America has more than trebled, increasing twice as fast as the population of the country. About 12 per cent of these remain to graduate, three-fifths of the graduating classes being composed of girls. Even this percentage of graduates represents an advance over the figures for preceding decades; but, on the other hand, the percentage of secondary school pupils preparing for college has decreased from 18.6 per cent to 6.8 per cent. According to distribution, it appears that the public high schools are increasing their enrolment very rapidly, as compared with other secondary schools; that, in spite of the drift of population to the cities, there is no appreciable increase at present in the relative proportion of secondary pupils in the urban high schools, as compared with the rural; and that Utah and Iowa lead the United States in their percentage of secondary school students, these being the only two States which have over 20 per 1000 of population.

Even more interesting is the proportionate change in the number of students taking various studies. There is a decline in the popularity of all of the science subjects except mathematics. On the other hand, the proportion of students taking Latin has rapidly increased, and now stands at over 50 per cent, running close to algebra at the top of the list. Of the other subjects, English literature, rhetoric, history, geometry and German show marked increases, French shows little change, and civics, like the natural sciences, a decrease.

New Aids for Our Life Savers

At an appointed time each year, a board of United States Government experts, specially detailed for the purpose, devotes a considerable interval to thoro examination and tests of all the new inventions that have been evolved during the twelvemonth for life-saving purposes. It is surprising how many novelties are submitted, but even more surprising how few of these candidates for Federal endorsement and adoption meet the varied requirements of the governmental arbiters. This very circumstance of the meager proportion of worthwhile innovations has tended to render the officials of the United States Life Saving Service conservative, even skeptical, regarding new departures in life-saving apparatus and equipment.

With due allowance for this very natural state of affairs, it will be appreciated that there is especial significance in a development of the past few years which has already well nigh revolutionized American life-saving methods and may be confidently counted upon to complete the transformation within a very few years. This radical influence is found in the introduction of power life and surf boats, replacing the

old-fashioned oared craft which were dependent upon the brawn of the rowers to propel them on a mission of succor. At the present time there are in service at United States life saving stations an aggregate of more than one hundred of these power boats, and additions are being made almost monthly. To be sure, something like one-third of the total number of power boats represent the old type of life-saving craft which have been converted by the installation of motors, but all the others were specially constructed as power boats in accordance with governmental designs which have been gradually revised until they approximate perfection.

UNCLE SAM'S NEW LIFE-SAVING POWER BOAT

Just here it may be noted as a matter for patriotic pride that the United States is far in advance of all other nations not only in the extent to which power boats have been adopted as vehicles of rescue and relief in maritime disaster, but in the capabilities and technical qualifications of the designs which have been evolved as a result of the lessons of practical experience. Only a few weeks ago our neighbor Canada announced that she would adopt the United States governmental models for her new power life-saving craft, and several other nations are evidently contemplating a similar endorsement. Great Britain and France, the only European nations that have introduced power life boats to any considerable extent, are accounted far behind the United States in the progress made in this field, altho it must be admitted that one of the British models is larger than anything in service on this side of the Atlantic, and the English may be accounted pioneers in this entire sphere, owing to their early experiments with steam as a motive power for life boats.

The officials of the United States Government were alert, say, a score of years ago, to the possibilities of power in life-saving craft, but the adoption of steam for such a purpose meant the sacrifice of the self-righting feature of the boat and none of the Yankee experts were willing to concede this. Accordingly, they awaited the development of the gasoline engine, but once this was an accomplished fact they lost no time in adapting it to life-saving craft. Investigation and experiment commenced in earnest about the beginning of the century and in the light of ever-widening practical service the evolution of types proceeded, until now Uncle Sam has approved types of motor life and surf boats that in every detail of hull design and mechanism exemplify that simplicity, durability and dependability so essential in a most exacting field of usefulness.

The standard American power life boat is 36 feet in length and 8 feet beam. It is provided with a 6-cylinder auto-marine engine, and this motor is so installed that it may be operated entirely from outside the engine room—a great convenience in heavy weather. The power surf boat of approved type is 25 feet in length and 7 feet breadth and has an 8-horsepower motor. The most interesting feature of the power surf boat is found in what are known as

adjustable propellers—twin screws so placed, thanks to movable propeller shafts, that they, at a moment's notice, may be drawn up into a protected position close against the hull. This ingenious arrangement permits the surf boat to be launched in shallow water, from a shelving beach or under other conditions that would be prohibitory to the heavier life boat with its rigid, exposed propellers.

Under severe and varying conditions, thruout the whole extent of our Atlantic, Pacific, Gulf and Great Lake coasts, these new power craft for the life savers have proven themselves most eloquently. In response to a call from the head of the Life Saving Service there have recently been received at the headquarters in Washington reports from the captains of the various life-saving crews, that constitute the most convincing testimony as to the superiority of these power boats over the old-timers that were dependent upon sails and oars. Dozens of different instances are cited in which rescues have been accomplisht, solely as a result of the speed of the power boats—lives saved that would have been lost with relief dependent upon the old style boats. And every captain in the service is more than enthusiastic, because the power boat enables his crew to reach a scene of disaster fresh for the labor of the hour instead of exhausted by a long pull at the oars in the face of a tempestuous sea.

WALDON FAWCETT.

What Congress Is Doing

In the closing hours of the session there was an unprecedented congestion of pending legislation. Owing to criticism of extravagance in appropriations, the passage of several bills was obstructed in the Senate by filibustering. It was understood that Mr. Fitzgerald had been congratulated by Mr. Wilson for his emphatic opposition in the House to the large appropriations. Altho the House committee reported in favor of two battleships, the House, by a vote of 174 to 156, preferred only one. The Senate, however, stood for two, by a vote of 56 to 16, and a conference was required. Mr. Taft has signed the bill for a physical valuation of railroad property. The cost of the work will be $3,000,000 or $4,000,000 and it will consume at least three years.

Mr. Taft vetoed the Webb bill, relating to the shipment of intoxicating liquors to States having prohibitory laws. He believed that it was unconstitutional. It was past over his veto by votes of 63 to 21 in the Senate, and 244 to 95 in the House, and is now a law. He sent to Congress a long message urging adoption of the budget system and pointing out the advantages to be gained by using it. A favorable report was made in the Senate upon the bill (past in the House) conferring American citizenship upon Porto Ricans. The House bill creating a new Department of Labor was past in the Senate, with amendments.

Mr. Wilson gave notice that the extra session would begin on April 1. Bills for the revision of several schedules of the tariff will be ready then. A few of Mr. Taft's nominations were confirmed in the Senate. Several of the Ministers in foreign countries, who rose to their positions by examination and promotion, will test their right to retain their places, under the civil service law. In the Senate the radical Democrats are a majority. Mr. Martin, of Virginia, will not be a candidate for reëlection to the office of floor leader and chairman of the caucus. His successor, probably, will be Mr. Kern, of Indiana.

The Situation in Mexico

There were many conflicting reports from Mexico, last week, concerning the attitude of several States whose officers had been loyal to Madero. They appeared, however, to be yielding slowly to Huerta's rule. In Coahuila, Governor Carranza persisted in rebellion. To Mr. Taft he sent a telegram asserting that Huerta's Government was a spurious one. Orozco, recently leader of a rebellion against Madero in the north, accepted Huerta, and his followers will be added to the Federal army. There were negotiations in the south with Zapata. His demands were too extravagant, and Huerta rejected them. Several of Zapata's lieutenants, however, yielded. Others were captured and put to death. Abram Gonzales, the deposed Governor of Chihuahua, was placed on trial for plotting revolution. He was set free, however, after he had promised to assist the Huerta Government. On the 2d, there was a revolt in a suburb of the capital. Huerta's machine guns killed nearly 100 of the rebels, and the uprising was at an end. Another rebel party had intercepted a troop train on its way to Cuernavaca and killed 55 Federal soldiers. Near Douglas, Ariz., there was a collision between Mexican soldiers and United States cavalrymen. Four of the Mexicans were killed. This took place on or very near the boundary.

The late President's father and uncle were permitted to sail from Vera Cruz for Cuba. They were followed by Madero's widow and mother. From Cuba, and apparently from members of the Madero

family, come stories about the killing of the deposed President and Vice-President. These stories are to the effect that the two men were murdered and shockingly mutilated in the palace; that their bodies were placed in an automobile, and that there really was no attack upon the escort. Ambassador Wilson, however, is inclined to accept Huerta's report, and Huerta has arrested six men alleged to have been among the assailants of the escorting party. Cuba has been asked to detain the Maderos. It is said that Huerta will seek to have them extradited for trial in Mexico.

There will be several candidates for the Presidency at the national election. Felix Diaz is the most prominent of them, and he has induced De la Barra to stand with him, for Vice-President. Others named are Rudolfo Reyes and Francisco Gomez. The national treasury was found to be nearly empty, and steps have been taken to negotiate a large loan. Our Government has placed 10,000 soldiers at or near Galveston. Owing to complaints from Americans in Matamoras, Governor Colquitt, of Texas, sent four companies of militia to Brownsville, and he was talking of protecting Texans at any cost, "without regard to the displeasure of the Washington authorities." Federal cavalry began to watch the militia. It became known that the Americans were in no danger, and the militia companies were withdrawn.

Futurist Literature

Post-Impressionist and Futurist art is discust in this issue by Professor Mather and the Editor, but since the point of view of neither is altogether sympathetic, it is only fair that we should let the new movement speak for itself. There is coming to be Futurist literature as well as a Futurist art, using words as unconventionally as pigments. Those of our readers who fail to understand the pictures herewith reproduced may be enlightened by a quotation from Gertrude Stein's character sketch of Henri Matisse, publisht in *Camera Work*. We regret we have space for only one sentence, but this will serve to illustrate the Futurist style:

This one was one very many were knowing some and very many were glad to meet him very many sometimes listened to him, some listened to him very often, there were some who listened to him, and he talked then and he told them then that certainly he had been one suffering and he was then being one trying to be certain that he was wrong in doing what he was doing and he had come then to be certain that he never would be certain that he was doing what it was wrong for him to be doing then and he was suffering then and he was certain that he would be one doing what he was doing and he was certain that he should be one doing what he was doing and he was certain that he would always be one suffering and this then made him certain this, that he would always be one suffering, this made him certain that he was expressing something being struggling and certainly very many were quite certain that he was greatly expressing something being struggling.

ADVERTISING AFFIRMATIONS
BY GEORGE FRENCH

VII.—"Results"

We hear much about results of advertising, but what are results? Is there anybody in the advertising business who can compute the results of good advertising, or estimate the damage done to business by bad advertising? If there is such a man, I would like to meet him.

All managers of the advertising departments of periodicals are compelled to listen to much solemn talk about "results," and much of it may be about "ascertained results." There is always the agent (manifest in the mail that comes about every morning in the year) who writes in melancholy vein about the "results" of the wee bit advertisement his client inserted in the periodical some time in the more or less dim and distant past, and laments thru two or three lines of typewritten words that he is really unable to give an order for that particular advertisement until the periodical is able to produce better "results." In the same mail there are sure to be letters from advertisers relating how their business had benefited thru advertising in the very same periodical.

But there are results and results, as there is advertising and advertising. Let us discharge from our mind all thought of one kind of results—that secured from advertisements that call for instant attention, such as mark-down sales of seasonable goods, retail trade, and that great field of advertising which deals with the foibles and weaknesses of people. The man who advertises a sure cure for colds must get immediate returns, and so must the man who advertises an oriental wonder-box. Such seekers for quick response to their pleas must carefully select their mediums, and they are justified in demanding that there shall be response to their every advertisement—if their advertisements are right.

But when we come to think about business-building publicity, it is folly to talk sagely about "returns" that can be detected and tabulated. The great office of advertising is business building, rather than exclusively the selling of goods. That advertising that will the most surely and scientifically build business cannot produce results that can be formulated and credited to the different publications in which the advertisements may have been printed. The shrewdest advertisers know this, and are never caught trying to reckon orders received thru any one medium. There are ways of correctly estimating the power of particular mediums. It is necessary to know how many readers they have and what sort of people those readers are. But that knowledge is only one element in a fair estimate of the advertising worth of periodicals.

There are at this time two forces at work trying to ascertain the real value of advertising mediums: One tries to get at the exact amount of the circulation of periodicals, and the other wishes more particularly to ascertain the character of their readers and the circumstances that led to their becoming readers. The attitude of the readers toward the periodical is of far more consequence to the business-building advertiser than the number of those readers. This principle is being adopted by many careful and successful advertisers. There must be numbers of readers, certainly. But mere numbers is not of such exclusive consequence. Interested readers, readers that stay with the periodicals because they are the kind of periodicals that they like—these are they who give value to circulations, and bring to advertisers who know how to advertise the only returns worth striving for. They build business. They are not likely to hasten to answer specific advertisements, but they buy the goods that are advertised in their favorite journals.

It may be assumed as having been proved that people who read periodicals because they think they need the matter printed in those periodicals, as a whole and continuously, also read the advertisements printed in those periodicals. It is getting to be known also that a person who buys a periodical because it makes a prize package of itself, or gives itself away, or because it is printing a risque story, does not, as a rule, read the advertisements printed therein. It is being recognized that the power for profit to the advertiser a periodical can develop depends more upon the quality of its circulation than upon the quantity of circulation it can claim. If readers are devoted to a periodical it will be a good advertising medium, and will produce the best possible "results" for the advertiser. But the advertiser who tries to check up sales or inquiries to specific insertions in particular mediums is spending his time in an exercise that tells him little regarding the effectiveness of his advertising.

IN THE INSURANCE WORLD

BY W E. UNDERWOOD

Companies Old and New

It is with pleasure that we give careful consideration, as fully as limited space will permit, to the views exprest by Mr. G. W. Van Fleet, president of the Peoria Life Insurance Company, of Peoria, Ill., who, recalling a piece of advice previously tendered by us on the subject of choosing a life company in which to insure, construes our observations as discriminatory, perhaps, against the newer and smaller companies. Nothing of the sort was intended by us, and what we offered was for general application only, useful in about the same way as the whist rule which admonishes the player in doubt to lead trumps.

Mr. Van Fleet is of the opinion that the newer and smaller companies, particularly those of the Middle West, are giving their policyholders as much security and better service than many of the large and old companies. This is so, he thinks, because the smaller companies come into more intimate relations with their policyholders and are consequently in better position to provide for their needs. He then observes: "The value of a life insurance policy is not so much in the company that issues the policy as it is in the contract itself, and the advantage the insured will have in getting direct service with the company carrying his contract."

In our former advice we said that the small companies should build up their business in their immediate home territory—their State, for example—and by patient industry and right dealing establish a reputation. So we are not greatly at variance with the opinions he expresses. But we cannot concur in the statement we quote above. It is true that—considering the matter from a legal viewpoint—the value of a life insurance policy rests in the terms contained in that contract. That, however, is neither all nor the chief value. Were we to indicate the factor which we think weighs heaviest in the scale of consideration, we should select character, by which we mean that spirit in the controlling management, as evidenced by its acts continued thru a period of time sufficiently long to raise them to the plane of tradition, which guarantees, preserves and protects the rights and equities of policyholders, whether they are or are not exprest in the contract, and whether the policyholders are conscious or ignorant of their existence. There are such companies. We are personally aware of benefits and privileges distributed indiscriminatingly among all at interest that were not provided for under the contract terms. They are the products of underwriting evolution and they exist as landmarks of life insurance progress. The non-forfeiture principle formulated by Amzi Dodd, resulting in automatic extension, which, after its adoption by his company, was applied to all the policies issued prior thereto, is but one illustration.

Doubtless there are many small companies which possess the valuable qualities indicated, but they have not as yet had the opportunity to demonstrate them. We are positive that some of them will do so, and we are just as sure that those which do will grow into that greatness which compels both success and admiration.

Two Washington Fire Companies

Majority and minority reports were submitted to the lower House of Congress last week by the Committee on District of Columbia, which has been investigating the management and affairs of the First National Fire Insurance Company and the Commercial Fire Insurance Company, both domiciled at Washington, and the conduct of the Insurance Department of the District under Insurance Superintendent George W. Ingham. The majority report is signed by Representatives Prouty, Redfield, and Berger; the minority report by Representatives Johnson and George. Both reports acquit the Insurance Superintendent of wrongdoing.

The majority report criticizes the management of the First National and Commercial companies, and asserts that they must be reorganized if they are to continue in business successfully; condemns the literature which was sent out by the promoters of the organizations for the purpose of securing buyers for their capital stock; vigorously arraigns the management for the contracts made with Tuttle, Weightman & Dudley to sell stock and procure business;

and censures the Commercial for paying dividends to stockholders in 1912, when, it is alleged, the losses previously sustained in the business absorbed all the surplus and left a financial deficit.

The minority report exonerates the management of the two companies and declares that nothing was developed in the course of the investigation indicating any wrongdoing on the part of any of the persons connected with them. In the matter of the value of the Southern building, which figures in the assets of the two companies and over which there has been some controversy, the minority report declares that its appraisal at $2,000,000, fixed by the representatives of the Insurance Department, was fully vindicated, and adds: "The financial condition of the companies is solvent beyond all sort of question and has never been otherwise."

There are not irreconcilable differences between these findings. The companies are doubtless solvent, and it is within reason to concede the valuation of the Southern building to be as claimed. It is also possible that the methods and literature of the promoters while organizing the companies may have been open to criticism; perhaps the contracts made with the managing underwriters were injudicious; and, certainly, the payment of dividends if none were earned, is censurable.

Hartford Steam Boiler Company

When account is made of the fact that the Hartford Steam Boiler Inspection and Insurance Company has strictly confined its activities—as its corporate title accurately implies—to the inspection and insurance of steam boilers, one is inclined to marvel at the importance it has attained as a financial institution. There would not seem to be a great opportunity in such a line of business so restricted, even in almost half a century, to build up a great body of assets, and yet from this company's latest financial statement (December 31, 1912) we find it in possession of assets aggregating $5,337,015; a net surplus of $1,925,595 and a surplus security to policyholders of $2,925,015.

The company prospered exceedingly during 1912, making substantial gains in every department of its work. The number of boilers protected by its service was greater by 13,160 than in 1911. Other gains were: Net premiums written, $134,811; premium reserves, $169,514; assets, $291,140; net surplus, $124,293; amount of insurance outstanding, $16,056,221.

A pioneer and creator in this line of work, the Hartford Steam Boiler has rendered a useful service to society and there is not a doubt that its inspections have saved millions of value and many human lives and limbs.

Questions and Answers

F. R., Brooklyn—

The owner of a building leases same to an individual for occupation as a private garage. The insurance policies on the building are written at the minimum rate for this class and contain the following warranty: "Warranted by the assured to be occupied as a private family stable and/or dwelling," as well as the necessary privilege to keep automobiles. The lessee installs a lathe, milling machine, drill press, emery wheel, etc., of considerable size, to be operated by electricity and to be used for repairing his automobiles and other private work. The electrical work will be approved. Does the installation of these machines, for private work only, increase the hazard or violate any condition of the policy?

The conditions you describe amount to an avoidance of the contract. The installation of the equipment mentioned, including presumably the storage and use of gasoline, increases the hazard, a fact the insurer must know and consent to by proper endorsement on the policy, and for which there will probably be exacted an additional premium.

C. G. Leiter, Mt. Gilead, O.—The company you name is in good financial condition, is carefully managed, has made satisfactory progress since it was organized and is capable of rendering excellent service to policyholders. Of course, it has its reputation to make. Judging by its past, its future is promising.

Notes

The validity of the New Jersey workmen's compensation law under the Federal and State constitutions is upheld in a decision of the New Jersey Supreme Court. The case was that of Floyd Sexton, an electric light lineman, who was killed on July 4, 1911, the day the law went into effect. The court holds that the act does not violate the Fourteenth Amendment of the Federal Constitution guaranteeing equal protection of the laws and that no person shall be deprived of property without due process of law, nor is it in violation of the provision of the State Constitution protecting the right of a citizen to trial before a jury. It is held that the right to a jury trial is inviolate but not unalterable; that it is a privilege which may be waived by either party. The facts involved in the case are not dealt with at any length, the court declaring that there was evidence to support the rulings of the trial judge.

FINANCE & TRADE

The Money Trust Inquiry

The report of the Pujo Money Trust committee, 75,000 words, was given to the public last week. It was preceded by a statement, about 10,000 words, sent to the committee by J. P. Morgan & Co. Both should be read by those who seek information as to the subject of the committee's inquiry. The committee found, not a money trust, in the strict meaning of the term, but a concentration of power with respect to credit, the issue of new securities, and other financial operations. There was no evidence, it said, of an abuse of this power (as related to certain specified operations), but the existence of it was fraught, with peril to our institutions. Many recommendations were made, and these were embodied in two very long bills, one relating to national banks, and the other to the stock exchanges in New York and elsewhere.

Parts of the bill concerning national banks ought to be enacted. They are designed to prevent the borrowing of a bank's funds by its officers, the participation of banks or their officers in stock promotions or underwritings, and certain other practices which had already been disapproved by sound public opinion. They seek also to compel incorporation of clearing house associations as to which, however, there is room for argument. Congress is asked to force incorporation of stock exchanges (the committee having in mind the exchange in New York) by forbidding the transmission by mail, telegraph or telephone, of any news concerning the transactions of an exchange that is not incorporated. At the same time the proposed bill provides that incorporation must be accompanied by numerous restrictions concerning exchange methods. These restrictions tend to promote publicity and to prevent certain abuses of speculation. One of them requires brokers to exact a margin of at least 20 per cent. The penalties proposed for violation of the law are severe. For example, "any person" who sends by mail a letter, or even a newspaper, conveying information as to sales on an unincorporated exchange may be imprisoned for two years! Such abuses as are found in stock exchanges should be attacked in some other way.

J. P. Morgan & Co.'s statement is a memorable contribution to the literature of this controversy. We regret that the limits of our space permit no more than a brief reference to it. The concentration to which the committee objects, it insists, is due to our antiquated banking system and to well known economic laws. The need and advantages of coöperation are pointed out. There are forcible answers to much that was publisht later in the report of the committee. We have been imprest by the firm's criticism of the assertion in the resolution, under which the committee acts, that it is "generally believed that these groups of financiers are enabled to create panics." The firm expresses regret that a belief "so incredible and abhorrent" as one that "the panic of 1907 was due to the machinations of certain powerful men should for a moment have found lodgment anywhere." So do we. A great many persons, however, do now believe that the panic was so caused. Their belief is due in part to the attitude of a majority of this committee and to assertions made in Washington before the resolution providing for the committee's inquiry was adopted.

Financial Notes

Imports free of duty in 1912, those from Hawaii and Porto Rico included, amounted to $1,084,000,000, or 54½ per cent of all the imports.

In the annual report of the trustees of the Steel Corporation's pension fund it is shown that the disbursements in 1912 were $358,780, against $281,457 in 1911.

Mr. Herrick, Ambassador to France, says that our farmers would gain more than $200,000,000 a year in interest charges by the establishment of agricultural credit societies. The average rate paid on farm loans here, is 8½ per cent. while it is only 4½ per cent. in Europe.

Issues of new securities in 1912, according to the tables of the *Journal of Commerce*, amounted to $2,253,587,300, against $1,730,487,720 in 1911, and $1,518,272,000 in 1910. Capital raised by railroad and traction companies amounted to $1,101,961,800, and the issues of industrial corporations were $1,151,625,500.

The New Cabinet

President Wilson could not well have avoided giving Mr. Bryan an invitation to enter his Cabinet. Mr. Bryan, now in the prime of life, has thrice been the nominee of his party for the Presidency. On this account and for other reasons he has in recent years been the most prominent Democrat in the United States. If he had not been asked to become Secretary of State, a great number of Democrats would have been offended. He has been accustomed to criticize the course of his party in Congress. At times he has sought vigorously to shape that course. In the Cabinet he will refrain from making such attempts, and harmony may thus be promoted. There are predictions that he will soon be in conflict with his chief on questions of policy. We are by no means confident that these predictions will be fulfilled. While we cannot agree with Mr. Bryan as to some of his financial beliefs and theories—which, of course, will now be laid aside—or concerning his views about the Philippines, we are glad to express our conviction that he will continuously exert his influence to promote international peace and the settlement of international disputes by arbitration. He desires peace as earnestly as Mr. Taft desired it, and he will be as ready as Mr. Taft was to support the agencies by which peace may be preserved. His policy with respect to Mexico—and in this he will represent the President—will be, we are confident, like that of Mr. Taft, and we expect to see him and the President going as far as Mr. Taft went in seeking comprehensive peace agreements with other great nations. We regret that he has opposed what the hostile critics of it have called the "dollar diplomacy." There is much to commend in such diplomacy. Our fiscal experiment in Santo Domingo is an example of it.

The new Secretary of the Treasury, Mr. McAdoo, who has had little to do with politics, brings to his office a lawyer's training, supplemented by exceptional executive ability, shown in the direction and completion of a great work with which his name will always be associated. He has earned the respect and confidence of our most eminent financiers. He is sane and competent. Mr. Redfield, Secretary of Commerce, adds to an experience of thirty years in manufacturing an exceptional familiarity with tariff questions and an acquaintance with the management of large corporations, of which he is an officer or trustee. Mr. McReynolds, the new Attorney General, is qualified by his service, as a special assistant of his predecessor, in the prosecution of important suits under the Sherman Act. As to his ability there is no room for doubt. Mr. Hueston, Secretary of Agriculture, recently chancellor of a thriving university, has been connected, as a prominent officer, with several institutions in which agriculture is taught. His record indicates that he is specially qualified for the place. It is to his credit that he now publicly expresses his respect for

the veteran who preceded him and his appreciation of that veteran's work.

Mr. Daniels, Secretary of the Navy, was recently urging his friends in Congress, we understand, to vote for two battleships instead of one. Here he may be at variance with Mr. Bryan, who was saying a few days ago that our country should set an example by beginning the work of disarmament. Mr. Lane, Secretary of the Interior, has been a strong man in the Interstate Commerce Commission. Several of the commission's reports and decisions upon important questions were written by him. We understand that his opinions as to conservation and other subjects with which his department is concerned are all that can be desired. Mr. Garrison, a distinguished lawyer who has had judicial experience, is an intimate and trusted friend of the President. As to his ability and sound judgment there is no question, and in all probability he will be a satisfactory Secretary of War. Mr. Burleson, Postmaster General, has served in Congress for fourteen years. Mr. Wilson, the head of the new Department of Labor, began to earn his living as a coal miner, and for several years was secretary-treasurer of the Coal Miners' National Union. For two terms he has been in Congress, where he has sought to procure the passage of bills relating to workingmen.

While its quality is still to be tested, we are inclined to regard the Cabinet as a good one. The members of it are comparatively young; the average of their ages is less than fifty-one years. There are indications that they will work harmoniously in support of the policy of their party and their chief.

For Disarmament

We have elsewhere reported the Greek victory in the capture of Janina. It is of great importance, but not of so great importance as is the military stress in Germany and France.

Germany announced a large increase of her standing army. Then France followed with three years instead of two for her conscripts—and all young men are conscripts. Now Germany decides to spend half a billion dollars more on defense and pay for it in war taxes, a fearful burden. France accepted her added burden as with smiles of glory, but Germany groans but submits, and fails to subscribe to the new Prussian loan. With this fresh imposition she fears financial panic and the check of her industrial growth. The burden to France will be very heavy, and the Socialists are beginning to grumble. And this oppressive burden is all unnecessary; neither Germany nor France wants war.

The inspired German journals say it is all because of the rise of a new Slav foe, the sudden appearance of the allied Slav States which have shown such military genius. Their confederacy alters the balance of power in Europe. The danger of German against Slav is dreaded. We do not believe it, tho it is easy to say that in a war in which Germany might be involved with Russia aided by France and the Balkan powers, Austria could give little aid, being taken up with her own difficulties, with Bosnia rebellious; and that Italy could not be depended upon. True, if Germany or Russia should seek war, but why should they? It is their own matter; they can prevent it; why not suppose the sky should fall?

This is the time for a constructive peace policy by the United States. It will not be enough for President Wilson and Secretary Bryan to do what President Taft tried to do with the arbitration treaties and failed; that of course. But they are in a good position to present to the nations a plan for the reduction of armaments. The United States has refused to engage in this rivalry. It will not build two dreadnoughts. England will readily join us in the next Hague Conference, or before, in asking the nations to do themselves the favor of reducing instead of increasing their suicidal waste of war in times of peace. Here is room for leadership and service and glory.

When Our Resources Are Gone

The cost of living has struck the well-to-do. The price of gasoline has doubled and is still soaring. The latest statistics of highway homicides do not show yet any marked decrease of the death rate among pedestrians, but that may be expected to appear later. As for the curtailment of other pleasurable activities maintained by gasoline, that also may be anticipated. Mr. Rockefeller is reported to have remarked that he would enjoy a motor boat this summer, but that fuel will probably be too expensive for him to afford it.

Doubtless some trust or other will be held responsible for this restriction of the enjoyments of the rich. But they will be mistaken if they attach too much importance to that cause. Gasoline is going up really because the supply of crude oil is running low. We all remember how wrong-headed we were when we attributed the advancing prices of beefsteak and ham to meat trusts and packing houses. It turned out that the real cause of the advance was a shortage of meat stock on the hoof. Ranches had been going out of the cattle business. The ranges had been fenced off and devoted to intensive farming. And the worst of it was, and is, that the good old cowboy days, with butcher shop prices to suit, will never come back. Nor will farmers ever again raise oxen, but will sell their male calves for veal. Mankind must look into a limitless future of less steak and more beans. Something very like this gustatory calamity is surely now falling upon the "car class." Like the "walking class" it is face to face with an actual shortage of the stuff it wants. No restraint of "the restraint of trade" will help the matter. Beeves and hogs and gasoline are not adequately produced, and apparently they can't be, any more.

Is this mock tragedy or the real thing? We are afraid that it is a first chapter of the real thing. Less than a generation ago the world regarded the natural resources and opportunities at man's disposal as inexhaustible. That the plains and pampas of South and North America could ever be other than a boundless pasture was inconceivable. That the mills and mountains of these continents could ever be stripped and desolated like the hills of Palestine and Syria, that once were of matchless beauty, was beyond belief. That the iron and the copper, the coal and the oil in the bowels of the earth could ever be exhausted, was a nightmare. But men who so thought have lived to encounter another thought that was "coming" to them, tho they did not know it.

The cheerful optimist who "thinks that he thinks" is still as ready as ever he was to demonstrate that all fear of actual suffering because of inadequate raw material for men's mills and his stomach is groundless and absurd. He reminds us that science has not begun to master the possibilities of production by highly artificial processes. The inexhaustible free nitrogen of the atmosphere can be fixt and turned into the soil for the production of such crops as no "natural" farmer ever imagined. Meat and grain will some day be "made" as well as "grown." Electricity will do so much work for us that we shall have to kill time, and so on, and so on.

We say that this particular kind of an optimist thinks that he thinks. Actually he does not think, and if we understand him, he can't think. Quite true it is that science enables us to do amazing things, and may enable us to do things yet more wonderful. But how? Not by wishing them, or willing them, or calling them into existence from the void. We do astonishing things by the aid of science only if we have most complicated and costly mechanisms and combinations of material to do them with. What shall the free nitrogen profit us if we run short of the chemical substance wherewith to entice and fix it? How shall we "make" foodstuffs, and wood, and textiles, instead of growing them, if we lack any one of the raw materials entering into the sum of ingredients? How

shall our work be done by electricity when iron and copper are no longer to be had in commercial quantities? Isn't it about time to grasp the idea that all this talk about substituting artificial for natural products is nothing but the same world-old nonsense that mankind has fooled itself with from the beginning, about the possibility of making something out of nothing?

We are genuinely and profoundly glad that the "car class" has got to pay top prices for gasoline. The shock of the experience may possibly help the twentieth century business hustler to realize what the stupid and wicked waste of natural resources is doing for us—and to us.

Temptations

There is an old petition, often repeated, and often without thought, "Lead us not into temptation." There have been publisht during the past week two notable reports of the temptations into which people are led.

One of these investigations is by a woman who has been deputed to visit the homes of New York policemen, to see whether they appear to be living decently on the wages given them by the city. Especially she has visited the homes of the younger married policemen, who enter the service with a salary of $800. She has talked with their wives, has seen their homes, has studied their expenses, and she finds, with scarce an exception, that there is no sign of graft. They live very cheaply. Their uniforms and dues cost them about $200 the first year. For six or eight years they are likely to be in debt, and they seek the position because it is permanent and promises a pension. That is evidence in favor of a general pension system. As young children come the expense is increased. But the evidence shows that they are honest, manly men, and that whatever the temptation to seek unworthy methods of increasing their income, they do live honestly, and in the first years with difficulty, within their income except for debt.

The other investigation is being carried on in Chicago as to the condition of girls employed as clerks. Particularly the question of wages is raised, and the possibility of living honestly on the wages given. Both girls and employers have been questioned.

The girls are of two classes, those that live at home and those that have no home and live in rented rooms. The wages of young errand girls, twelve or fourteen years old, begin at three dollars a week. These girls all live in their homes. They are protected at home and are young and under no special added temptation. Their wages are a valued addition to the family income. As they grow older their wages rise to five, eight or ten dollars. There are employers who will employ only girls living at home, where their wages help to support the household. If the family has other wage earners, they are under no special temptation beyond that of their own frivolity. But the case is otherwise with those who live by themselves in a hired room. Then, while possibly they can keep soul and body together on five dollars, it is difficult to get the attractive clothes which their work requires and which a girl loves, on that wage. Beyond question many go astray, for they have to resist constant temptations. It is for these that society should care, both by seeing to it that living wages are assured, and also that by the Y. W. C. A., or otherwise, large buildings are provided in which homeless girls can have decent rooms at a cheap rate and where they will be properly protected. This is a crying need in a hundred cities. As we are having women's hotels, so we need women's apartment houses to match the Mills hotels for men.

National Quarantine

The new Governor of New York State is reported by the daily press to be considering seriously the question of putting the administration of the quarantine of the port of New York under the control of the Federal Government. Undoubtedly a move in

this direction is proper and is in line with recent advances in sanitary matters and will do good in every way. There are now but two cities of the country—New York and Boston—in which the control of quarantine remains in the hands of the local authorities. In recent years one after another the ports of coast line sea and gulf have placed themselves under the control of the United States Public Health Service and none of them have had any reason to regret it. On the contrary there has been a feeling of security engendered by this action which of itself means much, and all those who are authorities in sanitation have welcomed this transfer from local to national control.

The New York Academy of Medicine appointed a committee some time ago to investigate the question of having the port of New York in all quarantine matters under the authority of the general government, and the recent report of that committee adduces all the reasons for which the change should be made and makes it very clear that it is eminently desirable. At the present time all the other details of the administration of this principal port of the country except quarantine are in the hands of the Federal Government. Few realize to how many departments of our municipal marine station federal control extends. Military protection against foreign invasion is of course under the Federal Government. Besides this the Treasury Department has charge of the inspection of vessels entering and leaving the port, of the examination of pilots, and of course of the protection of the country against the entrance of undesirable immigrants as far as that can be secured. Besides, it has charge of the drainage and lighting of the port. Such questions as those of the length of piers, the erection of bridges across the North River, the maintenance of the channel, are all under federal control.

It is almost an anomaly then to have the protection against invasion by epidemic disease from abroad in the hands of the local authorities. As has been said, this is absolutely the only detail of the administration of the port still under local officials. As is pointed out by the committee of the New York Academy of Medicine this is exactly the one department in which local control carries with it most disadvantages and dangers. Effective quarantine is much better established and maintained by specially trained scientific experts, appointed for life and certain of tenure of office during good behavior and efficient service, than by appointees who may change with every political alteration of the State administration. It is eminently desirable that the position of Health Officer of the Port should be taken out of politics. We have been very fortunate in our health officers in the past and they have given such efficient service as to make their departments models in many ways. It is perfectly possible, however, at any time that thru local political influence some one should be appointed to the position quite incapable of filling it. The office makes special demands on the administrative ability as well as the medical knowledge of the individual who holds it. Only a really big man, and even he must be especially gifted, can hold it successfully now that the quarantine of the port has become such an immense undertaking involving so much responsibility.

Besides, it is quite unfair that New York State should be asked to pay the whole amount of the cost of our quarantine here. The quarantine protects not alone ourselves, but the whole country. There is more danger of the invasion of epidemic disease from abroad thru New York because of the large number of immigrants that come thru this port and our world wide commerce than anywhere else. The budget for next year's expenditures is over $2,300,000. That expense should be shared by the 100,000,000 of inhabitants of the country, and not be borne by the less than 10,000,000 in New York. Other States recognized this in handing over their quarantine

to the general Government and New York should now do the same thing. It seems not unlikely that before long Boston also will appreciate the advantages of federal control and the disadvantages of the present system, and then we shall have the whole quarantine of the country, as it should be, entirely under the national Government.

In recent years the public health service has proved its efficiency in quarantine and sanitary matters. What has been accomplished for New Orleans is a typical example of what can be achieved and what confidence is aroused by federal control. It is to the Public Health Service that we owe the cleaning up of the Canal Zone at Panama and the changing of what was the pest hole of the tropics to what is almost a health resort. The death rate of the Canal Zone is now below that of most of the cities of the country, even those that were supposed to be most healthy, and, while the age of its inhabitants makes the conditions particularly favorable to health, experience in the past has shown what almost infinite possibilities for ill health even for the young and strong and vigorous Panama may present. The change to federal control, then, would seem not only to be justified by the matter of expense and other reasons, but actually to be demanded on the score of efficiency, security and the definite placing of responsibility where the best guarantees for its fulfilment can be given.

For Restraint of Marriage

If we are to have laws for the restraint of marriage they should not be enacted ignorantly or by a trick. Legislation by a trick does not pay, and, fortunately, is not often possible, particularly since various interests have agents at Washington and at State capitals to keep a sharp watch on projected legislation. In this country the trick usually is to put inconspicuously in a bill a provision which would not be allowed if it were observed. In the British Parliament one way is, to send out notices to members of a party to be all on hand and spring a vote when the other side can be caught napping.

A bill was the other day put thru the lower House of Congress, almost unobserved and unopposed, and without any public hearing in committee, that we believe could not have past if its purpose were known. It forbade in the District of Columbia the marriage of any white person to any negro, Chinese, Japanese, Malay or Hindu, but not American Indian. The penalty for contracting such a marriage would be imprisonment for not less than two years or a fine of $500, or both, and the marriage shall be null and void. If the parties should go outside of the District of Columbia to be married, on their return they would be prosecuted and punished and the marriage annulled.

We trust no such bill can pass the present Senate, and it surely ought to be vetoed by any president. It is a law against human liberty in a matter of bare prejudice of caste. It is not a law against passion or illicit relations, but against decency and morality in the relations of sex.

Marriage is a matter of taste. The children of a white man or woman with a negro or Mongolian are as likely to be decent or moral as are those of a white or a negro or a Mongolian couple. Further, this and similar laws in the States are directed chiefly against marriages of white people with mulattos or quadroons or others with a smaller trace of negro blood who would largely pass for white, for Spaniards or Creoles or Italians. This shows that the purpose is to maintain caste supremacy, to humiliate those who have any negro blood.

Most unfortunately in a number of Northern States laws against intermarriage have been introduced. Some of these Western States fear Mongolians will corrupt the pure Anglo-Saxon blood. We are especially surprised that such decent States as Kansas and Iowa should allow such a

bill to pass thru its Assembly, and we would warn other States against the effort to meddle with what is none of their business.

The Two Parades

Last week the President of the United States was inaugurated, and a long-drawn-out parade occupied for hours Pennsylvania avenue from curb to curb, and only the sidewalks were given over to the spectators.

The day before was the women's parade. The police gave them no protection. The crowd of people filled the street from curb to curb as well as the sidewalks, leaving only a narrow lane cleared by the Fort Myer cavalry, thru which the women painfully forced their way, sometimes not able to walk more than two abreast. And the suffrage parade was beautiful, when one could see it, excellently thought out, artistic, and well carried out, dignified and impressive; beautiful floats, fine color effects, handsome banners, a credit to those who had planned and arranged everything, with the stamp of women's thought all over it. That it should not have been accorded the common courtesy of a right of way was no reflection on the parade itself, but on the miserable inefficiency or mischievous malice of the police of the city, who will have to suffer for it, if Congress has its way. The cause is likely to be advanced as much by its harassments as it would have been by its full artistic display. The American sense of fair play must be aroused by persecution, and win championship out of indifference or hostility.

The Spirit of the Age

The other day we happened upon a news item to the effect that Mr. So and So, who had been a United States district attorney, principally engaged in the prosecution of offenders against the Pure Food and Drugs Act, had resigned his office and entered into a partnership with Blank & Blank for the practice of law. The news item concluded with the statement that Mr. So and So would specialize in cases arising under the Pure Food and Drugs Act.

The significance of that news item is in the last sentence. Mr. So and So has presumably become exceptionally familiar with decisions and precedents connected with pure food legislation; he knows the cunning sophistications resorted to by deliberate violators of the law; he knows how the law may most successfully be attacked and the points where the cases of violators are most in need of strengthening. Armed with this knowledge, acquired in the service of the people, he is now about to "specialize in cases arising under the law."

Does this mean that he is now about to give his matured powers to the effort to secure progressive betterment of conditions in the preparation and vending of necessary foods and drugs? Possibly, but if that be his aim we might reasonably expect him to remain in the Government service, becoming continually more efficient in the enforcement of higher standards as he gathered experience in his office. As a prosecutor his place will be filled, and the Government will employ his successor to prevent adulteration and punish offenders.

Yet obviously he does not expect to be idle; and, since he will not be engaged in the defense of the law, the only other way in which he can "specialize in cases arising under the Pure Food and Drugs Act" will be in defense of those charged with violating it, frequently with deliberate, cold-blooded intention, actuated by mercenary motives. In fact, everyone will understand that this news item is evidently an advertisement holding out the services of a specially trained advocate to those who for sinister reasons have need of just such knowledge and abilities, and to very few others.

Will this attorney be widely and severely censured for his changed attitude toward a vital statute? Will his friends regard him with aversion and treat him with coldness? Will public morality sustain a shock, as tho it had discovered a traitor to public wel-

fare? The questions scarcely need answer. His friends will congratulate him and wish him good fortune (which may mean ill fortune to many thousands), and other persons will look upon it as quite the natural thing to do in the pursuit of life, liberty and "getting it." He will still be regarded as a useful and respectable member of society, and there will be no general feeling that his weekday work and his Sunday conscience cannot live together in mutually amiable toleration. Perhaps here and there some cranky, hypercritical soul may reject the common standard and insist that morally this man is equally guilty with those who are engaged in destroying health, and sometimes life, for what is to be gained thereby, and who are fortified in malevolent practices by the cunning of just such "specialists in cases arising" under this and other laws.

And that is what is the matter with us. This picture of the people dancing around the image of a golden calf set up in the midst of them is typical of the moral blindness with which we are afflicted and which is the prolific source of the material evils of which we complain. When condemnation of the prostitution of ability to the service of wrongdoing is as spontaneous as condonation is now, then the New Jerusalem will be in sight.

British Opium in China

The history of opium is a long one, reaching from the time when with it Hercules put to sleep the three heads of Cerberus. The later history of it has been a sad one, for it has not only been the curse of the Far East, as alcohol has been of the West, but it has been the cause of quarrel and even war between the greatest of pagan and the greatest of Christian empires, in which Great Britain has been all wrong and China all right.

That long quarrel is now near its end, but still sympathy must go more to China than to Great Britain. British India supplies the opium of the world, as our Southern States supply the cotton. By far the largest part of this product is exported to China for the purpose of debauching its people. But a very large part of the income of the Indian budget is derived from opium; and therefore the Indian Government, and the British behind it, have not wished this trade reduced. China, however, knows the terrible nature of the use of opium, and has, at last, forbidden the growth of the poppy by her own farmers, and has secured a treaty with Great Britain under which the amount of opium imports shall be progressively reduced. At the same time she has closed shops and resorts for the sale or smoking of opium, and forbids and punishes its use. It was in 1906 that the crusade against opium began, with the decree, and with provisions annexed, requiring the vice to be utterly eradicated in ten years and importation to cease. The republic disqualifies all opium smokers from holding office or voting.

Of course it would do no good to forbid the production of native opium if foreign opium could be freely admitted. In 1907 another agreement made the reduction in the amount of imported opium depend on the Chinese good faith in reducing the production of native opium; and in 1911 a further agreement allowed any province which entirely suppprest production to forbid admission to imported opium. The purpose on both sides was to put an end finally to the use of the drug; but it left open the question whether China really did her part faithfully. The Indian Government did its part strictly. It bought all the opium produced, and sold it, only to the amount agreed on, to British merchants, who took it to Hong Kong and Shanghai. Meanwhile the price of opium rose immensely, and the Indian Government received a higher profit on a reduced amount, and the merchants bought to the limit as a gambling venture.

But it is clear that the Chinese Government has been desperately in earnest to do what nobody believed it could do, and what no nation has done in the suppression of alcoholic bever-

ages. This year the opium brought to the Chinese ports cannot be sold. The amount in storage there is valued at from $60,000,000 to $75,000,000, on which the banks have loaned money to the merchants at high interest. Immense losses are sure to follow, unless, as the merchants request, Great Britain tries to force China to forbid exclusion of opium from the provinces. The consuls are besieged to make protests to Peking, and appeal for help is made to Sir Edward Grey in London. It has been even urged that the British Government should buy the opium and relieve the merchants.

But the sympathy of the entire world is with China, and it is sure that the British Parliament would not approve any attempt to help the merchants at the expense of China—so much has the sense of justice and humanity grown in international affairs. The merchants ran their own risks, and we observe that they get little sympathy in the English journals publisht in the East. It is believed and hoped that China will persist in her effort to save her people; and her success in stamping out this terrible evil might well encourage Western nations to do as much. Particularly do we commend the example of the provinces of China to the attention of such of our prohibition States as Kansas and Maine, which hope to get from a Democratic Congress a constitutional law allowing them to forbid the admission of alcoholic liquors, such as they have not been able to get from a Republican Congress.

In Brief

Auction catalogs make interesting reading, in their errors as well as in their information. In one book list before us we read, among the works of Mr. Roosevelt, *Hunting the Grisly*. Yet the ex-President is not a morbid writer. In the same catalog we read the title of a certain little masterpiece translated from the Provençal as *Aucassin and Picolette*. One cannot help wondering whether the heroine is not related to Peregrine Pickle—a character named in at least one eighteenth century translation of Smollett into French, "Sir Williams Pickle." But most diverting of all the catalog misprints is that which gives as the author of a list of plays one Colley *Cribber*. This is a mistake with a sting in its tail!

We wonder if the Irish of Ireland are good Catholics. Hear what their leader in Parliament, Mr. Dillon, said at the third reading of the Welsh Disestablishment Bill:

> We Irish Catholics are Free Churchmen to the tips of our fingers. We are Free Churchmen in principle, and we are against establishment and state endowment. . . . In supporting our friends in Wales we are carrying out the very principles which, if the occasion arose to-morrow, would guide us in connection with the affairs of our own Church.

That is fine; and we seem to remember similar expressions from archbishops in this country. But what says the Syllabus of Pope Pius IX? We read this as one of the condemned propositions: *"Ecclesia a Statu, Status ab Ecclesia sejungendus est;"* "That the Church should be separated from the State, the State from the Church." Dillon glories to his finger-tips in the condemned proposition.

The facts given as to the working of the suffrage laws of Louisiana illustrate the suppression of the negro vote in the entire State. The city of Shreveport has 14,000 colored citizens. Of these only thirty-nine had been qualified to vote. When they came to vote each one was told that his name was not on the poll-book, and that he must go to the courthouse and get a certificate and attach it to his ballot. This, of course, made it easy in counting the ballots to see how they had voted.

We are glad to have Alfred Noyes, the English poet, visiting us and lecturing on poetry. He has somewhat surprised his hearers by saying that in England there is a tendency to forget Wordsworth and Tennyson and Browning and follow after new gods; that poets seize the torch only to belabor with it those from whom they take it, and then dance down to posterity in a blaze of Bengal lights; and that the visitor to this country is surprised to find that the Victorian poets are still honored. Whom can he mean to attack? Can it be Kipling?

The Filipinos do not seem to be much oppressed. Our tyrannical government there has not prevented the Speaker of their Assembly from sending a message to President Wilson asking of him the fulfilment of the pledge of the Democratic platform for independence. We shall see; certainly not in the special session which will be given up to the tariff.

There must be no more "movies" and magic lantern shows exhibited in Catholic churches, says a late decree from the Vatican. The reason given is that these edifices are "dedicated to God, and in them are celebrated the divine mysteries, and the faithful are lifted to celestial and supernatural things," and it is not fitting that they should be turned to "scenic performances, even tho proper and pious." Yet they are a great attraction to young folks.

It is an important announcement made by Dr. St. Clair McKelway, who succeeds Ambassador Reid as Chancellor of the University of the State of New York, that the City College is to be expanded so as to have branches in other boroughs of the city besides Manhattan, and to enlarge its courses of instruction and develop into a university. It will have the support of wealth and population equal to those of half a dozen States.

For their part in rebellion not one man who took up arms in our Civil War was executed. Jefferson Davis was spared and set free. Already in Mexico the President, Madero, and one of his brothers have been killed, and the Vice-President. Were any one inclined to write a *Sentimental Journey* thru our neighbor republic, he would not be able to begin, as did Laurence Sterne, "They order this matter better" in Mexico.

Is it a good sign that meetings of college graduates should be called "smokers"? Could not a less vulgar name be found for them? Do we not remember the statistics in the *Popular Science Monthly* not very long ago which showed that about 70 per cent of the college students who got the highest marks were non-smokers, while about 70 per cent of students with the lowest marks were smokers?

We are not imprest by the literature of the Luther Burbank Society, which is seeking members at $100 each to raise a fund to help Mr. Burbank's investigations. The society promises Mr. Burbank's book with his autograph, and one of its stories is of the production of corn 16 feet high and with thirty-two ears.

The amazing German scheme of military expenditure for the next year, a full half billion dollars, is enough to frighten the taxpayer and might justify revolution. France has to follow Germany, but, as we write, our Congress will give no heed to the folly which multiplies battleships to protect us against an invasion from the planet Mars.

Can it be, is it credible, that the Metho- appointed to investigate. Jonah's whale that corrupt the orthodoxy of the faithful, and that the head of the concern is actually writing such books? Prodigious! So say ministers in South Jersey, and a committee is appointed to investigate. Jonah's whale must be protected.

The Webb liquor act is beginning to work. We have reports from several prohibition States of consignments of liquor arrested, and cases are sure to go to the courts for test of the constitutionality of the act. If the provision in the Constitution for the "general welfare" of the people can be sufficiently stretched it will stand.

Of Joaquin Miller's home, ten miles from San Francisco, he told a visitor: "As you know, I live on the Hights—I spell it without an *e* to save ink and time"—a very good reason—high, hight. That *e* has no business there, and already we have got quite used to dropping it, as one of these days we shall drop the ugly *gh*.

A physical sign of the change that has come over China in a year is noted by an American who, on his return after an absence of five years, remarks that he has not seen in Shanghai a single Chinese with a queue. They are gone as badges of Manchu servitude; and European dress is rapidly being assumed.

Does economy require the reissue of half cents, as a bill which past the House requires? They think so in England, where last year 7,669,760 brass farthings came from the mint, and a farthing is half a cent.

The Hungarian half of the Austrian Empire is more progressive than is the German half. Its lower House of Parliament has voted to give the suffrage to a considerable class of women.

President Taft retires to a five thousand dollar post, and his private secretary gets a twenty thousand dollar salary in insurance. But there is honor in a university professorship to balance it.

John Morley gave some pretty frank talk to the House of Lords the other day. Said he, "One might as well talk to the House of Lords about land as to a butcher about Lent."

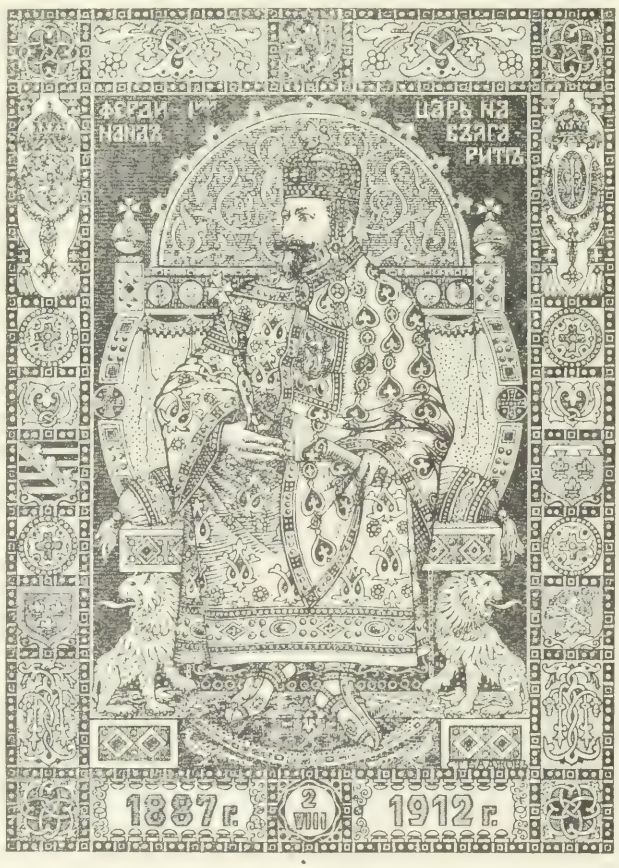
President Wilson deserves only praise for refusing to give his time to hearing applications for office, and referring applicants and their friends to the heads of departments.

Austria and the Balkan Alliance

By Andrea S. Tsanoff

[The approaching end of the Balkan war will open a new phase of the Near Eastern Question, in which Austria's claims will be sure to play a leading part. The following article is of interest, as it reflects the estimate in which Austria is held by the Balkan people, who regard her as the evil genius of their alliance. The writer is competent to speak for his nation on this subject. Educated at Amherst and Cornell, he has for the last forty years been preaching Anglo-Saxon ideals to his country. His experiences in the United States of America made him a pioneer champion of the United States of the Balkans. He has been a member of the Bulgarian Parliament, for twenty-two years professor in the American Institute at Samokov, and for the last twelve years editor of the Philippopolis *Zornitza*, the oldest Bulgarian paper.—EDITOR.]

Last October, on the eve of the Balkan war, Count von Berchtold, the Austrian Minister of Foreign Affairs, told the Bulgarian Government that the territorial integrity of European Turkey would be preserved irrespective of the actual outcome of the then impending struggle. When, ignoring this threat, the Balkan allies began the war, and the whole world was amazed at their whirlwind campaign, Austria alone (and perhaps one other power) failed to share in the joyous astonishment with which civilized humanity watched the Turk's exit. During the peace negotiations at London, Austria, and the Triple Alliance behind Austria, set in operation the entire apparatus of diplomatic intrigue, to postpone the surrender of the Moslem. And now when, compelled to resume the war, the allies are writing Finis at the gates of Constantinople, it is Austria again who remains the evil genius, seeking to frustrate the Balkan coalition by contriving Albanian questions in the west and Rumanian dangers to the north. The Viennese press has sought to offset the harrowing record of Mohammedan atrocities by circulating libelous legends of Servian outrages in Macedonia. So cunningly indeed has the Austrian editor played his part that many well-meaning persons have come to see in the Government of Vienna the civilizing agency in the Balkans; so that even in THE INDEPENDENT, H. A. Gibbons, for example, could ask the American public to comprehend and sympathize with Austria's Balkan policy.



That policy remains now as the most sinister factor in the whole Balkan situation, threatening complications fraught with the gravest possibilities. It is of interest, therefore, to inquire into the motives of that policy, and to examine briefly the relative rights of Austria and of the Balkan Alliance to hold council over the conquered lands and to decide who should rule and where.

The lands liberated and held by the Balkan Alliance are lands which the allies have inhabited ever since Balkan history began to be written. Twelve hundred years ago our fathers tilled that rich soil, and for fifteen generations the tide of Turkish barbarism exhausted itself in keeping us submerged. While Western Europe saw Renaissance and Reformation and modern culture, we kept the Moslem busy reconquering us. And now when, by joint gigantic effort, we have rolled the Turk back to Asia, is Austria going to step in and rob us of the liberty which is the fruit of our late victory?

"Show me one case," Gladstone declared, "where Austria ever did good to any people." In the Balkans Austria has ever played the part of a vulture. No country has proclaimed the Turkish *statu quo* so loudly as Austria; no country has so cynically violated it when opportunity offered. Ever since the Slavs saved Vienna, Austria has watched the retreating Turk and marked her road to the Aegean Sea. But what are her historical, ethnic, or ethical rights in the Balkans? She never owned a square foot of the territory now contested; the only Austrians there are consuls and military attaches and spies. The time has passed, moreover, when Austria can pretend to play the role of missionary of civilization in the Balkans. The Sofia Government, which supports Turkish schools in Bulgaria,

and whose treatment of the Mohammedan population has been such that they have constantly supported Bulgaria in her present war with Islam, has little good to learn from the Government of Vienna, which suppresses Bohemian schools and which has made its own Slavonic constituents its hottest enemies.

A single look at the map of Europe will show the necessity of an Adriatic outlet for Servia. Every pound of trade which Servia exports to Western Europe has to go either to or thru Vienna. The recent Viennese enthusiasm over Albanian liberty is merely Austria's plan of retaining Servia in this economic vassalage. It may be that the natural port for the kingdom of Servia is the Bosnian Ragusa and not the Albanian Durazzo. But it was precisely Austria's appropriation of the two Servian provinces in 1908 which shut Servia from Ragusa and so compelled her to seek an Adriatic window further south. It is a double stroke which Vienna attempts now—to checkmate Servia's advance to the sea and at the same time gain in Albania another Balkan province. For only lunatics can fail to grasp what sort of an Albania is being concocted in Vienna—a discordant, chaotic Albania, which will speedily call for Austria's pacifying offices.

JUBILEE POSTCARD
Commemorating the twenty-fifth anniversary of Czar Ferdinand.

And, while the Albanian question is fomented to frustrate Servia and Montenegro, Viennese diplomacy pulls the wires that will rob Greece of the Aegean Islands, thus also saving for future dispensation another possible staircase to Asia Minor. Even in the same manner is rising Bulgaria to be humbled by Rumanian compensations. The question of rewarding Rumania for remaining neutral in a war in which neutrality was the very least which the allies could expect from a civilized nation needs no discussion here. But Austria's cunning is significant. By the same scheme Bulgaria is being harassed and Rumania's eyes are turned away from the provinces of Transylvania and Bukowina, where the double monarchy is systematically suppressing the native Rumanian population.

Turkey is the Sick Man, whom Austria has not wished to die until she could bury him in her own back yard. But Austria's type of doctoring suggests also the motive of self-preservation. For Austria-Hungary herself is the next Sick Man of Europe. Eleven million Germans try to rule twenty-four million Slavs by methods which make the Slavic provinces of Franz Josef resemble Ottoman vilayets. When one remembers that the Balkan Alliance is predominantly Slavic, and that Bosnia, Herzegovina, Croatia and Dalmatia belong geographically and ethnically within the Balkan Alliance, another reason becomes obvious why Austria seeks to thwart the racial aspirations of her own two dozen million Slavs by trampling in the dirt the South-Slavic coalition in the Balkans.

But precisely on that account the Balkan Alliance comes forth as a strong factor for true European peace. Only the continued power of the Balkan coalition can put an end to the peace-menacing Near-Eastern Question. Today the Balkan nations demand the recognition of their allied sovereignty, political and economic. Tomorrow they will hold the balance of power between the Triple Entente and the Triple Alliance. Their deepest desire is for peace; they have fought this agonizing war in order that anarchy may end in the Balkans and peace begin. It behooves America, champion of world peace, to recognize in the United States of the Balkans her first European daughter, for the new Bulgaria owes much to American influences and example.

Philippopolis, Bulgaria.

The Silver Tea-Set

By Gertrude Huntington McGiffert

The worth of things lies not within themselves
But in such thoughts as they do move us to.
A trifle made by fond remembrance dear
The costliest substitute cannot replace.
How personal the dower of the dead!
Their relics virtue have and things they loved
A sanctity that fain would move our tears,
And so remembers us of their sweet charm
We cannot credit matter outlives soul.

Thus hath this Silver Service potency
That doth avail to keep tradition green,
Like as a symbol past from sire to son.
And she who last reigned o'er it, queen of queens—
I used to think I'd paint her as she sat
Behind the Silver Tea-set pouring tea.
She always looked as she had just stepped down
From a great portrait in the billiard hall.
Her white hair fell in curls each side her brow
Whereon was sweetly written "Motherhood";
Brave eyes she had and gentle courtly mien,
And she was stately as she should command.
I was not quite afraid of her, but kept
My childish eyes upon her steadfastly.
Famed was her household for its gracious ways
(And every day there were sweet rusks for me).
We drank from rare blue cups that somehow seemed
Insignia of caste and like herself
The fit associate of patriots.
I never see blue porcelain anywhere
But brings beloved figures from the past,
Old feasts and frolics, voices long since hushed,
Bright bubbling kettle, scent of steaming tea,
And visions of the faces at the board.
Thus did her children's children homage pay,
And with their tea they drank her faith, her pride—
A glad and daily sacrament of love.

New York City.

The Gilds of New Clairvaux

The Country Problem Studied as the Story of Eternal Democracy

By E. P. Pressey

[Our readers will remember Mr. Pressey's article, "How Idealists Colonized a Hill Country," publisht December 5, 1912, on the interesting experiment in community living which he is conducting in Massachusetts.—EDITOR.]

New Clairvaux has succeeded, in a great degree which seemed hardly possible a dozen years ago, in reviving the eternal gild spirit. It was felt that coöperation was the one thing needful for the redemption of the country town, but that "coöperation" was no magic word to conjure by. When exaggerated, unnatural individualism and all varieties of the social disease, egoism, are rife, general coöperation is hardly to be expected after merely saying: Come, let us coöperate. "First comes the blade; then the ear; and finally the full corn." The revival of the gild spirit and method is the sum and substance of the mastery of coöperation.

To know this definitely one must first go over that part of the eternal story which is concerned with the power of the gild in the development of our race until now. After that we can talk more convincingly of New Clairvaux.

"Gild" is the oldest social word in our language. It means a meal, the social act of two or more persons breaking bread together. This is the historic rock of modern democracy. The word was further associated early with covenants, "ath and wed," between persons breaking bread together and perhaps solemnizing agreements with blood sacrifice. A still further development of the primitive gild was the "frith bohr," or peace pledge, taken by groups of strong men in a community to regulate and reduce communal disorder.

The same word, "wedding," in the Saxon language expresses the sacred agreement between husband and wife and covenanted comrades in arms or any public offices. Further, an element of blood kinship, of still more primitive origin, enters into the relationship. The earliest Saxon communities were still living in blood related clans. Agreements were of the nature of family obligations, confirmed by oath and "wedding" and witnessed by the kindred. All the feelings of "blood thicker than water" and awe of religious mystery were forces in the crystallization of the gilds into a social system.

And while we wonder, the past still flows by, an uninterrupted vision of continuous brotherhoods and transitions to greater brotherhoods, the lesser being taken up into the greater gild. The common meal of the early Teutons became the symbol of every form of association in war and peace. Both temporary and permanent undertakings were organized by it. The mystery of every craft was enlarged by it. Around it grew the lore of gods and heroes. Severally these first fraternities were conservative of all the good of the old times and steadily added to it until they came up against the greater mystery of Christianity and were partially dissolved in its light.

Again in the Middle Ages the gilds reappear with Christian habiliments of saints to take the place of pagan demigods; pageants on patron saints' days in place of sacrifices on gods' days; and gild-hall feasts of gild brothers and their families in scarlet livery for the most ancient covenant of gild mates. The institution became the crowning feature of the Middle Ages. Still the medieval gild was not final. It only contained the working machinery of secular democracy for which we value it.

As we trace the growth of the gilds down thru the Middle Ages we see more and more the influence of

Christianity upon the everyday matters which it found already in the world, upon trade and work, pleasure, government and the social fabric. The tendency all the time is, while sanctifying the very bond which held the clan, to lift it to national uses, and thru the nations to the organization of the world. The gild of Saint Thomas or Saint George, which paraded the street in scarlet livery and emblems which were masterpieces of craftsmanship on Corpus Christi Day and enacted scenes from the Crucifixion, or at Christmastide the story of the shepherds, or at sundry times the Creation or some Bible drama, were not very different from those processions, from pagan times immemorial, expressing the life in common, except that they incorporated male and female, rich and poor, tribesman and alien, into one communion.

When these gilds became strong enough they were commissioned by the king's government to keep the local peace. Thus the bailiff and the reeve were representatives of both natural and constituted government. The local gild defined in its by-laws the standards of weight and measure and the quality of materials used in all the trades, and sent its own sealers about. It made a standard for fences, regulated the driving of cattle on the public lands, established a law for hunters, with reeves in each department to enforce the same. It standardized workmanship and even required new dwellings to come up to the architectural dignity of that stage of civilization. The gild in return for all its privileges dealt kindly with the poor.

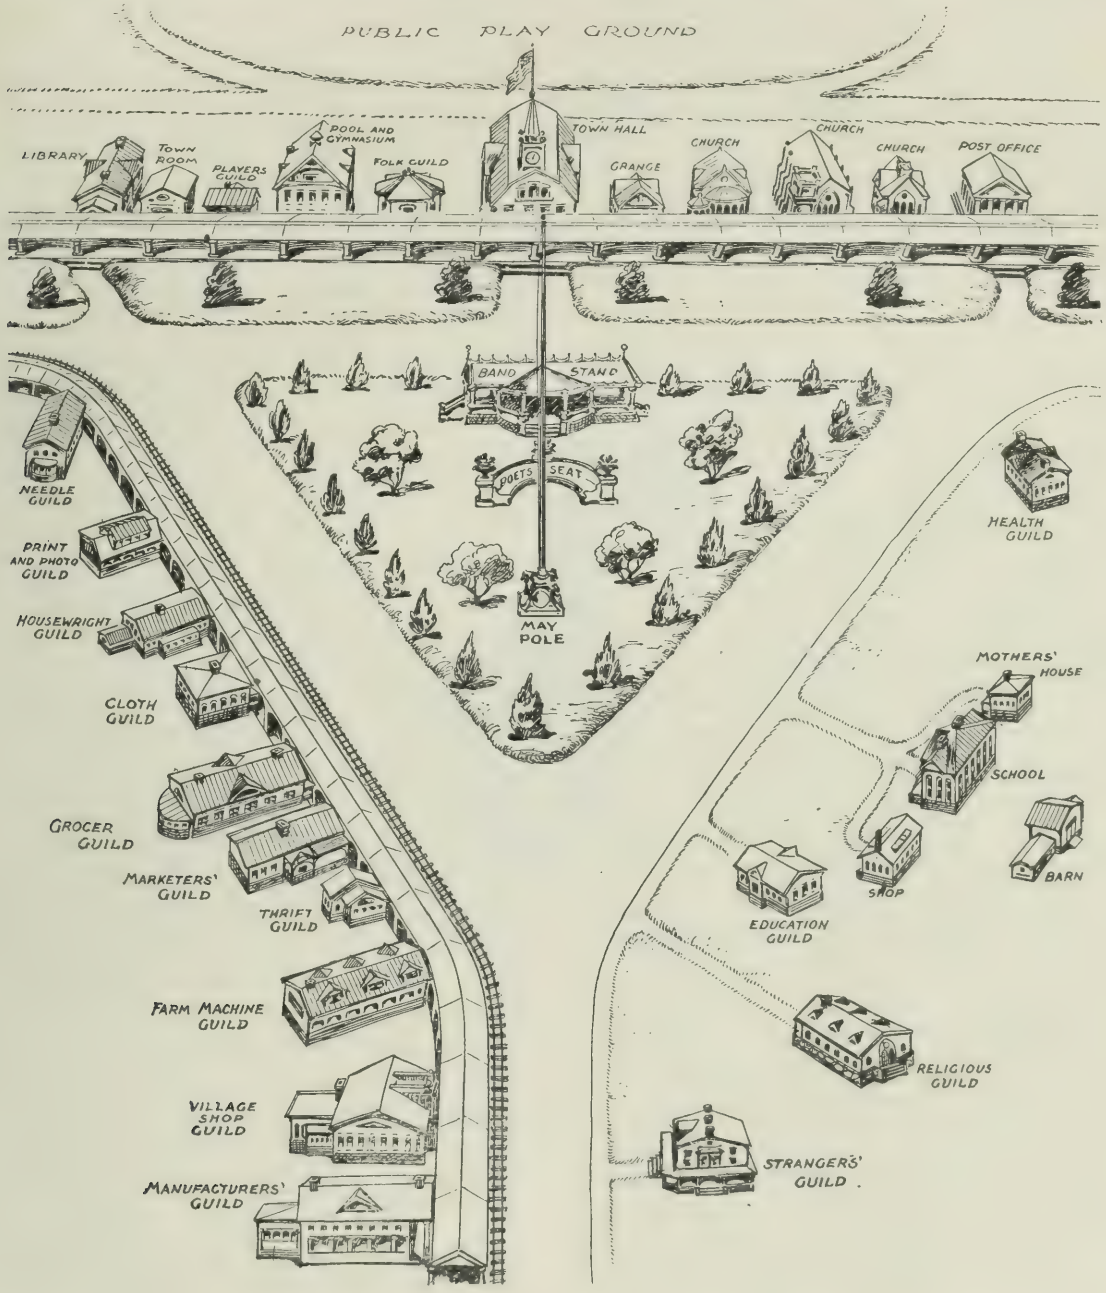
The gild's poor law was often compendious, covering all the functions of insurance against accident, poverty and old age. Besides, the gild administered bequests and raised funds by trade in real estate and cattle to provide dowries for indigent girls and trades for indigent boys, as well as to supply a loan fund to start young householders in agriculture.

Each occupation had its own roll of requirements, under the gild system of society. This roll went into the technical details of the occupation and was called the "mystery." Among the most perfectly kept rolls from quite ancient times were the crafts "mysteries." In these wonderful rolls, besides matters already mentioned, were the lists of tools required to be owned by every journeyman and master craftsman, in order further to effectualize the law of good workmanship. Preëminent among the crafts "mysteries" was that of the masons. This was the most highly internationalized also. It had worked out the most perfect discipline in its fellowship, by making every fellow at home among fellow masons in every city of Christendom. Of all the gilds the masons gave themselves most devotedly to the service of the Church, almost like bands of devotees or artists with a single aim. It was by them that the cathedrals were built, in close coöperation with the religious orders and the Church, backed by the vision of faith and faithfulness of the common people. One thing was not included in the roll, or "mystery." There was a mystery within the "mystery" and that was the experience of the masters who in every city and hamlet gave the savor of consummate art to everything medieval. This was taught by word of mouth. And when the gilds were broken up, as in England by the Tudors, it began to be lost.

There is just one more important strand in the rope which joins the ancient neighborhood life with the modern. And that is the connection of the gild with the parish church and the New England country town. The medieval and ancient gild ostensibly devoted itself to some religious work just as the most primitive pagan gilds had done before the introduction of Christianity. Now the vow of the gild was to build a chapel or to keep the feast and pageant of the patron saint. Usually if the gild was wealthy enough it was to support a priest as its own religious adviser, and, if not, to supply a fund in coöperation with the nearest church or chapel. Sometimes the gild donated

the furniture of the church or contributed the workmanship of some part of the building. In general, the central purpose of the gild was to promote instruction in religious traditions and to keep quick the sense of reverence for noblest things. In one breath the gilds were, thru the Scripture shows, moralities and brilliant processions, the moving picture of their age and the lineal progenitors of the New England town democracy.

We found the times ripe for a new "togetherness," a hunger for the common meal. So for a decade we preached this gospel in fifty communities; spent self and substance exemplifying it in one. Not every one believed, but the seed sown is now bearing abundant fruit.



There is probably no community in which the gild spirit has been recovered so rapidly as in Montague under the initiative of New Clairvaux. A dozen years ago the only mutual associations of a non-sectarian nature were a literary club of some twenty years' standing, with a dozen active members and which is still agoing, and a coöperative creamery, which failed after a brilliant record of a few years. Now it would be difficult to make a complete list, including the numerous tentative movements to get together for group interests. An observant and social Englishman, Captain Ellis, who is familiar with varied parts of the English-speaking world and who passed last winter here, exprest his bewilderment at the innumerable committee meetings during an average Montague week. The town, in short, has been for some years busily resolving itself into gilds which in due process involve themselves into one great gild, The Town. Twice at least last season the gilds joined in a general function representing every creed, race and condition; once to celebrate the musical pageant, *The Pied Piper of Hamelin,* and again in a monster Giving Festival, Christmas week. In both instances every school child and young person in town had active parts and a large group of committees of parents and citizens directed. Young, old and middle-aged worked and afterward danced together. There were those, more active in these folk entertainments directly than myself, who came and congratulated me, a quiet spectator, saying: "This is the outcome of New Clairvaux." I introduced the Giving Festival in much its present form and interested practically the whole town in it, in 1899 and in 1900. The citizens from time to time since then have taken the initiative in some form of a town Christmas less satisfactory, and last year revived the Giving Festival with wonderful choral singing and splendid features, exhibiting real growth in ten years in community spirit.

During the past year "The Village Committee" of gild union has given a wonderful reproduction, out of doors, of Shakspere's "As You Like It," and published a little weekly penny sheet, "The Montague Calendar," besides causing two public service corporations to treat the public considerately.

The Montague gilds I have thought of in three groups, which I have imagined in their future development ideally represented with headquarters around the village common, in something like the plan shown in the accompanying diagram. The relation of this diagram to the present facts is not at first glance apparent. I will explain. The gild headquarters here shown are actual or attempted solutions of problems of country life represented as facing each other on the main village square, as well they might if we were to start building now, giving forethought in the spirit of the age to architectural plan to the village "forum," however modest and inexpensive the buildings.

On the north side of the square is the group of public buildings and the gilds most closely associated with their service. The buildings are of any form or size, but are given a community bond and dignity by a uniform pillared arcade joining all in a single front. The Folk Gild is our gild union, "The Village Committee."

Sub-gild of this is the Dramatic Committee, which runs the Village Stage. The Players Gild has not yet been born, but should be the outcome of the work of the Dramatic Committee, providing a modest headquarters

for the care of stage properties and for a homey workshop for the players. The Village Gymnasium is the property of the Young Men's Club. The Pool has not yet been realized, but "The Village Committee" has provided for a skating pond. This arrangement of churches in an overchurched town I believe would do more for the reunion of Christendom than would the subscription to one creed. I see no harm in the multiplication of churches under proportional material surroundings and organic relationship to the whole community. I would not have any overweening steeples in this. The town hall crowns this facade with its tower and bears the village clock and bell, and the flag.

On the southeast side of the common, on a spacious green, is the twentieth century school, together with the educational and humanizing gilds. We have tentatively organized a committee to conduct a Mothers' Gild in coöperation with the school. An agricultural high school under a board of town trustees for several years unsuccessfully superseded the New

Clairvaux Plantations and Crafts School, occupying quarters in the village school, the Grange hall and the New Clairvaux Village Shop, with land donated by the town. The indications now are the interests of agriculture will next be taken up by a gild or gilds for fostering agriculture. The Grange, while important, must be classed with the purely social gilds, with ideals leaning to the soil. The Education Gild does not actually exist. It is a union of members of the school board past and present and of teachers and parents. It provides a home for the principal or superintendent of schools and a clubroom. The Health Gild provides headquarters for the board of health and a town dispensary, with offices of all the local doctors, and conducts a short course of lectures on health and sanitation of farmhouses annually. This also is a dream. The Religious Gild provides a home for a non-sectarian ministry-at-large for saving work and play from irreligion, for uplifting community life and politics, the role undertaken now for a dozen years by New Clairvaux. The Strangers' Gild has been several times attempted under the names of New Clairvaux Lodge, etc., to provide strangers and sojourners who want it a share in the best country life. It was hoped perhaps to solve the old problem of the small country hotel, supported in the main by a liquor nuisance. A public-spirited citizen of another Massachusetts town solved the problem by endowing an inn at his native village. There is a growing feeling at large that something of this kind can be done; and there can be no doubt that ultimately the Strangers' Lodge will become a permanent and much prized institution, both for its moral and business effects.

The southwest side of the common is the bazar. Here are connected by one covered walk all the business places. New Clairvaux initiated the Arts and Crafts movement in Montague, which has shaped itself into a number of strong gilds of some importance to the town in a business way. The oldest and largest of these is the Montague Arts and Crafts, formerly the New Clairvaux Arts and Crafts Society. This is just as active as ever, with an increase of business continually for the past ten years. The membership of this gild averages about thirty. Another of these gilds is a cooperative manufacturing society organized by a group of my associates in New Clairvaux and the Village Shop.

A very little has been done toward stimulating the farmers to form in groups to spray orchards and other crops. Two groups have been organized here and a third is in process of getting after the neglected orchards coöperatively. Other important gilds in our scheme were clubs for buying groceries and supplies wholesale and distributing from a central depot. Some groups of farmers have actually joined in buying fertilizers and chemicals by the carload. One of our dreams is a Thrift Gild which shall be both a mutual banking concern, serving the whole community at a moderate compensation, and a board of receivers for managing or advising the owners of unsuccessful farm property. Another gild much needed is the Marketers' Gild, employing an expert general commissioner for disposing of farm produce profitably.

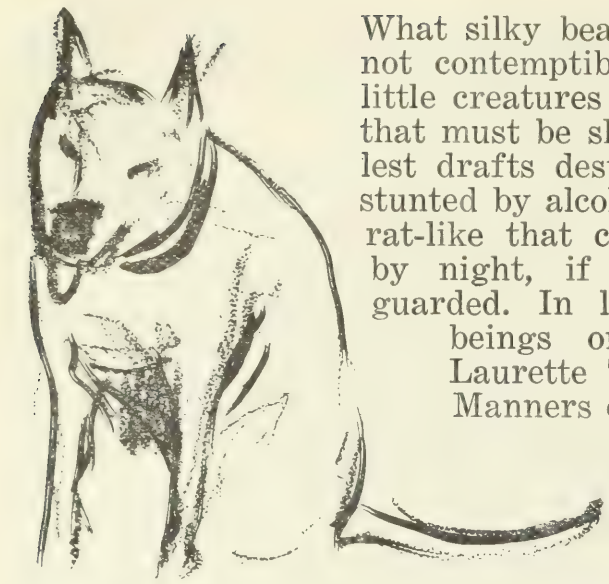
In regard to the center of the diagram, we have a town band; we want a town poet; our Folk Gild will undoubtedly revive the May games in the spring.

Montague, Mass.

Dogs in Town

By René Laidlaw

ILLUSTRATED BY C. R. WEED.



As civilization hardens there is less and less room for the horse and the dog. Burglar alarm and motor car little by little usurp the place and fulfil the utility of these old-fashioned animals. Yet we can never grow to *love* the man-made inventions; and I pity the children who are brought up today among mechanical toys, instead of among animals, as you and I were. Love is left out of the machine—which commands astonishment or appeals to our purses, but leaves emotion unstirred. That fact explains why some of us still cling to the horse, figuratively, and, in some of our riding, literally, too; why we still breed dogs, in country or suburbs; and even crave dog company in the city, which is no place for the faithful companion that a good dog is. The city cat is not to be pitied any more than the English sparrow that she makes a meal of. A cat never becomes a part of its environment, as does the dog; if we feed it, or it can find food, it is as properly urban as rural. It is even more characteristically nasty in cities, for that matter. But what cat ever became finally identified with its milieu? In town or country, wheat field or back yard, this animal practises the odious philosophy of Felix le Dantec. True, the beast seems peculiarly at home in a painting by one of Holland's Little Masters: a Metsu, for example. But it is, as often as not, depicted by the painter as stealing fish. Most justly, too! It is quite different with the hound. Look for him in painting and he is either doing a dog's work in the world, or lying at some one's feet, looking inextinguishable devotion.

The dog must have been domesticated hundreds or thousands of years before his natural enemy. Either that, or the animal brought to his vocation as the friend of man an infinitely greater capacity for abnegation and service. Fashions change, but not the loyalty of this disinterested comrade. Fashions in dogs change, too; and at the late dog show in New York—that of the Westminster Kennel Club—nothing was more noticeable than the utter passing of such breeds as the old-time mastiff and overrated Newfoundland. The Boston bull, too, has lost, for some reason (or for no reason at all), a measure of his vogue. Fashions apply above all to ladies' dogs—and perhaps the Bostons have been *almost* a lady's dog. Interesting as the Chows are (to pass on), one cannot help thinking them too exotic in all their qualities to serve as Nature's daily pet. Women choose them, one fancies, like parasols, to harmonize with a gown.

What silky beauty! Yet Chows are not contemptible animals, like the little creatures with falsetto voices, that must be shown in a glass case lest drafts destroy them; toy dogs stunted by alcohol in puppyhood, so rat-like that cats pounce on them by night, if they so much as take the air unguarded. In looking at some of these fluffy little beings one remembers the lines which Miss Laurette Taylor speaks in a new play by Hartley Manners called *Peg o' My Heart:* "If a dog has got to be a dog, it's my opinion he ought to *look* like a dog. I thought yours was your knittin' till he wagged his tail."

For my part, I dislike any animal smaller than a sprightly wire-haired fox-terrier. Isn't this the smallest dog that has any workmanlike traits? And I dislike dogs that wear sweaters and ribbons in their hair, like the French poodles; also most dogs with retrousse noses that sniff snobbery—like the spaniels. The homeliness of the Airedales and Irish terriers, for all the world like improvisations out of rope-ends, is a part of their honest charm. Some say they are rovers and fighters: so much the more dog they. These little vices of his aren't the explanation of the Airedale's failure to carry off the special prize this year, that he won in 1912, but lost the other day to a big bull. At dog shows it isn't moral character that counts—any more than elsewhere in the society that has a capital S.

But the bulldog is, all the same, the dog of all dogs for me: and I am prejudiced enough to prefer French bulls to English. Was there ever any animal so diabolically attractive as a jet French bull? Englishmen and Americans are reputed to be the dog-men par excellence. Yet it is a Parisian born and bred who has best exprest the philosophy and insouciant humor of dogginess — Anatole France in his *Pensees de Riquet;* and a Belgian who writes French is he who has written the one dog essay that brings tears to my eyes. I speak of Maurice Maeterlinck. You know the passage if you have read the *Double Garden:*

I lost, the other day, a little bulldog. He had just rounded out the sixth month of his short existence. He had no biography. His intelligent eyes were opened to regard the world and to love men; then were closed again on the unjust secrets of death.

Pelleas had a wide forehead, furrowed and mighty, like Socrates and Paul Verlaine; and under a little black nose, as snub as a displeased affirmation, broad, symmetrical jaws, making his head a sort of massy menace: obstinate, pensive, triangular. He was beautiful like a beautiful natural monster strictly conforming to the laws of his kind. And what a smile of attentive obligance, of incorruptible

innocence, of affectionate submission, of boundless gratitude, and of total surrender, illumined, at the least caress, his adorable mask of ugliness! Whence, precisely, emanated this smile?

I quote no more—you may read *Our Friend the Dog* for yourselves. I do not know that Mrs. Turner, who judged the bulldogs at the Westminster Kennel Show, would have awarded Pelleas a ribbon in the puppy class; for that matter I do not care any more than M. Maeterlinck would. Ribbons do not count with the dog-lover unless he happens to import a professional spirit into his friendship. But I hope that some of us will remember the ancient fidelity of these pathetically loyal animals when police departments and burglar alarms and city flats have done their worst, and the practical value of the quadruped is no longer to be argued. I cannot think that the dog loves his master on practical or even wholly reasonable grounds.

And are we, then, to fail to equal him in generous instinct, in the *elan idealiste?*

New York City.

A Dialog

By Mary Russell Mills

In dim gray sweeps with murmurous swell
The sad sea rose and fell;
In shining, foaming, sparkling grace
The glad sea ran a race.
In deep waves billowing soft and long
The sweet sea sang a song;
In fury lashed with thunderous roar
The mad sea struck the shore.

"O sea," I cried, "art thou no friend
On whom I can depend?
When I would find thee thus or so
Other thy mood doth show."

"I am thy friend," the sea replied,
"In every mood and tide;
For thou, too, hast a changing heart
Of wh'ch I am a part.
Thy mind doth change and shift and play
With every passing day.
And thou hast ever-varying powers
To match the varying hours.
I show thyself, but not the whole;
For in thy deeper soul
Dwells a large synthesis and plan,
Wherein the higher man
Collects, commands his powers at will,
Works steadily and still;
In patience, love and large control
Finding the perfect goal."

"O sea, my friend," again I cried,
"On every wave and tide
Thou bearest me a word of grace;
And I can wisdom trace
In all these words. In my own life
Lie power, and calm and strife.
In my own nature dwelleth all
To please or to appal;
Victim or ruler I may be
Of my own destiny.
Greatness and beauty of the sea,
As thou, too, art in me,
I will be beautiful and great
And serve the larger fate."

Los Angeles, Cal.

If I Were a Pastor Again

By a Retired Methodist Preacher

It is nearly two years now since I was superannuated. I shall not repeat the story of my sorrow and mortification when I was told by my presiding elder that the cabinet thought I ought to take the retired relation. I am glad that I do not have to pass thru that experience again. The acuteness of my grief is past, and while the sorrow remains, there is no bitter repining. I have many things for which to be grateful, and about these I would think rather than about what I have lost, or never had. I am glad that I was permitted to give thirty-three years to the pastorate. I am grateful that at the end of each year my presiding elder was able to say truthfully, when my name was called at our Conference sessions, "Nothing against him." It is pleasant to think that much of my work was done among the lowly. I love to think of the many homes into which I have gone, and of the kindness I have received because I came to the household as a man of God.

And our home becomes more and more a real home to us. We accept it all the more cheerfully because, but for an unfortunate effort to help others, we might have had a home that was really ours by right of purchase. A beautiful vine shades the front porch. Our friends have added a back porch and another room to the house since we came. We had a bountiful garden last Summer, and my good wife has succeeded well with her chickens. We have put out some fruit trees and shall put out more ntxa fall. We are glad to surrender one side of the front yard to Bermuda grass, which is the clover of the South, and the other side already has rose bushes, some violets and asters and lilacs, all planted since we came. And by and by, some maples set out on the sidewalk, a china tree and an apple tree in the front yard will give us shade in the summer. In the back yard there is a white locust, a young peach tree and a fig bush which grows luxuriantly, and we are planning a grape arbor over one of the garden walks. We have had the broad back porch screened in, and it is a good summer dining room, a nice sleeping porch on sultry nights and a most convenient work room for all of us in open weather. Our neighbors still seem to love us, we find work enough in our home and in the local church, and, meanwhile, realize that best of all pleasures—that which comes from a consciousness of labor worthy and worthily done. Our little book store has not as yet yielded much pecuniary profit, but we have found occupation and recreation in it, the business gives us access to the best periodicals of the day and we hope for larger things in the future.

It is unfortunate that many of the best lessons of life are learned so late that we cannot realize all the benefit that we need to get from them. My two years in the pew have taught me some things that I only knew in part while I was in the pastorate. If it were possible, I believe it would be time well spent if every pastor could take a year off, sit in the pew with the people, get thoroly in touch with them, study the sermons he hears, not as a critic, but with the one question uppermost in his thought, "What do the people need?" and then go back to the pulpit with experiences which could not fail to profit himself and those to whom he preached. There is an aloofness about the pulpit that sometimes puts a preacher out of real and vital sympathy with his hearers. Imagination cannot supply this sympathy. To fancy yourself in the pew will not answer the purpose. Mingling socially and in a pastoral way with men will not always and fully supply the needed heart touch. Possibly the large success of young

pastors is in part due to the fact that they have not studied themselves away from the people. The lessons that I have learned in the pew and some that I have gathered from the pastors themselves, as I have associated with them in a sympathetic and not participating way in their work, make me wish that I was a pastor again that I might profit by what I have learned.

For one thing, taking what I have learned from the pastors first, I think that preachers are too reckless and unbrotherly often in what they say about each other. They gossip too much. I have heard some of them talk in a most disparaging way about other preachers even in public places. A friend of mine received an appointment some years since to one of the most important places in our Conference. I said something like this to him the first time I saw him afterwards, "You will have some surprises in the near future in the attitude of preachers toward you. Some that have been friendly with you always heretofore will grow strangely cold, and some others that have not been at all intimate with you in the past will suddenly become suspiciously friendly and familiar." And I have the undesired satisfaction of knowing that all that I predicted has literally come to pass, and more than was carried in my warning. Certainly, of all men in the wide world preachers should be the most brotherly. Their calling separates, or should separate them from all that is selfish and worldly and sinful, and consecrates them to all that is good and true and holy. And surely a brotherhood that rests upon such high principles ought to form a bond of union between them stronger than any human brotherhood. Of course I do not mean to say that this brotherhood is a failure. But I am sure that it is not always as restraining and constraining as it needs to be. Personally I think I have suffered as little as any preacher in our Conference from the criticisms of other preachers. And yet, I am inclined to attribute my superannuation, coming so suddenly and when I was so little prepared for it, to misinformation and consequent misstatements on the part of the preachers concerning my defective sight. My brethren have appraised my work at its full value. But coupling my work with my infirmity, kindly meaning to magnify the former, they succeeded in magnifying the latter. Their praises have sometimes reminded me of Dr. Samuel Johnson's comment on the dancing of a dog. Surprise, he said, was, not that the dog could dance so well, but that he could dance at all. Unwittingly and unintentionally others made for me a reputation that finally closed the pastorate against me. In more than one instance, when I reached a new place, I have found the people ready to lead me around because they thought I was totally blind. And in one case the pastor that preceded me told the people as much.

If I were a pastor again, I should seek with an earnestness that did not characterize my ministry when in the regular work, to help Christians solve one of the real problems of the religious life. This problem is, How shall secular work be done without becoming thoroly secularized? It has seemed to me that the Church has not always had, or furnished the answer to this question. The saints of the olden days were men and women who abjured worldly interests. The man or woman who would live a holy life must go into a cloister. Monasticism was the refuge of those who believed that every worldly pursuit is necessarily evil. This error survived the men and women who lived in cells and died in solitude. It has been a persistent and a prolific root of evils. In the Middle Ages it brought forth a harvest of idleness, profligacy and hidden crimes. In our times it produces hurtful misconceptions of the real purposes of life. Again and again men need the lesson that religious work may become secular and sinful, while secular work may become thoroly religious, and ought always to be so. The great question in the religious life is not what we do, but why. A

good motive cannot redeem a bad act, but a bad motive can vitiate a good act. Secular pursuits become sacred and holy when their motive is sacred and holy. All this is a mere truism, but truth never becomes so impaired in its vitality as when it becomes a truism. It is one of our moral misfortunes that we have a way of turning vital truths into truisms, any way. It cannot be that duties really conflict with each other. One may often be perplexed to know which duty is to take precedence, but this question can generally be settled by devout common sense. And every man who is conscious that he is in the line of duty has found the way, which, if faithfully and prayerfully followed, will ultimately lead him into the way of life. It has seemed to me that the Church's attitude toward wealth has not been consistent, and consequently has not helped earnest men to find the better way that traverses and embraces every obligation of life. From the pulpit men are told again and again, what is true—that the mere getting of money is a waste of life. And yet the pressure brought to bear upon all that it can reach and by methods that are not unquestionable, to raise money, not merely to meet its needful expenses, but to gratify its pride, raise questions in the minds of good men as to the honesty and consistency of the Church. It transpired a few years since that the "tainted money" against which such a protest was made had been persistently solicited by a high official of the very Church one of whose ministers raised a hue and cry that were heard all over the land. When the Church is laid at the gate of rich men to be fed from the crumbs that fall from their tables, those who laid her there need not be surprised if the dogs, instead of licking her sores, devour her bodily.

Were I pastor again, I should dwell more than I did in the other days on the privileges of Christians. The ethical side of the Christian life needs to be emphasized, of course. Men need to be told over and over again what they ought to do and what they must do in order to be Christians. But sublime a word as duty is, it is also a hard word. It rouses men's resentment when urged as the highest motive for Christian living. The best duties we discharge are not discharged from a sense of duty at all. Prayer, thanksgiving, faith, hope, love—who thinks of these as Christian duties? And yet, what would the Christian life be without them? If one's ideals and aspirations give character to his life, then the Christian ought to be the highest type of humanity, and is, if he but realizes his high calling, its character, its inspirations, its hopes for earth and Heaven. And I am sure that many good men and women are discouraged to the very edge of despair. They have set high ideals for themselves. Their faith has accepted large possibilities in the matter of holy living. Their hopes, in the best hours of life, when Heaven and earth seem near each other, have flown to the very gates of the Celestial City. But in other and less exalted hours these good men and women have found that they were largely flesh and blood, that their faith faltered in the crisis when it was needed most, and that their Christian character was alarmingly weak where they supposed it was strong. Then it is that the joy of religion flees out of their hearts and hopelessness takes its place. And in many cases this latter state becomes the habit of thought and feeling. Then it is that the pastor needs to come to these discouraged ones with the Gospel of good cheer.

I have always felt that one of the dangers of the ministry is professionalism. And I realize this more than ever now, and should seek more earnestly than ever to escape this peril if I were in the pastorate once more. A preacher needs to take his work seriously. He should seek to magnify his office; he should never seek to make his office magnify himself. He need not remind others that he is a preacher; he needs to remind himself that he is one. He should accept what-

ever comes to him in the way of social and business favors, not as personal compliments, but as tributes to his work. Often, because of such favors, he is tempted to selfishness and ingratitude—to take things just for granted, and so foster in himself and his family the beggar and pauper spirit. In his relations to men of business and with his people in their homes, he should not rely upon the respect that men have for the cloth; he should give them satisfactory evidence that he is a real, honest man as well as a preacher. Nothing counts for so much in the work of the ministry as downright sincerity. Nothing else can take the place of this. Without this, and even with it, clerical airs, clerical garbs, clerical tones and clerical pretensions bring the preacher into contempt. Naturally and properly men despise shams, and no sham more than a sham preacher. Whatever be the cause—mental or spiritual telepathy, or what not — a preacher will not excite more interest and more faith in others than he has himself. Half-hearted preaching leads to half-hearted hearing. Men have been deceived by hypocrites in the pulpit, but one thing has always been true: men's faith in the gospel is measured by their faith in the preacher that preaches the Gospel to them. Training in theological seminaries is not to be despised; knowledge is worth while, and careful study ought never to be dispensed with; but no one of these nor all of them combined can take the place of earnest sincerity in the preacher. "I believed, therefore have I spoken," said one of old; this must be true of every preacher who would lead men to the better way. It is permitted to men of all occupations to follow their callings for money considerations. The preacher enjoys no such privilege, and should not. Righteous money getting for righteous ends is right in the eyes of God and men. Preaching the Gospel is the *ne plus ultra* of human callings in honor and holiness; to make of it a means of money getting is sacrilege. Whatever be the rights of the ministry in the matter of compensation—and they assuredly have their rights in the premises—every pastor should know, and never forget it, that either the preacher or the Gospel must suffer. A high salaried ministry has never been a spiritual ministry. This reason is obvious.

Could I but take my place in the pastorate once more, I should put more stress than I have ever done in all my ministry upon the spiritual verities of the Gospel. It is not enough to say that Christianity is supernatural. That might be saying much or little according to what is meant by supernatural. The line between the natural and the supernatural is a hair line, and changes with every generation. True faith does not confine itself to either side of this ever shifting boundary. Its realm is on both sides of it. It does not believe less because it knows more. Knowledge enlarges its vision. Sensible of the material, it believes in the immaterial and the spiritual and the Divine.

I do not know; I would not dogmatize; but it seems to me that the rationalism that has found its way into the pulpit these latter days has filtered down thru the Church, carrying with it germs of doubt that have proven hurtful to the spiritual life of the Church. Anyway, I know this: a great change has come to the Methodist Church since I entered the pastorate thirty-five years ago. Conversions such as were the rule then, are the exceptions now. A pastor in those days must know how to deal with a soul in the agonies of conviction for sin and the bitter pangs of repentance. He must know how to pray and sing and exhort and wait. I have seen services that could not be dismissed. I remember one camp meeting service which lasted continuously from three o'clock in the afternoon till three o'clock next morning. Every phase of the experience of twice-born men and women was illustrated during that memorable twelve hours. It is more than twenty-

five years since then, but I can still hear the songs and shouts and prayers and groans and rejoicings of that glorious night at that old camp ground. The world did not scoff at such demonstrations then as much as some in the Church do today. Modern respectability, in the pulpit and out of it, ridicules or denounces such things, or at most admits that they were needful for other days and other people, but that we have, forsooth, grown too refined for such manifestations of interest in our souls and the souls of others. We have shortened and straightened and macadamized the way into the Kingdom so that one may travel easily and comfortably and with positive pleasure over it, and carry pretty much what he pleases and entertain no fear of inquisitive and impertinent revenue inspectors. Meanwhile poor human nature is the same, honest souls are conscious that they cannot by reasoning nor by an effort of the will bring themselves to love God, nor persuade themselves that they have not sinned, nor repress a longing for a sense of pardon. There are two fundamental facts in the Gospel. They are as old as Christianity and as enduring as the race of men on the earth. One of these is, Man is a sinner; the other is, Man has a Saviour. To dwell altogether on either one of these is to preach but half a Gospel. To preach the latter without the former is folly. To preach the former without the latter is cruelty. To tell a blind man that he ought to see would be unkind. To tell a deaf man that he ought to hear would be mockery. To tell a paralytic that he ought to walk would add to his wretchedness. To call to the dead to rise from their graves would be ghostly, ghastly ridicule. To tell men and women who know nothing of the regenerate life that they should be holy, is but to offer them a stone instead of the bread of life. What this world needs is not moral hygiene, but life from the dead.

But I am not a pastor now, and perhaps never shall be again. If this suggests a faint hope that one day the pastorate may be mine once more for a few short years, be it so. I have had my May. Now let me be content with my October. Some of the days are overcast, but most of them are bright poems of sunshine and soft skies, set to the gentle melody of autumn winds. The leaves fade into brown and yellow and red, but I know that there will be another May and green foliage after a while. The roses in the yard wither and drop, but there will be new, fresh roses next summer. The nights grow long and the days short, but the days will be long again next year. My friends die; several of my dearest companions in the ministry have gone over this year. But they lived and died in faith, and I expect to see them again. The shade upon my own life-dial has gone far down, and no Hezekiah's prayer will bring it back again. But I believe in Him Who is the Resurrection and the Life.

Understood

By Harold Lee King

Thank God for that one man
Who did not turn his head,
Who saw each bird and tree
But, seeing my infirmity,
Seemed not to see;
My weakness pitying
His pity to himself could keep;
Or sometimes when I sinned
Trusting that I without advice would
weep—
Left me to judge myself.

Freiburg, Germany.

Choosing Rhodes Scholars

The Purpose of the Founder and the Principles Which Should Govern the Choice of America's Delegates to the English University

By C. F. Tucker Brooke

[The writer, a graduate of the University of West Virginia, spent four years in Oxford, first as a Rhodes scholar, a member of St. John's College, then, after receiving the Degree of Bachelor of Letters, as Senior Demy of Magdalen College, and in research work of his own. He is the author of an authoritative history of *Tudor Drama*, and is assistant professor of English literature in Yale College.—EDITOR.]

Public attention, which at different times during the last ten years has made itself somewhat free with the subject, will doubtless be again attracted by the publication of Dr. Parkin's charming book on the Rhodes scholarships.* Appearing, as it does, at the close of the first decade of operation of the scholarship scheme, and just as the various committees of selection in the United States are busied with the choice of the seventh set of American scholars, the volume has a timely interest; and it has a very special value also as expressing the matured opinions of the two men who have most earnestly devoted themselves to the success of the enterprise.

Dr. Parkin, the organizing secretary of the Rhodes Trust, and Mr. F. J. Wylie, the Oxford secretary—who contributes two admirable chapters on academic and social conditions at Oxford—have endured, with a tact and patience which cannot be too gratefully appreciated, not only an infinitude of exacting labor, but also no small amount of trial at the hands of ill-informed and hasty critics. The volume in which they have collaborated comprises not merely a delightfully readable exposition of the ideals and opportunities involved in the scholarship plan of Rhodes; it contains as well a frank, tho eminently good-tempered and non-accusatory presentation of the responsibilities incurred by the beneficiaries of the trust and by the committees that select them as representatives of the different States or colonies.

**The Rhodes Scholarships*, By George R. Parkin, C.M.G., etc. Boston: Houghton-Mifflin Co. $2.

The annual report of the Rhodes Trust, just publisht, forms an interesting supplement to Dr. Parkin's book. It shows that, of the scholars who have left Oxford during the last six years, one hundred and twenty-three are now engaged in educational work; eighty-four in the practice of law; thirty-three in civil, diplomatic or consular service; twenty in religious ministry; fifteen in the medical professions; fourteen in business; eight in engineering; and five each in journalism, agriculture and forestry. These figures apply to the entire body of scholars, but statistics relating to the American contingent alone would show no essential difference in the relative appeal of the more popular vocations. Few persons acquainted with the facts will be inclined to dispute the conclusions reacht by the London *Times* in its discussion of the Trust report. Admitting that in the competition for university honors the Rhodes scholars have made a fair but not a remarkable record, the *Times* finds ground for satisfaction in the evidence that the returning scholars tend to elect in their own countries those educational, legal and civil employments which, under American and colonial conditions, offer the surest path to the public influence desired by Rhodes.

In view of the present-day emergence of the educator in politics, and the time-honored American association between law and public life, one may doubtless agree that the scholars seem to be placing themselves advantageously for the attainment of Rhodes's scheme of international amity. There remains unanswered,

however, the much more fundamental question whether the individual scholars are for the most part men of intrinsic abilities sufficient to make any large use of their opportunities.

Since the difficulties of selecting the scholars most likely to advance their own interests and to promote the legitimate aims of the founder by three years' residence at Oxford are by general admission vastly more complex in the United States than in the British Colonies or in Germany, it seems permissible to discuss certain specially American aspects of the problem. In doing so, tho speaking with no other authority than one man's personal experience as a Rhodes scholar, I shall doubtless be elaborating on the general truths so clearly stated by Dr. Parkin and Mr. Wylie.

Protest may very fairly be entered at the outset against the tendency to judge the satisfactoriness of a scholar's selection entirely on the basis of the honors which he gains at Oxford. This is emphatically a case where it is necessary for the critic to look rather to the end of life than to its beginning. Moreover, it would perhaps be surprising to find that anyone who has had opportunity to know well the mass of the American Rhodes scholars during their stay at Oxford should be inclined to think of them as, in the average, really disappointing. Certainly, one who has spent three years and more among them as one of themselves is likely to value the companionships thus enjoyed among his most permanently stimulating experiences; and the particular individuals whose personalities have left the most lasting and beneficial impress are not invariably those whose names are writ highest on the honors' list. Under the conditions of Oxford life it is likely to happen more frequently probably than in other environments that the man who really wishes to possess his own soul must here and there be willing to forego titular success. To the stock examples of Rhodes himself and Shelley dozens hardly less notable might be added.

The truth involved in what has just been said can never safely be lost to sight. Yet there is even more essential truth on the other side. The Oxford test, tho, like any other long and searching ordeal, it cannot be applied indiscriminately to every variety of human intellect, is nevertheless a high and worthy test, in which the rewards of success—where success necessitates no surrender of individuality—are quite as well worth attaining as most other rewards of mental endeavor. Unquestionably, it is better in every view that the United States send as their representatives men qualified by temperament and previous training to succeed along the lines of Oxford academic ambition, rather than men, perhaps equally highly endowed by nature, for whom this particular success may be possible, if at all, only at the hard price of suppressing their natural tastes and forcing their talents into the performance of unsympathetic tasks. So, again, the States would seem to owe it as a return for the very cordial hospitality shown by the Oxford colleges to their appointees to select as far as possible men likely to acquit themselves creditably under the regulations of the particular Oxford system —men, that is, comparable not only in degree, but also in kind of mental and social cultivation with those whom the Oxford colleges elect to scholarships on their private foundations.

This would seem almost axiomatic; but the fact is that a complete misunderstanding has been current in America regarding the type of man most likely to succeed as a scholar at Oxford and most likely to profit fully by his experience there. The clause in Rhodes's will, suggesting that choice should hinge not exclusively upon one single kind of qualification—a clause drawn up in entire ignorance of American conditions—has been generally interpreted to disqualify the specialist, whether in scholarship or athletics. The type of man who has normally presented himself as a candidate for the scholarship, and who has normally been selected, has been,

therefore, the man who combines a certain proficiency in lawn tennis or in some branch of track athletics with a fair stand in his classes and a pleasing personality. The numerous scholars of this type have undoubtedly made an agreeable impression at Oxford. They have done much to promote good fellowship between English and Americans, and in their future activities will doubtless do yet more. But this type of scholar has in general found himself totally unfitted for the severe struggle of the Oxford final honor schools.

The fault lies probably not so much with the scholar himself or with the committee which selected him as with the widespread American notion that an Oxford residence is desirable rather for the devotee of "broad culture" than for the specialist, and that the Rhodes scholarships are intended primarily for men of the former type. Thus it has often happened that the scholarships have been sought only by men who have reached the end of their American college career with minds so unsettled that they have been glad to postpone final issues and embrace the prospect of three pleasant fallow years. The specialist, who has already found his pace and fixt his ambitions, has felt himself discouraged from applying and has generally held aloof.

No one well acquainted with conditions in the Oxford final schools can fail to see how unfortunate this impression is. The truth is that the highest Oxford honors can be attained only by specialization and competition of the fiercest kind, and the average American college graduate finds himself at a distinct disadvantage in these respects beside the average English candidate for honors. We need not admit that the best American college course is inferior in actual educational value to the preparation provided in the best English public schools, but it is certainly true that the latter is considerably more homogeneous and more easily adapted to the service of the student who specializes at Oxford in such studies as the humanities or modern history or English literature. Moreover, many Rhodes scholars attempt the degree at the end of two years; all must take it within three; whereas the average English honors man allows himself four. The earlier half of the four years' course affords the conscientious student a drill in concentration and independent work—a training in the regarding of study from the point of view of the department or "Fach" rather than mere miscellaneous interest—which the average American is not likely to have till he has spent a year in a good graduate school.

It is not hard to see that, on the principles which have hitherto largely governed the application and selection of candidates in the United States, a very great proportion of the American scholars have found themselves seriously handicapped in the competition for Oxford academic honors. That the list of successes is as large as it happens to be is due in great measure, of course, to the presence of the not quite universally discouraged specialist. In not a few cases, however, it is a tribute to the adaptability and grit of the commonplace collegian, who, after a heterogeneous and unscintillating undergraduate career, sets out happily for Oxford with vague anticipations of a triennium made up of travel, reverie, and social intercourse. It is a fine thing that such men have once in a while responded surprisingly to the high expectations entertained of them by their Oxford colleges and tutors, have renounced all their projected pleasures, and by sheer drudgery made up their great initial disadvantage. Yet it is surely unfair to expect that any large percentage of the scholars will ever win distinction in a competition where the odds are so much against them; and it is almost certain that the rare men who may thus distinguish themselves in spite of crushing inferiority of preparation will have neither time nor heart for much that is of most positive value in the Oxford life.

If the American Rhodes scholars are, in the average, to hold a worthy

place in the intellectual life of Oxford, it will be necessary to attract into the competition for scholarships students qualified to enter at once upon an independent and specialized line of study. The high age limit of twenty-five easily permits the choice of men who have had a year in a graduate or professional school, or who have had other opportunity, after graduation, to find themselves and determine upon a definite career. Such men, other things being equal, will make the best representatives. Let it not be feared that they will be too little impressionable. No man under thirty, living for three years the regular life of an Oxford college, could escape its influence if he would. The danger lies quite in the opposite quarter. A stranger requires a clear head and a strong purpose to steer a straight course amid the bewildering cross currents of the Oxford "atmosphere." Honest and aspiring narrow-mindedness there inevitably finds its cure, whereas aimlessness drifts often into constitutional irresolution and permanent incompetence.

Disband!

By Percy Adams Hutchison

"It is proposed to disband the negro regiments."—*News item.*

Muster him out! He can ride a horse
Like an Arab fiend where the desert burns:
But his hide is black, his hair is coarse:
So muster him out.—He can ride a horse?
(But a nation lives and learns.)

Muster him out! His work is done!
Never again shall his captains call—
Higginson, Shaw: the fort is won:
No more with blood shall the rampart run:
(One flag floats over all.)

Muster him out! The grasses wave
On San Juan slopes; the living hell
He charged, is still: the grasses wave:
The sun beats down on grave by grave;
(And others had fought as well.)

Muster him out! Abe Lincoln's dead!
Higginson! Shaw! these are modern days!
Muster him out, tho his fathers bled
At his country's need—(Thank God the dead
See not how a nation pays.)

New York City.

WELL SAID

NOTABLE PARAGRAPHS FROM THE NEW BOOKS

The Repression of a People's Vital Energies

What this country needs above everything else is a body of laws which will look after the men who are on the make rather than the men who are already made. Because the men who are already made are not going to live indefinitely, and they are not always kind enough to leave sons as able and as honest as they are.

The originative part of America, the part of America that makes new enterprises, the part into which the ambitious and gifted workingman makes his way up, the class that saves, that plans, that organizes, that presently spreads its enterprises until they have a national scope and character—that middle class is being more and more squeezed out by the processes which we have been taught to call processes of prosperity. Its members are sharing prosperity, no doubt; but what alarms me is that they are not *originating* prosperity. No country can afford to have its prosperity originated by a small controlling class. The treasury of America does not lie in the brains of the small body of men now in control of the great enterprises that have been concentrated under the direction of a very small number of persons. The treasury of America lies in those ambitions, those energies, that cannot be restricted to a special favored class. It depends upon the inventions of unknown men, upon the originations of unknown men, upon the ambitions of unknown men. Every country is renewed out of the ranks of the unknown, not out of the ranks of those already famous and powerful and in control.

There has come over the land that un-American set of conditions which enables a small number of men who control the government to get favors from the government; by those favors to exclude their fellows from equal business opportunity; by those favors to extend a network of control that will presently dominate every industry in the country, and so make men forget the ancient time when America lay in every hamlet, when America was to be seen in every fair valley, when America displayed her great forces on the broad prairies, ran her fine fires of enterprise up over the mountain sides and down into the bowels of the earth, and eager men were everywhere captains of industry, not employees; not looking to a distant city to find out what they might do, but looking about among their neighbors, finding credit according to their character, not according to their connections; finding credit in proportion to what was known to be in them and behind them, not in proportion to the securities they held that were approved where they were not known. In order to start an enterprise now you have to be authenticated, in a perfectly impersonal way, not according to yourself, but according to what you own that somebody else approves of your owning. You cannot begin such an enterprise as those that have made America until you are so authenticated, until you have succeeded in obtaining the good-will of large allied capitalists. Is that freedom? That is dependence, not freedom.—[From *The New Freedom*, by Woodrow Wilson, (Doubleday, Page), p. 17.]

Hauptmann's Literary Development

Hauptmann's career began in the years when the natural sciences, not content with their proper triumphs, threatened to engulf art, philosophy and religion; in the years when a keen and tender social consciousness, brooding over the temporal welfare of man, lost sight of his eternal good. And so Hauptmann begins by illustrating the laws of heredity and pleading, thru a creative medium, for social justice. The tacit assumptions of these early plays are stringently positivistic; body and soul are the obverse and reverse of a single substance; earth is the boundary of man's hopes.

With *The Assumption of Hannele* a change comes over the spirit of his work. A thin, faint voice vibrates in that play—the voice of a soul yearning for a warmer ideal. But the rigorous teachers of Hauptmann's youth had graven their influence upon him, and the new faith announced by Heinrich in *The Sunken Bell* is still a kind of scientific paganism. In *Michael Kramer* (1900), however, he has definitely conquered the positivistic denial of the overwhelming reality of the ultimate problems. For it is after some solution of these that

the great heart of Kramer cries out. In *Henry of Aue* the universe, no longer a harsh and monstrous mechanism, irradiates the human soul with the spirit of its own divinity. These utterances are, to be sure, dramatic and objective. But the author chooses his subject, determines the spirit of its treatment and thus speaks unmistakably. . . .

Thus Hauptmann's work has not only created a new technique of the drama; it has not only added unforgettable figures to the world of the imagination; it has also mirrored and interpreted the intellectual history of its time. His art sums up an epoch—an epoch full of knowledge and the restraints of knowledge, still prone, so often, before the mechanical in life and thought; but thruout all its immedicable scepticism full of strange yearnings and visited by flickering dreams; and even in its darkest years and days still stretching out hands in love of a farther shore. Once more the great artist, his vision fixt primarily upon his art, has most powerfully interpreted man to his own mind.—[From Ludwig Lewisohn's introduction to the first volume of *The Dramatic Works of Gerhart Hauptmann* (Huebsch), p. 35.]

Winter in New York

Low leaden clouds beyond which the eye cannot trace the disk of the sun. Whirling, twisting, redounding winds that sting the cheek as freezing water bites the hand. The mud of the streets solidified as rock. Roofs, verandas, fences, doorsteps; the poles of the telegraph, the posts of gas light and of electric light—all ice-cased, snow-thatched. Along the city's great avenue by night palaces buried deep in warmth with frosted window-panes; thru curtains of damask and of lace dim moonlike radiance glimmers. Waiting chauffeurs with flapping arms buried deep in their furs like Esquimaux. The wide river alongside the city with rhythmic ebb and flow between the sweet tide of the mountains and the salt tide of the sea now quieted under the rigor of the frost, each bank far out to mid-stream covered with the fixed ermine and silver of the frost. In the narrow mid-channel the grinding and crushing of loosened blocks of ice by the careful ferryboats as they barely force their way to the gray-bearded piers. Out on the ocean great mystical steamers coming into port as if bringing tidings from the Ice Age of the earth; their masts and decks spectral with the death of the North, their ice-plated prows tossing aside waters as white as breast feathers of Arctic swans. In the park under a sky where the sharp-rimmed moon rides full and thick stars glisten in diamond ether, all nature snow-hung; nights as still, brilliant, dead as those on Lapland wastes. [From *The Heroine in Bronze*, by James Lane Allen (Macmillan), p. 224].

General Booth Enters into Heaven

[TO BE SUNG TO THE TUNE OF "THE BLOOD OF THE LAMB," WITH INDICATED INSTRUMENTS.]

Booth led boldly with his big bass drum.
Are you washed in the blood of the Lamb?
The saints smiled gravely, and they said, "He's come."
Are you washed in the blood of the Lamb?

[BASS DRUMS.

Walking lepers followed, rank on rank,
Lurching bravos from the ditches dank,
Drabs from the alleyways and drug-fiends pale—
Minds still passion-ridden, soul-powers frail!
Vermin-eaten saints with moldy breath.
Unwashed legions with the ways of death—
Are you washed in the blood of the Lamb?

Every slum had sent its half-a-score
The round world over—Booth had groaned for more.
Every banner that the wide world flies
Bloomed with glory and transcendent dyes.
Big-voiced lassies made their banjos bang!
Tranced, fanatical, they shrieked and sang,
Are you washed in the blood of the Lamb?

[BANJO.

Hallelujah! It was queer to see
Bull-necked convicts with that land make free!
Loons with bazoos blowing blare, blare, blare—
On, on, upward thru the golden air.
Are you washed in the blood of the Lamb?

[BASS DRUMS SLOWER AND SOFTER.

Booth died blind, and still by faith he trod,
Eyes still dazzled by the ways of God.
Booth led boldly and he looked the chief:
Eagle countenance in sharp relief,
Beard a-flying, air of high command
Unabated in that holy land.

[FLUTES.

Jesus came from out the Court-House door,
Stretched his hands above the passing poor.
Booth saw not, but led his queer ones there
Round and round the mighty Court-House square.
Yet in an instant all that blear review
Marched on spotless, clad in raiment new.
The lame were straightened, withered limbs uncurled
And blind eyes opened on a new sweet world.

[BASS DRUMS LOUDER AND FASTER.

Drabs and vixens in a flash made whole!
Gone was the weasel-head, the snout, the jowl;
Sages and sibyls now, and athletes clean,
Rulers of empires, and of forests green!

[GRAND CHORUS—TAMBOURINES—ALL INSTRUMENTS IN FULL BLAST.

The hosts were sandaled and their wings were fire—
Are you washed in the blood of the Lamb?
But their noise played havoc with the angel-choir.
Are you washed in the blood of the Lamb?
Oh, shout Salvation! it was good to see
Kings and princes by the Lamb set free.
The banjos rattled, and the tambourines
Jing-jing-jingled in the hands of queens!

[REVERENTLY SUNG—NO INSTRUMENTS.

And when Booth halted by the curb for prayer
He saw his Master thru the flag-filled air.
Christ came gently with a robe and crown
For Booth the soldier while the throng knelt down.
He saw King Jesus—they were face to face,
And he knelt a-weeping in that holy place.
Are you washed in the blood of the Lamb?

[By Nicholas Vachel Lindsay, in January issue of *Poetry*.]

Origines Golfianae

(From a manuscript of uncertain antiquity.)

IV. DE GLOBULO ADEUNDO.[1]

The Addressing of the Ball.

Et globulum et adversarium et cadiferum comiter, si potest, comiter adi. Sed interdum accidat ut globulus impie, cadifer copiose, adversarius nihil adeundi sint.

In as far as it lieth in thy power, address the ball gently as an ally and not as an adversary. But if thy peace of mind require the getting of strong words out of thy system,[2] it is best to express thine objurgations in Greek; thus may thy cadifer acquire a new language without effort.[3]

Sed, si cum socerdote templi ludis, voces circumscribite verbis: "O tempora!" vel "Quid vero!"[4] ne aures viri sancti offendantur.

VI. DE OCULO FIGENDO IN CAVUM.

On keeping the Eye on the Hole.[5]

Ut tuum ludum, globulator carissime, magni aestimas, cum virgam ad brevem putationen faciendam[6] sumis, oculum, mihi crede, in cavum fige.[7] Complura certamina amissa sunt quod blobulator oculum in globulum quam cavum figere maluit.

[1]"On the Addressing of the Ball." "Adeo" means both to address a person and to settle one's self to a task. The latter is the modern sense of the term: the classic golfer employed the word only in its former significance.

[2]"Ut impia verba e pectore expellas."

[3]This precaution for the cadifer's welfare is in marked contrast with the provision for his punishment in the case of the lost ball.

[4]"Well! Well!" and "Shocking!"

[5]This is contrary to the fundamental principles of the modern game. And yet, would not some of us, who are obsessed by the uncontrollable impulse to shift the gaze at the critical instant, be better putters if we would cease to attempt the impossible and, harking back to first principles, frankly "keep the eye" on the cup?

[6]"To make a short putt." See Etymology for the derivation of "putt." The origin of the word, and the intimate relationship of the stroke to the downfall of Caprilius may well point to a beginning of sinister inspiration.

[7]"By all means, keep your eye on the hole."

[From *The True Origin of Golf*, by Arthur V. Taylor (The Elm Tree Press, Woodstock, Vt.), p. 41.]

The Atom and the Ether

Fifty years ago we knew that such a thing as an atom existed, but we knew absolutely nothing about its structure, and it was customary to assume that it had none. Today we know a great deal about the structure of the atom, but the position formerly occupied by it has been assumed by that thing which we call the ether. We know that there is a vehicle for the transmission of electromagnetic energy, but we know nothing whatever about its structure and it has been customary to assume that it has none. To deny the existence of this vehicle, which we have been in the habit of calling the ether, and to use the word "vacuum" to denote *all* the properties heretofore assigned to it by the experimentalist, viz., those of transmitting electromagnetic disturbances, is a bit of sophistry in which he is little interested. We seem to be on the eve of learning something more about the properties of this vehicle, call it by what name you will, than we have known heretofore. Certainly there has never been a time when physics offered such tasks to its followers as now, nor ever a time when it needed more and better brains applied to these tasks.—[From "Atomic Theories of Radiation," by Prof. R. A. Millikan, *Science*, January 24, 1913.]

War Correspondents Entertained by a Futurist

I think we were now so utterly miserable that a reaction set in. It was necessary to summon up a little gaiety to relieve this intolerable situation. It was provided by Signor Marinetti, the master Futurist, a man whose fantastic philosophy I have often attacked in the public press, but a man who in private life has an inexhaustible vivacity and fund of high spirits, a keen sense of humor, and a most daring eloquence. There was one lady in the carriage with us, a Bulgarian lady of some beauty. Marinetti found no difficulty in getting into conversation with her, and with a little wizened fellow in her company, who was a master of mathematics. In Italian, of which she understood no word, he praised her beauty, spoke passionately of the philosophy of love, divided the philosophy of life into terms of poetry and mathematics, and denounced all mathematical masters as men of hard nature and unimaginative souls. The lady was fascinated and mesmerized by Marinetti's speech, and he then sang little songs to her, and in spite of the cramped and crowded carriage danced little dances to her, in the Italian, Arabic, Persian and Futurist styles.

Finally he was prevailed upon to recite his great poem, *L'Automobile*. Before doing so he begged me to open both the windows, so that he might have fresh air, and took off his coat so that he might have free play for his eloquence. Then he began his recitation, in which he describes the beauty, the joy, the exultation, the swift ecstasy of the soul of the automobile as it rushes over mountains and down the valleys and along the high roads singing the song of speed. It is a thing of genius, and Marinetti, the composer of it, threw his whole heart and soul into it, until the veins stood out on his

forehead, and his face was scarlet and his voice rang out like a trumpet. The sound of his far-carrying voice startled the people in the neighborhood of the train. Hairy savages with naked bayonets came rushing up. Peasants crowded about with gaping mouths and wondering eyes. The first recitation of the master Futurist in Novi Zagora was an immense success.—[From *The Balkan War,* by Philip Gibbs and Bernard Grant (Small, Maynard) p. 126.]

One Welshman

I am here to ask you to include among Welsh contributions to the larger movements of the world the name and world-wide fame of Thomas Jefferson, author of the Declaration of Independence.

Do I need reason for this beyond his unchallenged Welsh origin? Who will name the achievement by any other man of Welsh blood or of British blood which has more largely influenced the world for good than that empire-shaking, continent-shaking document, that saved Great Britain from herself; that saved America *for* herself, and developed in place of a two and a half millions of that day a nation of ninety-three millions on the continent, while it protects and guides islands of ten or twelve millions more in every zone and on every sea; that shook down the most obstinate of monarchies, turned it into a republic, with a regenerated people, now the most prosperous government France ever had, and the most stable and enduring it ever had since Louis XIV—not excepting that of either Napoleon.

Yet these are merely some of the external results more or less distinctly traceable to the momentous statement he addressed to the civilized world on the Fourth of July, 1776. I do not dwell upon any of them or argue them. Still less do I insist upon the English style, lucid, convincing, and of a stately dignity (unsurpassed, I venture to think, by any official paper in your thousand years of parliamentary history), in which he clothed one of the most philosophic and unassailable and yet most revolutionary accounts of the origin of government since Plato:

> We hold these truths to be self-evident, that all men are endowed by their Creator with certain inalienable rights, that among these are life, liberty and the pursuit of happiness; that to secure these rights governments are instituted among men, deriving their just powers from the consent of the governed.

[From *One Welshman,* A Glance at a Great Career. Inaugural Address, University College of Wales, Aberystwyth, October 31, 1912, by Whitelaw Reid (Macmillan), p. 11.]

The Artist's World

The artist loves the world, not because it is moral or immoral, not because it is always even beautiful, but because it is his world, our world, a world sometimes good and sometimes bad, sometimes happy and sometimes sad, sometimes sane and sometimes mad, but the world of the facts that God made and allowed, the world of the facts which art can transmute into a mystic source of happiness to all people with seeing eyes and responsive hearts.—[From *The Artist's World,* by Stockton Axson (Scribner), p. 41.]

Three Stages of Progress

In former descriptions of progress, I divided it into two parts, a pain economy, in which fear and suffering drive man to his daily tasks, and a pleasure economy, in which the motive of action is the pleasure derived from the goods enjoyed. I now regard this division as defective. To love pleasure is a higher manifestation of life than to fear pain; but the pleasure of action is in advance of the pleasure of consumption.

Action creates what pleasure uses up. This would divide progress into three stages: a pain economy, a pleasure economy, and a creative economy. Each stage has its own mode of thought, and its own social institutions. To visualize the elements of these stages, I have put them in the following table:

Stage of Progress	Form of Struggle	Form of Control	Character of the Social Bonds
1. A pain economy	Race struggle	Ancestral control	Blood bonds
2. A pleasure economy	Class struggle	Wealth control	Interest bonds
3. A creative economy	Self direction	Character control	Social beliefs
Type of Thought	**Thought Limitations**	**Kind of Philosophy**	**Type of Morality**
1. Theological	Substance	Anthropomorphic	Traditional
2. Rational	Space	Material	Utilitarian
3. Pragmatic	Time	Ideal	Telic

[From Prof. Simon N. Patten's "The Reconstruction of Economic Theory" in the *Annals of the American Academy of Political and Social Science,* November, 1912.]

THE NEW BOOKS

Civil War Books

There is nothing of absorbing interest in the recent contributions to the history of the Civil War, tho several of the numbers are excellent both in substance and manner. Perhaps Mr. Beymer's collection of tales about the secret service men and women will be more widely read than any of the others.

Personal Recollections of the War of the Rebellion,[1] is a collection of addresses delivered before the New York Commandery of the Loyal Legion. There are twenty-one of these addresses, and their range is wide. Notable among them is General Edward H. Ripley's account of the surrender of Harper's Ferry and of the part played in that engagement by the Ninth Vermont. The salient causes of that needless sacrifice of 12,500 men are well brought out in the consideration of McClellan's hesitancy, Franklin's tardiness and the imbecility or drunkeness or treason of Miles. General Ripley also pays a devoted tribute to the conduct of Col. Stanard of the Ninth Vermont. Another interesting address is that by Major William F. Morse, on the Indian campaign in Minnesota in 1862. There are several papers on prison life and conditions. Major George Haven Putnam's address, which has been separately printed, has received earlier review. Lieutenant Sturgis's address on Prisoners of War, which is treated below, is also contained in this volume, and has also been separately printed. A defence of the Elmira Prison is contributed by Mr. Clay W. Holmes.

Lieutenant Sturgis's *Prisoners of War,*[2] is a record of personal experience and a study of the condition and treatment of both Confederate and Union prisoners. During a part of 1864 his regiment was stationed as a guard at Camp Morton, near Indianapolis. Later in the war, while serving with the Army of the Potomac, he was captured and was subsequently confined in Libby Prison. He thus had opportunities of studying the treatment and conditions of prisoners on both sides. His account of conditions in Camp Morton and his quotations from Confederate prisoners regarding other Northern prison camps shows a very different state of affairs from that which prevailed at Libby and Andersonville. He enters somewhat deeply into the whole question of the policy regarding prisoners of war as maintained by both the Northern and the Southern administrations, and quotes from many authorities to show the frightful conditions under which the Union prisoners suffered. In particular, his citation of testimony given by Confederate officers and surgeons during the trial of Wirz support and confirm his conclusions.

Mr. Gross's *Lincoln's Own Stories*[3] is a handy and valuable collection of stories by and about the Great Emancipator. Mr. Gross avers that he has been for many years collecting these stories, that he has carefully sifted the true from the false, and that he has assembled the best and the essential ones. Such a book is useful and may be popular. It would have been more valuable, however, if he had exercised somewhat more discretion in choice and if he had given the authority for each story. In spite of his care some of these stories are dubious. The one about the barrel of whiskey which Lincoln wanted to

send to each of his generals, and which is here printed without question, was disavowed by Lincoln himself, according to the testimony of Bates, one of Stanton's telegraphers. The alleged statement of Lincoln to Alexander Stephens that if he, Lincoln, could write the word "union," Stephens could write anything he pleased under it, is also printed without comment, altho its authenticity has aroused a good deal of controversy. Other stories, equally doubtful or controverted, are included.

General Schaff relates, in the manner of his well-known *Battle of the Wilderness*, the movements of the armies from Five Forks to Appomattox[4]. Like an eye-witness he pictures the relentless pursuit of the retreating Confederates by troops who, keeping ahead of their trains, are weakened by hunger and worn by rapid and long marches, but at the same time are buoyed up with the thought that a few more days of strained exertion will end the war. There is a good deal of sentiment—sometimes bordering on sentimentality—in Schaff's reminiscences; yet the sparkling flow of his narrative, the vividity of his description, his sympathetic portraiture of the officers of both armies, high and low, and the broad and kindly spirit in which everything is conceived and phrased, render the account most winning and admirable. We do not know where else is to be found so satisfying a pen-picture of that campaign.

The invaluable work of some of the noted scouts and spies in both Northern and Southern service is most entertainingly told by Mr. Beymer in his *On Hazardous Service*[5]. There is the tale of Elizabeth Van Lew, who thruout the war constantly communicated from her Richmond home to the Washington authorities, and of Mrs. Rose Greenhow, who during the early part of the war performed like service from Washington for the Confederates. There is the story of Timothy Webster, perhaps the most resourceful and efficient of all the secret service men of the North, who nevertheless was apprehended and hanged in Richmond—the first victim of the military law that decrees death to the spy. There is the tragic tale of dare-devil Wat Bowie, who courted danger for the fun there was in it; who rode and fought with Mosby and who threaded every by-path in Southern Maryland in the service of the Confederacy. Other narratives are those of John Y. and Charles Phillips of Richmond; of Colonel H. H. Young, Sheridan's chief of scouts, who passed safely thru incredible dangers to fall the victim of a mad adventure on the Mexican border after the war; of Archibald H. Rowand, Jr., one of Young's men; of John Landegon, some time with Sheridan and later with Kilpatrick, and of the mysterious Colonel W. Orton Williams, hanged as a Confederate spy June 9, 1863, at Franklin, Tenn. No work of fiction could possibly furnish so many thrills. The work is admirably done. The narratives are told as stories, but they are, in all the essentials, supported by personal testimony and by official documents.

General Early began the preparation of his volume[6] in Canada shortly after the war and continued to work upon it until his death in 1894. For some reason, unexplained, it has not been publisht until now. It is a full and even minute record of his services during the Civil War and of episodes and movements connected with his own activities. General Early had strong feelings and opinions, not to say prejudices, and he exprest them bluntly. The Creator, in his belief, had stamped the negro with indelible marks of inferiority (pp. ix-x), and reason, common sense and other considerations required that they "should be kept in a state of subordination." He had a very poor opinion of the Union generals, of whom McClellan seemed to him the least inefficient. There can be no

doubt, he writes, that McClellan "was the ablest commander the United States had in Virginia during the war by long odds." Sheridan seemed to him "without enterprise," and of "an excessive caution which amounted to timidity." His own escape from annihilation at Winchester (Opequon) he attributes to the "incapacity" of Sheridan. Of Grant, Meade, Burnside, Hooker and Hunter he also speaks slightingly. The work will not add anything to the reputation of Jubal Early.

Lieutenant Worsham[7] gives a record of his experiences thru the greater part of the war as a soldier in Company F, Twenty-first Virginia Infantry. His service took him into many of the great battles. At Cedar Creek he was wounded and invalided. It is the life of the soldier that he tells, and his book is full of incidents of the march, of battles and of camp life. The book will bear reading, tho it can hardly be called history, or, except in spots, the material out of which history is made. It is personal and partisan, and a fair sample of a type of Southern product which is too common. In all the books of this class one gets the invariable impression of enormous masses of Federals madly escaping from a thin line of pursuing Confederates. The latter are never defeated; rarely do they retreat, tho sometimes they "return." One wonders how, in the circumstances, there could ever have been an Antietam, a Gettysburg, a Pea Ridge, a Vicksburg, a Fort Donelson, a Nashville, a Winchester, a Cedar Creek, a Chattanooga, a march to Atlanta, to the sea and to Goldsboro, and, finally, an Appomattox. We wish that some of these reminiscences could be written in the spirit in which General E. P. Alexander wrote his admirable memoirs.

Mr. Damer, in his *When the Ku Klux Rode*,[8] tells in a somewhat disjointed way some of the incidents that occurred in a part of the Black Belt of Alabama during the Reconstruction period[8]. Scalawags, carpet baggers, negroes and Ku Kluxers are shifted back and forth across the stage, a good deal of commotion is pictured, and bloodshed is frequent. tho the tale is told without evident exaggeration, it is not an impartial account. All the fault and all the depravity are on one side, and all the heroism, rectitude and devotion on the other.

Dr. McKim's *The Numerical Strength of the Confederate Army* is a serious attempt to meet the criticisms made by General Charles Francis Adams, Colonel Thomas L. Livermore and others, of the common statement of Southern writers that the Confederate military strength all told was not more than 600,000 men. It is a small book, too brief to cover with sufficient detail all of the complex questions involved. Yet it deals with the subject concisely and with straightforwardness. Dr. McKim holds to the 600,000 estimate, tho he qualifies it to the extent of including only those who actually served in the field. He is not unwilling to admit a possible enrollment of 700,000. Dr. McKim's argument is based on the lack of arms and equipment; the loss of territory; the great number of exemptions from service; the opposition of State governments to the Conscript Law; the "disloyalty" of a part of the Southern population, and the necessity of maintaining thru the South an industrial army to supply the needs of the military force. We cannot say that he has successfully met the data and conclusions of Livermore and Adams. The argument is sometimes loose, and there is too frequently a dependence upon someone's personal opinion rather than upon a logical deduction from established evidence or probabilities. "Is it credible," he asks, "that the Adjutant General of the army (General Cooper) should have given as his opinion that this number — 600,000 — was nearly critically correct if in fact there had been upon the rolls of the Confederate armies twice that num-

ber?" The personal opinion of even the best of men in questions that have awakened the strongest passions is, it may be said, a wholly worthless guide. In such a matter only a passionless consideration of the available data has any value. Dr. McKim closes his little volume with a statement that at Appomattox Lee declared to Meade that he had had only 29,000 muskets along his entire front from Richmond to Petersburg, and that Meade replied: "Then we had five to your one." The story may be true, tho we are inclined to regard it as apocryphal. Five times 29,000 muskets would give for the Federal force 145,000 muskets, which with artillery, cavalry, officers of all kinds and miscellaneous armed men in all branches of the service ought to aggregate more than 200,000 men. It is enough to say that Livermore, basing his figures on the War Records, gives as the total Federal strength opposing Lee on March 29, 1865, 112,892, and as the Confederate strength 49,496. As 13,769 Confederates were captured from March 29 to April 7, 28,-231 were surrendered at Appomattox, about 7,200 escaped or deserted, and more than 6,000 were killed or wounded, the number of 29,000 must either be an error, or the infantry must have represented an unusually small proportion of the army as a whole.

Men and Religion Forward

Last year the Evangelical churches in the United States, and some auxiliary organizations, submitted the question of the relation of the Church, as an organized expression of religion, to the people. The Men and Religion Forward Movement, as it was called, was really much more in the nature of a test of the spirit and purposes of the Church, and a demonstration of its practical capacity, than a trial of the layman's disposition to coöperate in church work. This was defined early in the preliminaries, when there was a sharp struggle between progressives and conservatives relative to the inclusion of social service among the topics to be treated. That topic was included, and of the seven volumes making up the official report of the movement that treating of Social Service is vastly the most interesting, and we believe the most valuable (*Messages of the Men and Religion Movement*, New York: Association Press). Its manifest rival is the volume devoted to the Church and the Press. Other subjects are Congress Addresses, Bible Study and Evangelism, Christian Unity and Missions, Boys' Work, the Rural Church. The address on Civic Life opens with these brave words: "The artificial distinction between the sacred and the secular has been gradually fading out, leaving only a more clearly and firmly drawn line between the right and the wrong." We can easily believe that, and if the Church is coming to see it also, and bravely to publish its belief, then we are surely getting on—and up. Driving this confession grimly home, we have the brilliant five-page address of Prof. Walter C. Rauschenbusch upon The Conservation of the Social Service Message, which must have been gall to the ultra-conservatives, but manna to the progressives.

A New Conscience

Many deeply moral men and women no doubt feel justified in preserving a happy ignorance of the harrowing conditions which attend the maintenance of the social evil in this enlightened age, but the growing dangers to which those entirely innocent are subjected by its notorious physical and moral results are fast making it impossible for the most sensitive and reserved to avoid facing the facts and the accompanying responsibilities, ugly and unpleasant as these may appear. No one could have presented this subject in its various phases with greater force, moral fervor, and effectiveness than Miss Jane Addams (*A New Conscience and an Ancient Evil.* Macmillan, $1). Her long experience as a social settlement worker at Hull House, her connection with the Juvenile Protective Association of Chicago, and her active interest in special investigation into the moral and economic conditions and histories of children and youth who have fallen into the way of the transgressor, have given Miss Addams an extraordinary knowledge of the contributing causes and the hideous results of the life of shame. Yet these material facts of a degrading reality are handled in a way that arouses to the highest pitch the reader's social sympathy for the wronged and outcast, and his righteous indignation against the conditions of economic pressure, the fiendish wiles of the "white slave trader," and the stolid indifference of a half-informed, half-competent public conscience; which form the necessary back-

ground of the dark picture. But Miss Addams finds many hopeful signs of a new conscience in regard to this ancient and deep-seated evil. The general movement toward the betterment of social and economic conditions, the greater concern and sympathy of society as a whole, shown in more active philanthropic rescue and preventive work, the endeavor to enact more stringent laws and exercise more effective social control, are all symptoms of a rising sense of internal social danger and a consciousness of power to cope with the threatening evil. Most of all does Miss Addams rely upon education, mental and moral, for youth and maturity alike, to abolish this oldest and vilest plague-spot of civilization. One rises from reading her remarkable book with an appalling sense of the magnitude of the problem, but with renewed hope.

The New Freedom

Mr. Bryan, in *The Commoner,* publishes the letter which he has sent to Messrs. Doubleday, Page & Co., who issue President Wilson's book, *The New Freedom.* Mr. Bryan writes, in part:

> Anything coming from one just entering upon the responsible duties of the Presidency would be worth reading . . . and it is only fair to add that the value of the volume is still further enhanced by the style of the author—clear-cut, forcible, and abounding in apt illustrations. Those who would calculate with accuracy the course of the ship of state under the pilot who takes his place at the wheel on March 4 can find in *The New Freedom* a chart of the seas to be traversed during the next four years. Progressives will welcome the book as renewed evidence of the author's consecration to the great task of popularizing the Government.

President Wilson's subtitle for the volume is as follows: "A Call for the Emancipation of the Generous Energies of a People."

> As he explains in his preface, he did not write this book at all. "It is the result of the editorial literary skill of M. William Bayard Hule, who has put together here in their right sequences the more suggestive portions of my campaign speeches. . . . The book . . . is an attempt to express the new spirit of our politics."

These words are uttered in the same temper as those of the inaugural address, where the new President's emotion is neither triumph nor exaltation, but a sense of solemn responsibility. "Who shall live up to the great trust?" exclaims this new and unprecedented President. "Who dares fail to try? I summon all honest men, all patriotic, all forward-looking men, to my side. God helping me, I will not fail them, if they will but counsel and sustain me!"

A Gentle Jehu in Japan, by Ethel L. McLean (Dodd, Mead) is a gift-book of commonplace tourist letters and pretty colored illustrations.

From E. P. Dutton & Co., the importers, we receive a charming variety of Easter cards of all shapes and descriptions.

Literary Notes

Lord Tennyson, the son of the poet, writes to the London *Times,* apropos of the auctioning of another poet's correspondence:

> Cannot Robert Browning's nearest relatives stop this infamy of the sale of Browning's love letters? Mr. Browning was walking one day with me in Eaton Place. He said: "Tell your father I have destroyed 1,500 letters of mine to my father. He will rejoice, for he loathes as much as I do the casting of one's heart into the street as garbage to fools."

This last phrase has the vigorous ring of a genuine piece of Browning. But how glad we are that the auction sale of the poet's relics occurs in London! If, by any chance, it had taken place on this side of the ocean, the British reviews would have been full of fulminations against our jejune vulgarity.

The Constructive Quarterly is the name of a new candidate for the favor of the public. It has no parallel or rival. It is a religious quarterly, of the broadest scope, and the nearest parallel is *The Hibbert Journal,* that admirable and even popular monthly whose purpose it is to discuss from very diverse points of view the important questions of religion. *The Constructive Quarterly* may develop into such a magazine, but its chief purpose is to illustrate and develop the unity of faith within Christianity. It will try to do in the field of journalism what the proposed Episcopal Conference proposes, to find out what are the differences which keep Christians apart and to aid their fellowship. Accordingly, it welcomes to its pages Orthodox Greeks, Catholics and Protestants. In this first issue Archbishop Platon speaks for the Greek Church; and three for the Catholic Church, Georges Guyau for France, Wilfrid Ward for England, and the Jesuit Father Wynne for America. Protestantism is represented by Professors DuBose, Episcopal; Sanday, Anglican; Loofs, German Lutheran; B. W. Bacon, Congregational; Robert E. Speer, Presbyterian, and Bishop McConnell, Methodist. Of these articles that of Professor Loofs is distinctly theological, on "Faith Only," as is that of Bishop McConnell on "Conversion," while Mr. Speer gives us a valuation of Henry Clay Trumbull under the title of "An American Saint." The editor is Silas McBee, who for some ten years gave great vigor to *The Churchman,* and who then made an extended visit abroad in the interests of Church unity, the fruit of which will be seen, we hope, for years, in this excellent quarterly.

THE FUTURIST

Drawn by C. R. Weed.

THE COLONEL:—"You don't understand this new style of painting? Well, *this* one is clear as day!"

[Mr. Roosevelt spent part of inauguration day at the International Art Exhibition in the Sixty-ninth Regiment Armory.—*A New York Newspaper.*]

SURVEY of the WORLD

A Menace to Our Oak Woods

The experts who have been fighting the gipsy moth in New England have noted a decided lessening in the pest, and find it is due to "wilt," an infectious disease of the caterpillars similar to the flacherie of the silkworm, and propagated by a bacterium (*Gyrococcus flaccidifex*). This malady appeared, whence or how no one knows, about 1903, in eastern Massachusetts, by 1907 was extensively prevalent, and is still in progress. Simple possession of the disease is not fatal to a caterpillar under healthful conditions, but if the infected worm becomes weakened, as by poor food, it will sicken and die. In a surprisingly short time its body will disintegrate and be resolved into a black liquid containing myriads of the germs of the disease, which, dropping, will poison the foliage below. Another caterpillar feeding there of course takes in the germs, and so the disease spreads with amazing rapidity. Hence the omnivorous taste of this insect reacts to its destruction; and herein resides the secret not only of the diminution of the gipsy moth of late, but the most fruitful suggestion for further relief, namely, the elimination of the trees that furnish favorable food to the insect, and the cultivation of those bad for it. The poorer its food the more likely the creature is to "wilt" before it can do much harm.

Formerly it was thought that the worms thrived on every kind of vegetation alike, but it is now known that the leaves of some trees are better fare for it than those of others; and that only when it is consuming those of the highest nutrient value to it can it resist the fatal development of the latent germs which each caterpillar seems to carry. Poor nutrition permits this development, and speedily. Study shows that white pine furnishes the worst food for the gipsy caterpillar, while oak leaves give the best. Between these extremes stand the nut and fruit bearing trees, the commoner shade trees and soft woods generally, varying in quality with reference to this point. It thus appears that the caterpillars get sick and die most quickly when feeding upon white pine, pure stands of which may be saved from their attack at reasonable expense; whereas they are extremely destructive to all the oaks, whose leaves keep them strong and healthy.

It would be extravagant to say that all the oak in this country is doomed to destruction; yet it remains true that unless this moth pest is somehow controlled our oak woods generally will be seriously hurt. Prevention of this in a large portion of the area infected is simple. This area is the natural home of the white pine, which reproduces freely if given half a chance; but there are thousands of acres in which the natural reproduction is being retarded, if not destroyed, thru the mere circumstance that the oak chanced to secure a running start, by sprouting, when the ground was last cut over. Under such circumstances oak is to be considered as a weed, to be got rid of so as to afford the pine a better opportunity to take possession of the ground. How this may best be accomplished depends entirely on the characteristics of each wood lot.

In general the battle against the gipsy moth seems to have become a task for the forester rather than the entomologist, not forgetting the great service the latter has rendered by the introduction of so many effectively destructive parasites; and the various public agencies engaged are anxiously soliciting the intelligent cooperation of forest owners, especially in checking the further spread of the evil.

ERNEST INGERSOLL.

Futurist Paintings by Cave Men

The prehistoric decorations of newly discovered caves near Albacete in Spain have more than a scientific interest, for they afford us not only one of the fullest and most perfect collections of paleolithic art, but are also so well executed as to awaken the admiration of a modern artist. The French journal *L'Anthropologie* reproduces the entire collection, with an explanatory article by the Abbe Breuil, who is the greatest living authority on cave decorations. Simple and naive as the pictures are, many of them are of such liveliness and spirit that they vie with the modern cinematograph in their power of suggested movement. There are, in all, seventeen human and seventy-five animal figures, together

with many signs, mostly records of hunting and war. Among the animals there are twenty-six deer, five oxen, two horses, three stags, one elk and five wolves. It is from the oxen and horses that the age of the paintings is shown to have been since the domestication of animals, which places the date less than forty thousand years ago. Other characteristics of the paintings place their execution at approximately twenty thousand years ago.

THE TROGLODYTE HUNTER AND HIS GAME

The cave walls are palimpsests. For example, the well drawn picture of a horse in the lower left corner overlies a crude figure of some animal, here shown shaded.

One very striking feature of the paintings is that they suggest so strongly the customs of other primitive peoples living in parts of the earth remote from Spain. Some of the figures of men wear a head dress similar to the feathered war-bonnet of the American plains Indian. Some wear a loin cloth like that of the Nubians of ancient Egypt. One figure seems even to be carrying an umbrella. Another, wearing a suggestion of a straw hat, seems to be climbing a rope by a peculiar method affected by Australian savages. Still another scene appears to depict the age-old situation of a cow running away, leaving the milker behind with the overturned milking stool. Figures of women are decorously clothed in long skirts, tho one indeed wears a bodice resembling a low-cut evening gown. All the paintings are executed in a uniform color of dark red or brown ochre.

Whether there was any connection between these ancient Iberians and their contemporaries of North America or Africa is impossible to determine save by the implication of the similarity of custom. But there is a very distinct connection between the men who painted and enjoyed these pictures and modern men. It lies in what Stevenson has called "the touch of life." This far-off people were, after all, very human. They looked out upon the same face of nature and found it so interesting that they wished to make a record of it. They amused themselves in many of the ways that we employ now and they also seemed to have a sense of humor.

The Stars

Among the eleven departments of research to which the Carnegie Institution gives its chief attention and expenditure, two have to do with astronomy, one that of Meridian Astronomy, which receives $26,316, and the other the Solar Observatory, which last year required $254,075, about a third of the appropriations for all investigations, whether of the eleven departments or of the minor grants, a large part being

for telescopic apparatus and buildings. The tower telescope is the largest in the world. It is not a tube, but has the five-foot reflector mounted on an open tower of 150 feet, giving it immense magnifying power. Besides forty or fifty spectroscopic double stars discovered, it has been useful in discovering the radial velocity of stars, one of which surpasses all hitherto discovered, having a velocity of about 150 miles a second. The total velocity may be considerably greater, as the radial velocity only concerns the speed with which the star approaches to or recedes from the earth, while the other element at right angles thereto may be considerable. The task before the astronomers in charge is chiefly a double one, namely, to study the development of stars, that is, how they originate and how they decay; and also to learn what are the stellar streams, that is, whether they have a common motion, or whether there are, as Professor Kapteyn and Professor Boss hold, two or more streams.

This five-foot telescope is a reflector. A great effort has been made to supply an object glass for a refracting telescope with a diameter of over eight feet, but thus far the disks cast have proved unsatisfactory, due to the irregular cooling of the glass, which prevents homogeneity. Nevertheless, it is believed that success will finally be achieved, perhaps with a thinner disk.

A considerable task now being undertaken is to learn the relation of auroras to the sun.

The Situation in Mexico

The revolt in northern Mexico against Huerta's Government has become so formidable that General Aubert, with several thousand soldiers, was sent, last week, to attack the forces led by Carranza. Sonora's Congress formally repudiated Huerta, and a majority of the Coahuila Legislature took similar action. Some thought that Sonora, Coahuila and Chihuahua might attempt to secede and become independent. At the end of the week it was asserted that Carranza had been defeated by Aubert. Troops were also needed in the south, where Zapata refused to be pacified and new bands of insurgents were sacking towns within 40 miles of the capital. Near Douglas, Ariz., there were collisions between Mexican soldiers, said to be rebels, and the United States cavalry patrol on three successive days. In the first engagement six Mexicans were killed. In each case the attack was made by Mexicans. No American soldier was hurt. Emilio and Raoul Madero, brothers of the late President, reported to have been killed by Huerta's forces, escaped by riding 600 miles, from Torreon to the Texas border. They assert that their two brothers were murdered, that Francisco was tortured and that Gustavo was shockingly mutilated. Huerta insists that these stories are false. The late President's father and uncle and several other members of the Madero family are now in New York. Attacks upon Ambassador Wilson have been published in that city. It is asserted that he was hostile to the Madero Government and that his influence was exerted in favor of those who overthrew it. Evidence in opposition to these charges has been brought forward.

The Capture of Janina

The city of Janina, more properly called Yanina, has at last fallen to the Greek assault, leaving Adrianople and Scutari as yet uncaptured, the one besieged by the Bulgarians and the other by the Montenegrins.

Janina is a strong Turkish fortress only a few miles from the Greek frontier in Albania, the old Epirus, which stretches along the western coast of what was, till a few weeks ago, European Turkey. It has a famous history in old Turkish campaigns, particularly in the revolt of Scanderbeg against Amurath in the fifteenth century, and in the end of the eighteenth century in the wars of the tyrant Ali Pasha. On Thursday of last week the city capitulated to the Greek army and 32,000 Turkish prisoners were taken. A fierce bombardment had continued for two days which silenced the Turkish batteries. One after another they were captured by brilliant assaults, until having no further means of defense, Essad Pasha was compelled to surrender to the Crown Prince, who has been in command of the Greek army. As soon as the fortress had capitulated, the Greeks sent in all their spare provisions to relieve the distress of the inhabitants.

The news of the success was received with wild cheering in Athens, and this victory, added to the previous capture of Salonika, will wipe out the discredit of the defeat of Greece in the previous war with Turkey in 1897. It is not likely that Greece will now consent to yield Janina to an independent Albania, as has been proposed, but she will insist on a considerable rectification of her border to the north. The difficulty about it comes from the fact that while the population of Janina is mostly Greek, that of Albania is mostly Moslem. This defeat is likely to make Turkey more ready to submit to the inevitable loss of Adrianople and Scutari.

The Members of the New Cabinet

With the career of Mr. Bryan, Secretary of State and head of the new Cabinet, the American people are already quite familiar. He has been nominated for the Presidency by his party three times, and has been three times defeated. In his first campaign he stood for the free coinage of silver at the ratio of 16 to 1. His third defeat was in 1908, when he received more votes than were cast last year for Mr. Wilson. But the Republican party was united in 1908. Mr. Bryan was born on March 18, 1860, in Salem, Ind. Having been graduated at Illinois College, he was admitted to the bar, and for four years he practiced law in Jacksonville, Ill. Then he became a resident of Lincoln, Neb., where he was elected a member of Congress. His nomination for President in 1896 was due largely to a notable speech made by him in the convention. During the war with Spain he was made a Colonel of Volunteers. In 1901 he began the publication of his paper, *The Commoner*. As a lecturer he has enjoyed great popularity and accumulated a considerable fortune.

A STUDY IN SMILES

William G. McAdoo, Secretary of the Treasurer, is forty-nine years old, and was born near Marietta, Ga. His father was a judge, a soldier in the Civil War, and, later, a professor in the University of Tennessee. War having swept away the family property, the son was unable to complete his college course. He became the clerk of a court, studied law, and was admitted to the bar at the age of twenty-one. Eight years later he came to New York, where he practiced in partnership with a William McAdoo, to whom he was not related. In 1902 he organized a company and set out to make tunnels under the Hudson River. Six years later the first of the tubes was opened. He has been president of the company that owns the tunnels and the great terminal buildings. "The public be pleased," were the words that characterized his policy. In last year's campaign he was the acting chairman of the Democratic National Committee.

MR. BRYAN ARRIVES

The new Secretary of State and his always clever wife make their appearance on the reviewing stand at the inauguration.

James C. McReynolds, Attorney General, born at Elkton, Ky., February 3, 1862, is a graduate of Vanderbilt University and the law department of the University of Virginia. In the first of these institutions he

WILLIAM B. WILSON
Secretary of Labor

WILLIAM G. McADOO
Secretary of the Treasury

JOSEPHUS DANIELS
Secretary of the Navy

was a professor for three years. He was an Assistant Attorney General of the United States from 1903 to 1907, and was employed afterward by the Government in the prosecution of the Tobacco Trust and anthracite coal cases. It will be seen that he is familiar with the work of the Department of Justice.

Postmaster General Albert S. Burleson, born at San Marcos, Tex., June 7, 1863, has been for fourteen years a member of the House, where recently he has served as chairman of the Democratic caucus. He is a lawyer and was educated at the Agricultural and Mechanical College of Texas, Baylor University, and the University of Texas.

The new Secretary of the Navy, Josephus Daniels, is the editor of the Raleigh, N. C., *News and Observer*, and was head of the Democratic Publicity Bureau in the recent campaign. He was born at Washington, N. C., on May 18, 1862, and he began his newspaper work at the age of eighteen. For sixteen years he has been North Carolina's member of the national committee.

Franklin Knight Lane, Secretary of the Interior, has been a member of the Interstate Commerce Commission since 1905, and was recently chairman. He was born in Prince Edward Island on July 15, 1864, and was graduated from the University of California. For several years he practiced law in San Francisco, and for five years he was corporation counsel there. In 1902 he was a candidate for Governor of the State, and in the following year he received his party's vote in the Legislature for United States Senator. He thinks there should be a Federal Trade Commission, like the Interstate Commerce Commission, for the regulation of great manufacturing corporations and combinations.

William C. Redfield, Secretary of Commerce, has been a Representative from Brooklyn, and is known as a vigorous advocate of downward revision of the tariff. He was born at Albany, N. Y., on June 15, 1858, and for many years has been connected with large manufacturing companies. He is a director of the Equitable Life Assurance Society, a trustee of several clubs and the Young Men's Christian As-

sociation. He has recently written a book entitled *The New Industrial Day.*

David F. Hueston, Secretary of Agriculture, born in North Carolina on February 17, 1866, gives up the office of chancellor of Washington University, in St. Louis. He was educated at South Carolina College and Harvard, and has been professor of political science at the University of Texas, president of the Agricultural and Mechanical College of Texas, and president of the University of Texas. Holding degrees from several institutions of learning, he is a member of the Southern Educational Board and many learned societies.

Lindley M. Garrison, Secretary of War, has been a vice-chancellor in New Jersey since 1904. He was born in Camden, N. J., on November 28, 1864, and is a brother of Supreme Court Justice Charles G. Garrison. A graduate of the University of Pennsylvania, he was admitted to the bar in 1886.

LINDLEY M. GARRISON
Secretary of War

ALBERT S. BURLESON
Postmaster General

FRANKLIN K. LANE
Secretary of the Interior

The head of the new Department of Labor, William B. Wilson, is a native of Blantyre, Scotland, where he was born on April 2, 1862. He came to this country with his parents in 1870, and at the age of nine years he began work in the Pennsylvania coal mines. He now has a farm at Blossburg, in that State. A member of the board that organized the United Mine Workers of America, he was for eight years secretary-treasurer of that union, and he has been a Representative in Congress for two terms.

Lincoln Hall, University of Illinois

Of the many institutions which had their origin in the Federal Land Grant Act of 1862, the University of Illinois is one of the largest and most important. This act was passed thru the influence of Abraham Lincoln, while President. In a sense, then, he may be considered one of the founders of the University of Illinois, and on February 12, 1913, the anniversary of his birthday, a memorial building, called Lincoln Hall, was dedicated in his honor upon the campus of the University of Illinois.

This building is decorated in such a manner as to ever remind those working in it, or passing by it, of what this man and his co-workers did for the American people. Over the main entrance is the inscription, Lincoln Hall. Across the front of the building, and above the second story window, is a series of ten panels in terra cotta, representing scenes in the life of Lincoln, from his rail-splitting days on the Sangamon to the close of the Civil War. On the ends of the building, in a similar position, is a series of inscriptions, containing quotations from Lincoln's speeches and writings, flankt by medallion portraits of men closely associated with Lincoln in various capacities: Seward, Stanton, Welles, Grant, Farragut, Yates, Chase, Sumner, Adams, Greeley, Turner, Douglas, Trumbull, Logan, Oglesby, Davis, Lovejoy, Palmer, Koener and Medill. Just within the memorial entrance and sunk in the marble floor is a brass plate bearing a copy of the Gettysburg address; while at the back, facing the visitor, is a marble stairway winding around a niche for a statue of the great emancipator.

The hall is devoted to the study of the humanities: classical and modern languages and literatures, history, philosophy and the social sciences. There are libraries and laboratories for research, besides rooms for instruction, for the *Journal of English and Germanic Philology;* and for the investigations for research in Illinois history. There are also museums of classical archeology, showing the influence of Greek and Roman arts on American life; and a mu-

seum of European culture, illustrating the growth of art, sculpture, the crafts, etc., in Europe.

The Long Parliament

The longest Parliamentary session known to British history came to an end last Friday. Parliament convened on February 14, 1912—a little earlier than was expected owing to the distress caused all over England by the strike of the coal miners. It passed the Minimum Wage bill for miners and then continued in session until August 7, when it took a vacation of two months. Reassembling on October 7, it sat continuously with a break of only five days at Christmas until it was prorogued by King George on March 7. The respite for the members was short, for already the new session—the session of 1913—has begun. This is necessary because Parliamentary appropriations for carrying on Government services must be made in March. The prolongation of last session was largely due to the existence of the Lords Veto act. Bills to get the benefit of the act must be passed by the House of Commons one month before the end of the session. The Home Rule bill was passed before the end of January, but it was February 5 before the Welsh Disestablishment bill was thru the House of Commons, and two days later the Osborne bill, passed at the dictation of the Labor party, was sent to the House of Lords. It was in order that these three bills should have the benefit of the Lords Veto Act and be passed into law even without the consent of the Upper House in 1914, that Parliament remained in session, not doing much more than marking time for a month after the 7th of February.

Fifty Years Ago

THE NATIONAL RESOURCES AND CREDIT

By Horace Greeley

The Government of the Union has now fully One Million citizens in its service and pay, mainly in its Military and Naval service, and its Expenditures henceforth until the Rebellion shall be substantially crushed cannot fall much if at all below Three Millions of Dollars per day. Building, shielding with iron, and repairing vessels of war; hiring fleets of steamboats and sailing craft for the transportation of men and munitions; buying arms, casting cannon, making up millions of cartridges, etc., etc., are constantly going on, at a heavy cost; while the consumption of horses and wagons, of railroad cars, and every vehicle or device whereby armies are moved or their subsistence supplied, is constant and immense. Should the Rebellion hold out a year longer, the public expenditure for that year can hardly fall short of One Thousand Millions of Dollars; while so great is the present amount of unsettled or at least unpaid claims against the Treasury, that it is likely to absorb the current revenue from taxes; so that nearly or quite the full amount above-named must in some form be added to the National Debt.

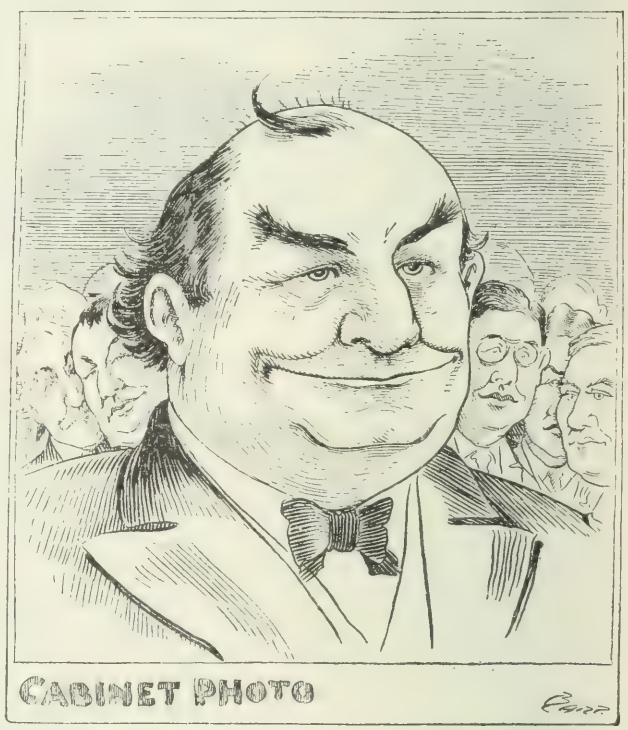
Let every patriot accept and fulfill the obligation of aiding by whatever means to uphold the National Credit through the eventful year now upon us—let him improve every opportunity to secure investments in Government Securities, remembering that an increase in the number of public creditors is desirable, and that if a fourth of the heads of families in every loyal State were among those creditors, the disloyal threats of further disruption and division would be idle, and the repudiation of the National Debt a moral impossibility. He who is too old or too infirm to enlist, should be the more eager to do for his country whatever is still within his power; and in no other way can many be so effective as in persuading their friends and neighbors to follow their own example in selling lands, mortgages, notes, or whatever property they may have, and investing the proceeds in those Securities whereby "the sinews of war" must be provided, and the Republic carried successfully through its terrible ordeal to a future of Peace and Prosperity, based on Universal Justice and Freedom.

Pebbles

Widow—Wait, I'll get you some glue with which to fasten his wig.

Undertaker—Oh, that's not necessary. I've just used a couple of tacks.—*Punch*

Fritz—How do the sausages happen to be so tasty today?



Fritzi—Oh, one of the neighbors gave me a pointer!—*Columbia Jester.*

The motto above the great editor's desk read: "Accuracy, Accuracy, Accuracy."

Therefore, the story turned in by the cub reporter contained this statement:

"Three thousand nine hundred and ninety-nine eyes were fixt upon the speaker."

ADVERTISING AFFIRMATIONS
BY GEORGE FRENCH

VIII—Advertising Rates

In the anxiety displayed by some of the well-intentioned people who feel that nothing is worth while that cannot be submitted to analysis and definite statement, there have grown up some false notions regarding the worth of advertising—about the just rates for advertising. It has been the idea of these people that the rate to be charged by a magazine, let us say, for its advertising space must be based upon the returns to the advertisers that can be ascertained and reckoned. This idea has led to something like an approximation to a theory that the value of all advertising is dependent upon the volume of circulation, and therefore that the advertising rates of periodicals should be fixt by the volume of their circulations—at, say, so much per thousand of circulation. It has come to be thought that magazines of general interest may hope to get somewhere near half a cent per thousand per agate line of space, or 7 cents per inch per thousand, while trade or class papers may get 1 cent per thousand per line, or 14 cents per inch per thousand.

That this, or any theory based upon this principle, is essentially unfair to advertiser and publisher is apparent once the matter is considered in the light of the facts surrounding the periodical publishing business. The only basis for reckoning the value of advertising, from the point of view of the publishers, is what the magazine, on its part, is able to do for the advertiser who knows how to advertise in that particular periodical.

The results of advertising are so uncertain, and so varied, that it is manifest that there can be no rate that is just for one periodical which can by any possibility be just for all, assuming that the volume of circulation shall always be the ratio-fixing principle. The periodicals offer the only ascertainable element of value in advertising. According to the purchasing power of the readers of a periodical, and their devotion to it, the advertising value goes up or down. This advertising value can only be *offered* by the periodical. It cannot be *delivered*. If the advertiser receives it, it will be because he knows how to make an advertisement that will appeal to the readers. In other words, the element of chance in advertising is all in the hands of the advertiser. The publisher offers something that has a fixt and ascertainable value—his circulation, its volume and character.

Each periodical, or other advertising medium, has its field. It may be large or small. It may be rich or poor. Each periodical also has its fixt production cost. If it is well managed, its publisher knows how much it costs him to issue his product—so much for the manufacture of the text pages and so much for the advertising pages, and so much per copy for the completed periodical. He knows also about how much advertising he can carry, and is therefore able to reckon his income pretty closely. He knows at what rate he can afford to print advertisements—and that is the proper rate for him to charge. Quantity and quality of circulation, the relations between the periodical and its readers, the length of time they have been readers, the ratio of unsolicited renewals every year, the volume and character of the correspondence between readers and editors, the general excellence of the periodical, the number and standing of its editors, its business policy—are the basic elements of value.

If all of the elements of advertising value are carefully investigated and estimated by advertisers, and if they are willing to pay for all the advertising value they get, and no more, there will be a revolution in the methods of assessing rates. It is easy to believe that one periodical may be worth to shrewd advertisers ten times as much per thousand of circulation as another periodical, or twenty times as much. It all depends upon the character of the readers and their degree of devotion to the periodical. But little real significance should be attached to mere numbers. It is not difficult to get large numbers of names on to a subscription list. It is difficult to keep the same readers from year to year. It is also difficult to get a large number of people to subscribe for any periodical, of their own free will. Any one of the great circulations would fall to less than one-fourth if left to itself, while many of the medium-sized circulations would remain almost stationary for years, unless they showed a small gain from year to year.

That periodical which has a circulation that is stable because of the sympathy between editorial policy and readers is more valuable to advertisers, and is of course justified in fixing its advertising rate on a higher scale than can be justified for a periodical not having so stable a circulation.

IN THE INSURANCE WORLD

BY W. E. UNDERWOOD

Perversity of Some Compilers

At some time in the recent past the United States Fidelity and Guaranty Company of Baltimore compiled and published, presumably for advertising purposes, a statistical table exhibiting the "history of business done since organization by the companies which were in operation January 1, 1912," the ultimate object of the effort being to present the comparative underwriting profit made by the companies, thirty-one in number, included in the list. In such an undertaking it is to be expected that the company making the comparisons will not appear at a disadvantage and, therefore, it is with no astonishment at all that the student of the table discovers the largest profit achieved appearing against the name of the United States Fidelity and Guaranty. And that is precisely as it should be, if no one can pick flaws in the methods used in handling the figures. While the making of underwriting profit in all forms of insurance (except life) is not an unfailing evidence of underwriting ability, it may be accepted as an indication of skilful management.

But Mr. Henry D. Lyman, former president of the American Surety Company, and still active in the direction of that company's affairs as chairman of its board of directors, has publicly challenged the results of the compilation in so far as they affect his company. By way of introduction to his analysis of the figures presented in the United States Fidelity and Guaranty's table, Mr. Lyman recalls a publication by another surety company in 1911 which, because of the omission of certain statistical information, was defective in its conclusions and worked an injustice to other companies, the United States Fidelity and Guaranty among them, and which he criticized adversely at the time. He then proceeds to show that in the present instance the compiler has omitted the figures of the Fidelity and Casualty Company. We will add that the latter is the oldest company in the business, and it is reasonable to presume that its aggregated income and disbursements, and perhaps its profits since organization, run into very large figures. This omission, says Mr. Lyman, leaves the reader to infer that the promulgator of the table conspicuously leads all other companies in the sole particular of underwriting profits, and that responsibility for any inaccuracies in the presentation is shifted to tables printed in September, 1912, by a Chicago insurance journal. Mr. Lyman then takes up the matter at the point where it immediately touches the American Surety Company. He says:

> The particular transgression of which the American Surety Company complains is the presentation of the sum of $500,780 as its total underwriting profit from the middle of 1884 to December 31, 1911, a period of twenty-seven and a half years, whereas the correct amount should have been stated as $5,762,924.22, or an error of $5,262,144.22, against this company. Assuming that the Baltimore *Argus* was not partially in the arms of Somnus, and was uninfluenced by Morpheus, when making the compilation, and, therefore, was wide awake and accurate in the presentation of its figures, the United States Fidelity and Guaranty Company, instead of "outstripping all its competitors" (to quote the circular) in a period of about fifteen years, falls behind the American Surety Company in the modest sum of $4,276,686.22—A. S. Co., $5,762,924.22; U. S. F. and G. Co., $1,486,238; total, $4,276,686.22. The underwriting profit of the American Surety Company during the fourteen years preceding December 31, 1911, was $3,988,747.19, or $2,502,509.19 more than that of the compiler for its fifteen year period—fourteen years A. S. Co., $3,988,747.19; fifteen years U. S. F. and G. Co., $1,486,238; total, $2,502,509.19.

We are quite safe in concluding that Mr. Lyman, who has been continuously and actively in the service of the American Surety since 1885, is in a better position to give reliable information respecting its aggregate profits than the gentleman who, passing over the extant official reports, constructs a table based upon the former compilation of another person; and we may accept without hesitation the figures he gives us, $5,762,924, as representing the underwriting profit of his company since its organization. With that correction, the American Surety Company stands first in the list instead of the United States Fidelity and Guaranty.

In his mild and sarcastic way, Mr. Lyman is disposed to acquit the maker of the table of any intentional misrepresentation. As a matter of fact, he seems to suspect his competency for the task assumed, for in a footnote to his article he estimates that the profits of the United States Fidelity and Guaranty have been understated.

A man may be a fair mathematician, perhaps it would be more accurate to say a good calculator, and yet be a poor reasoner, and thru that infirmity, incapable of properly assembling the figures he is trying to

use. This is the inherent defect in many statistical tables. Such compilations are injurious. They misrepresent the facts and mislead those who, lacking detailed information, place reliance in them. The present case is but one of many that are constantly occurring, and it is used here only as an illustration for the benefit of our readers, the great mass of whom are unacquainted with technical insurance detail. Sometimes figures are made to prove the material existence of that which is but a myth. It all depends upon the conscience or ability of their manipulator.

Capitalizing Dividends

The recent announcement made by a Baltimore company that transacts a surety and casualty business, of an extra cash dividend to stockholders at the rate of 9 1-11 per cent on the capital stock, simultaneous with notice of a new issue of stock to the amount of $250,000, present stockholders to be preferred as subscribers at one share of new for every eleven shares of their present holdings, suggests an observation we would make for the benefit of our readers. The transaction noted above is entirely regular and proper, and we have no criticism to make of it; for while it is actually a capitalization of profits, the line of business transacted renders it reasonably permissible.

But the past history of life insurance is just a bit too full of that sort of thing, and its repetition should never again be possible. A number of companies in excellent financial condition and public esteem today, organized twenty-five to fifty years ago on a stock basis, commenced business with a nominal sum of money paid in and as the years went by and profits accrued, their capitals were increased to extravagant amounts—sums far beyond the needs of the business. And all these capitals are yielders of large dividends annually.

During the past six years several hundred new life insurance companies have been organized on the stock basis, the greater number of them with $100,000 capital each. As the laws of most of our States virtually prohibit the organization of pure mutuals, it is but natural that the men promoting them should resort to the stock form. Experience abundantly proves that a life company once fairly started and capably managed needs no capital whatever. For that reason, going companies of that class should be prohibited from increasing their capitals; and the custom of capitalizing surplus should be regarded as a grave irregularity.

Title Guaranty and Surety Company

The annual financial statement of the Title Guaranty and Trust Company, indicating its condition on December 31, 1912, shows total assets consisting of Government, railroad and miscellaneous bonds, real estate, mortgages on real estate and cash of $2,343,644, with total liabilities, including capital stock, of $1,774,471, leaving a net surplus of $569,173. Comparing these figures with those of a year earlier, we find an increase in assets of $272,102 and in net surplus of $93,299. In considering the gains we are bound to take into account the increase of capital stock made in 1912, amounting to $287,180, a sum which, in calculating the gains, we have included in the liabilities side of the statement. Viewing the matter from another point, that of the bondholder, this addition to the funds makes its appearance in the heavy gain made in surplus for the protection of bondholders, which rose from $1,188,694 on January 1, 1912, to $1,569,173 at the end of that year—an increase of $380,479.

The showing is one of substantial progress during the past year and of increased security to the holders of the company's contracts.

Notes

Sixteen foreign fire insurance companies doing business in Michigan have paid fines of $307 each for writing single policies in sums exceeding 10 per cent of their deposits in the United States.

A Minnesota legislator is being jeered at for offering a bill making it a misdemeanor in a housewife to "steal" the servant of another. But a law prohibiting an insurance company "stealing" another company's agent is approved as a matter of course.

The Insurance Committee of the New York Senate has formulated and reported a bill designed as a substitute for the two workmen's compensation measures—the Murtaugh-Jackson bill, supported by the labor organizations, and the Foley-Walker bill, backed by the Insurance Department—over which have arisen among legislators apparently irreconcilable differences. The principal new features of the Senate bill are the elimination of the courts, except on points of law; rejecting the principle of presumptive acceptance; and requiring affirmative action; and the addition of a fourth alternative, to wit: that the employer may elect to contribute to a fund to be administered by the Superintendent of Insurance and to be known as the employees' State mutual insurance fund.

FINANCE & TRADE

Currency Reform

Democratic leaders in Congress desire that the work of the special session shall be confined to tariff revision. Mr. Wilson would like to see something done in the field of currency legislation, but is inclined, it is said, to accept the advice of those who would defer action until the regular session. While it seems reasonable to say that a revision of tariff and the imposition of an income tax will be enough for the extra session, it is unfortunate that currency reform must be postponed. If the Pujo committee had given to the elaboration of a currency reform project a considerable part of the time and energy which it used in its inquiry as to a concentration of money power—"no evidence of abuse" of this power having come to it "from impartial sources"—the new Congress might now be prepared to take up the subject, even at the special session and in addition to the tariff bills.

Coal Wages and Prices

The railroad companies engaged in the anthracite coal trade must not be surprised if public opinion vigorously supports Federal inquiry as to their control of that trade, or Federal action designed to affect that control. Secretary Nagel's report of the results of an investigation made in compliance with a House resolution shows that since the settlement with the miners on strike in May last the miners have received about $4,000,000 in additional wages, while the companies, by an increase of coal prices, have taken from consumers $13,450,000. It will be recalled that prices were increased to compensate for the additional wages granted. Possibly the public would not complain if the addition to the price had yielded only enough, say $4,000,000, to square the account, but the exaction of more than three times this sum from those who buy coal cannot fail to excite sharp protest.

Railroad Earnings

In the year 1912 the gross earnings of our railroads for the first time passed the three billion mark. The total, as shown by the *Financial Chronicle*, for 458 roads, was $3,012,390,000. The year's gross receipts were larger than those of 1911 by $221,579,000, or a little more than 8 per cent. Owing to what has been said about the effect of higher wages, which the employees have gained by arbitration (following plans for strikes), the gain in net earnings excites interest. For the year 1912 it was $60,350,800, or nearly 7 per cent. After the large increases of gross in 1909 and 1910, the figures for 1911 showed the decline of $30,000,000 in gross and $24,000,000 in net, but last year's upward movements caused not only a much greater volume of business but also an encouraging gain in net profits.

Financial Notes

Wilbur C. Fisk has been elected president of the Hudson & Manhattan Railroad Company, to succeed William G. McAdoo, now Secretary of the Treasury. Mr. Fisk has been vice-president and general manager. He was graduated from Princeton in 1890, is a civil engineer, and is a brother of Pliny Fisk, the head of the well known banking house of Harvey Fisk & Sons.

At the recent annual meeting of the Central Leather Company a resolution, offered by a group of minority stockholders, requesting the board to provide for cumulative voting and minority representation, was tabled by a large majority. The annual report showed that the net earnings of the subsidiary companies had increased from $2,278,489 in 1911, to $7,709,205 in 1912.

The American Woolen Company's annual report, covering the year 1912, shows that the net profit was $3,722,987, out of which dividends amounting to $2,800,000 were paid on the $40,000,000 of preferred stock. The surplus was increased by $418,253, and it is now $12,015,624. President William M. Wood says in his report that there was a marked improvement in the volume of the company's business during the year.

At the end of last year the New York Real Estate Security Company's assets were $14,018,514. There had been an increase of about $3,500,000 in the preceding twelve months, owing to the purchase of fourteen apartment houses of the best class. Since the beginning of the present year the company's holdings have been still further and largely increased by the acquisition of much valuable property, and it is now one of the largest owners of first class income-producing real estate on Manhattan Island.

VOLUME 74 NUMBER 3355

Penalizing Parenthood

The Edgell case bids fair to take rank with the Dred Scott case and the Jane Wenham case as one of those defeats which stand as monuments to measure the onward march of progress. In 1857 the United States Supreme Court declared for the last time that the negro has no rights that the white man is bound to respect. In 1712 an English judge for the last time condemned a woman to death for witchcraft. In 1913 the New York City Board of Education decided that a woman teacher has no right to have a child. Would that we might write "for the last time" in this case also, but with a vote of 32 to 5 against Mrs. Edgell we fear that we would not be justified in assuming that the force of reactionism is exhausted.

Fortunately the issue is clear and a plain statement of the case is sufficient to show the enormity of the action. Mrs. Edgell, teacher of physical culture in the Erasmus Hall High School, Brooklyn, and the wife of a teacher in the same school, applied for a leave of absence without pay for one year, stating with unprecedented frankness that she was soon to become a mother. The Committee on High Schools approved the petition, but the Board of Education, on motion of Commissioner Abraham Stern, refused even to allow a discussion of the question. Mrs. Edgell is now liable to dismissal for neglect of duty. If she should later apply for reinstatement she would undoubtedly be refused and if she did manage to enter the school system again she would have to begin at the bottom of the ladder with the lowest salary.

The board is willing enough to grant leave of absence to teachers for recreation, recuperation, travel and study, yet it is blind to the fact that the experience of maternity is far more important than any of these, considered merely from the standpoint of educational efficiency. It would have been much more sensible of the board to have granted Mrs. Edgell a leave of absence for a year and a half with salary and a promise of promotion when she came back. In fact, it may be questioned whether any woman except a mother is altogether competent to serve in the responsible position of physical director to girls of the high school age. In France a woman teacher under such circumstances is allowed a month's pay, and in Great Britain and Australia the Government contributes to the support of working mothers.

But this latest action of the New York Board of Education is what might have been expected from its previous treatment of the thousands of women who are at its mercy. It denied them equal pay for equal work until the women teachers organized in their own defense and by bringing political pressure to bear secured their pecuniary rights. Then the board discharged teachers for marrying—the women, mind you, not the

men—but after a long fight in the courts the women teachers secured their right to marriage. Now they have to make another fight if they are not to be deprived of the most important of all woman's rights, the right to maternity. The Women Lawyers' Club of New York is already preparing to take the Edgell case into the courts.

To readers in our western States this exposure of the treatment of women in New York will seem almost incredible. For their benefit we must explain first that the women in this city have no vote, even on school matters. Second, a large part of the population consists of immigrants from European countries where women are still regarded as inferior beings, having no rights that a man is bound to respect. No one who knows the history of THE INDEPENDENT will accuse it of race prejudice, yet it is necessary to admit that the wave of recent immigration has brought with it the Oriental conception of woman's status. A man whose religion requires him every morning to thank God that he was not born a woman is likely to treat women so that they will wish they had been born men. We must not shut our eyes to the fact that in the future the Christian conception of womanhood is not to be maintained in this country without a struggle.

The Resurrection of the Body

In one of Erasmus's "Colloquies" the questions and answers are over the Apostles' Creed, so called, and, at last the questioner comes to the article of the Creed which in the original is "the Resurrection of the Flesh," but which we usually have softened into "the Resurrection of the Body," tho it means the same thing. It proceeds as follows:

Do you believe in the future Resurrection of the Flesh?

It would be vain to believe the other things, if I did not believe this, the chief of all.

What do you mean when you speak of Flesh?

The human body, animated with a human soul.

Will every soul receive its own body which it left at death?

The very same, from which it departed. For in the Creed as given by Cyprian it says "*this* flesh."

But how can it be that the body, so many times transmuted from one form to another can be restored the same body?

He who can create whatsoever he pleases out of nothing, can it be hard for him to restore to its original nature that which has but changed its form?

I have no concern to ask how it is done. It is enough for me that he has promised it who is so true that he cannot lie, so powerful that whatever he chooses he can do with a nod.

But what need will there then be of the body?

That the whole man may be glorified with Christ, who here suffered with Christ.

All this is a beautiful and facile faith. It takes the words quite too easily. It rests everything on the power of God. It is harder for us, in these days of science, to believe quite so readily what seems unreasonable, and on the authority of a creed which the Apostles never heard.

We prefer to talk of the spiritual body, which is not the body of this flesh. It is the spiritual body which will arise, that is, will survive; and the spiritual body is the soul immortal. We do not understand any other body. So we interpret Paul. And in the assurance of the eternal life with Christ we rest on His promise, "This day shalt thou be with me in Paradise."

The Soilure of Good Names

Last week the son of the author of the *Scarlet Letter* was sent to prison for a year and a day. Also the son of the discoverer of ether was sent to prison for a year and a day. The bearer of the famous name of Josiah Quincy, himself highly honored, was acquitted of fraudulent intent in the frauds of which Julian Hawthorne and William J. Morton had been guilty. They had been engaged in exploiting thru the mails some Canadian mines whose value had never been proved, seeking buyers by false

claims from teachers and others of moderate means. It was their names that gave them credit, their own fair names and the more illustrious names of their fathers.

It is not rarely that a man who has acquired credit and reputation ruins his own good name by some act of fraud or passion. It is much rarer that the case appears of one who soils the good name of a distinguished father. This is a case unparalleled that three names, borne by men among the most famous in our annals, should have been so foully soiled by their sons. It calls to mind the obligation resting on those of less famous lineage to add to the ordinary restraints of duty that of honoring by a worthy life their fathers and mothers who have transmitted to them a name unsoiled.

Merit and the Offices

Mr. Wilson's course thus far with respect to the offices has not been wholly satisfactory to many in his party, but it has been distinctly creditable to himself. It will be recalled that a majority of the Democrats in the House voted to annul the executive order by which Mr. Taft placed 36,000 fourth class postmasters in the classified service and under the merit rules. They would like to hear that Mr. Wilson intends to revoke that order, but he will not do it. Taking up the list of Taft nominations, action upon which had been prevented by the Democrats in the Senate, he promptly renominated Interstate Commerce Commissioner Edgar E. Clark, a Republican, whose term had expired, and Dr. Charles P. Neill, Commissioner of Labor, who had much good service to his credit. Mr. Clark has since been made chairman of the Commission. Dr. Neill's nomination has not yet been confirmed, owing to the opposition of two or three Southern Senators who complain because the Commissioner, in the performance of his duty, made an inquiry and submitted a report concerning the employment of children and women in Southern cotton mills. The vacancy in the Interstate Commerce Commission was filled by promotion for merit, the new Commissioner, Mr. Marble, having been the Commission's secretary. Promotion after years of excellent service made Dr. Galloway Assistant Secretary of Agriculture.

The President has let it be known that postmasters and collectors holding office by Presidential appointment will not be disturbed before the expiration of what are regarded as their terms. His Postmaster General, Mr. Burleson, says that all postmasters should be under the merit rules:

> I would like to see the Post Office Department taken out of politics, and postmasters of the first, second and third classes, as well as those of the fourth class, put in office only after they have passed a rigid civil service examination.

It is understood that these are the views of his chief, and that Mr. Wilson is inclined to follow Mr. Taft in asking for legislation that would subject all postmasters, collectors and marshals to the requirements of the merit system. A few years ago he said in one of his books:

> One of the conditions precedent to any real and lasting reform of the civil service, in a country whose public service is molded by the conditions of self-government, is the drawing of a sharp line of distinction between those offices which are political and those which are non-political. The strictest rules of business discipline, of merit tenure, and of earned promotion, must control every office whose incumbent has naught to do with choosing between policies; but no rules except the choice of parties can or should make and unmake, reward or punish, those officers whose privilege it is to fix upon the political purposes which administration shall be made to serve. The latter are not many under any form of government.

Office-seekers in Washington have already discovered that there are not many, and it appears to be the purpose of the President and his Cabinet to select them with care. We notice that the new Attorney-General has retained four of his predecessor's assistants.

While Mr. Burleson thinks that all postmasters should be on the classi-

fied list, and, of course, does not ask for revocation of the order by which Mr. Taft placed 36,000 fourth class postmasters there, he also thinks that these 36,000 ought not to be "covered into" the classified and protected service without being required to prove their fitness by undergoing examination. He believes, and probably it is true, that many of them, political appointees, are not eminently qualified for the performance of their duties. He would have them subjected to examination, under the civil service rules, and thus would weed out the inefficient. Their places would be vacant, it is true, but political influence would not fill them. Their successors would be selected by competitive examination, and might be Republicans. We see no reasonable objection to the course he has in mind, provided that all the proposed examinations are properly conducted and the selections justly made. The proceedings would be in harmony with the governing principle of civil service reform. It is one thing to place 36,000 offices under the merit rules, and quite another thing to give the protection of these rules to the 36,000 persons who, without examination, hold these offices.

Farm Co-operation

Farmers' organizations of a co-operative sort are not a novelty in this country, altho just now they are greatly on the increase, and it is a problem whether they will not be able to cover a whole field of farm labor and market and finance. Our fathers built coöperatively and did their harvesting by united labor. About the middle of the last century coöperation got hold of cheese production and butter making and then the market of dairy products as well as their production. The development of farm implements brought it about that a single mowing machine or a single harvester did the work of half a dozen or more farms. Threshing and a few other farm needs were also accomplished as a neighborhood business by the farmers and their families.

Just now warehousing is getting to be a matter of special importance to the farmer. At Ravenna, Ohio, a large warehouse has been built for the use of a large neighborhood, the owner getting 4 per cent for the use of his building, and he pays the taxes. The membership consists of four hundred operative farmers, each one owning stock if he chooses, but each one having but a single vote. The concern pays no dividends, and no salaries or commissions, except to a storekeeper, a manager and a helper. The stockholders get their dividends by buying at reduced cost and selling at full market prices. The Massachusetts Patrons are a well known coöperative association, handling in a single year some two thousand carloads of produce and saving over ten thousand dollars on the purchases. A Coöperative Dairying Association is reported in Maine, with expenditures of $1,650,000, covered by receipts of over three millions.

The Fruit Growers' Association of Washington has several hundred members, shipping last year over sixty thousand crates of raspberries and thirty thousand of blackberries, and owning a large canning establishment, where all surplus products are profitably used up. Coöperative stores have not been a general success in the United States, but from Houlton, Me., we hear that the grange store and grist mill do a business of nearly two hundred thousand a year. We hear of only two or three farmers' coöperative banks, one of which pays an annual dividend of 30 per cent and is otherwise flourishing.

Intensive farming makes it desirable to establish a close relation between producer and consumer, and wherever this can be created coöperation is of little importance. It is where truck or fruit or grain must be shipped to a distant market that the American farmer feels the need of associated effort. Yet the cooperative associations in France and Belgium look more to the establishment

of small societies that shall lessen the cost of living. Among these societies relief funds and insurance against illness and against forced non-employment are supplied. They have union arrangements with doctors for their services on a commission basis.

It is, however, the direct relation of producers and consumers that is of most importance in its effect on high prices and cost of living. Every State should provide in its Constitution, as New York has done, to prevent local legislation that shall keep apart those who have the best goods to sell and those who desire to buy. Grocery stuff is rarely made up of new sorts of peas, beans and so forth, because the old sorts sell just as well and make less confusion. The producer who sells directly to his consumers can explain to them the progress in horticulture. They will understand something of what is going on in the way of producing new fruits and vegetables. They will learn how to buy the best, as well as the freshest. This method provides good goods, because the consumer can go direct to the seller for compensation. The middleman naturally cares only for that which will show best and sell quickest. His blackberries are all Lawtons and his peas are all Telegraph, altho there may be a half dozen sorts.

The proposition of the president of the National Housewives' League is to use the new parcels post to further this sort of cooperation. Mrs. Heath's plan is to eliminate the middleman altogether. She thinks that apples, fresh eggs and country butter can just as well come direct from the farm to the housewife, and with much more satisfaction to both parties. She would create a registry commitee, a committee that shall keep a list of all farmers within a fifty-mile zone. All housekeepers inside this zone will be allowed to avail themselves of an opportunity to obtain fresh produce. Consumers will get the freshest of food, directly out of the orchards and gardens, at lower prices than they are now paying, while the producers are made happy with just prices for best material. The plan is not far from ideal, and it seems to be quite workable.

United Against Social Vice

Not the Republican nor the Democratic platform, not the Progressive nor the Socialist, with all their searchings for social evils which they would condemn, contained one plank which condemned or pledged them to destroy what is called *par infamie* the social evil. And yet it is the chief of all the evils that both infest and infect society. It blasts more names, it destroys more lives, than does the saloon, or the tyranny of predatory wealth. Our awaking conscience must protect people rather than property; and how shall men and women and the unborn generations be better protected than by putting an end to those foul sinks of corruption, so evil that we have been too much ashamed to speak of them, but in which society sacrifices the dearest wealth of its young womanhood, the strength and glory of its young manhood? Scripture speaks plainly of the house and its ways that lead down to Hell; but we have shut our eyes against what it was too indecent to look upon, too foul to fight.

But the public conscience, too long stupefied, is suddenly awakening. More than a dozen States, and soon it will be, or should be, forty-eight States, have appointed commissions which will thoroly investigate the brothel system of our cities, and laws will follow which must not have for their purpose to regulate, but to annihilate, this awful evil. To do this is women's work, for women are the victims; it is men's work also, for men are the tempters, the criminals, and also the sufferers. It is not enough to say that the evil has always existed and that it is of no use to try to destroy it; that the parade of vice must be cloaked in simulated decency, or that white slaves must not be transported across State lines, or that the traffic must be segregated

in certain streets, or that medical inspection must protect patrons from that disease which affrighted Europe when at the end of the fifteenth century, under the name of the *morbus Hispanicus,* in only four years it blackened its broad track from Madrid to Rome, and which now wrecks tenfold more lives than does the black plague or the white. As we fight the saloon, and with manifold reasons, so should we fight the public brothel, in the name of pure womanhood and pure manhood, in the protection of marriage, of family life, of our sons and our daughters.

Nor let it be said that it cannot be done, that the evil is inherent in human nature, has always existed and everywhere. That is not true. Human nature does not require it; human nature requires marriage, honorable marriage, not harlotry. There are in this country tens of thousands of towns and villages which would scorn to harbor a nest of commercialized vice. These resorts are the shame of cities, and are no more needed there than in the country districts.

We trust that the commissions will agree to urge laws for a minimum wage for girls in factories and shops. That is something, but it is only a palliative. It removes somewhat one temptation from those more easily tempted. What is needed is absolute suppression, laws that will forbid and pursue the evil, while merciful provision shall be tenderly made for the present victims of the traffic. In a number of our cities the brothels have been closed, and it can be done everywhere if the public conscience will demand it. It will be difficult, it will require persistent work and an honest and faithful police. But it can be done. The saloons may find honest defenders; the brothel can find none. The only arguments for its permission are cowardice and weakness. We appeal to the conscience, even to the self-interest of good men and women to enact and execute laws which will do more to purify society and save the bodies and souls of our people than any other reform that can be named. Why have we neglected it so long? Let every State take up the task.

Steel and the Panic

In a recent issue of a paper called *The National Herald,* published in Philadelphia, there is a long article, signed by Christopher Gallagher (vice-president of the company that owns the paper), in the course of which we find the following:

> Every thinking man knows that Morgan, Perkins, Rockefeller, Frick and other millionaires associated with them may start a panic any time or day that they make up their mind so to do, just as they did in 1907. Morgan and his associates wanted possession of the Tennessee Coal and Iron plant. Morgan got the Tennessee Coal and Iron Company merged into the United States Steel Corporation, it being the only competitor that the Steel Trust had.

This remark that the Tennessee Coal and Iron Company was the Steel Corporation's only competitor will be news to Mr. Schwab, of the Bethlehem Company, to the Republic Company, the Lackawanna, and other concerns commonly believed to be engaged in the manufacture of iron and steel. Mr. Roosevelt showed, some months ago, that the Steel Corporation, just before the purchase of the Tennessee company, had about 58 per cent of the industry's output. This purchase, he said, added only 2 per cent. We do not know that the accuracy of his statement has been questioned.

The assertion that the purchased company was the Steel Corporation's only competitor is as far from the truth as the accompanying assertion that the panic of 1907 was made by a few men for their own profit.

Dangerous Easter Teaching

When we lately criticised the antiquated theologic teaching of the *Sunday School Times* we had no expectation or wish to return to it again; but the last issue received, with its Easter teachings, compels us to offer one more warning.

This is an Easter issue, and it contains a long editorial entitled "What May We Know of the Resurrection Body?" That is not a practical subject for the teaching of Sunday school children. It does not make children or grown people any better to discuss the unattainable. But it is the harmful positive teaching to which we object. The editorial positively declares as the literal teaching of the Bible, to be taught in Sunday schools, that the resurrection body is the same physical body of flesh and blood that will be raised. It says, "The body is the only part of them that can be raised from the dead"; "God redeems and changes mortal flesh and blood into a spiritual body that can inherit the kingdom." More than this, "God jealously safeguards from the power of Satan the flesh and blood of his children in Christ; He recovers it from Satan's temporary death-power by the glorious resurrection change of the body"; and so on at length. This, with Satan's control of the body, is the most extreme teaching of literalism, imposed on young people and their teachers as the word of God. If we are to take the language of the Bible so literally we might as well go to that other extreme which says that the resurrection body must be made of bones, because we are told that flesh and blood cannot inherit the kingdom of God.

This literalism suggests that the editorship has past over into the hands of those few extremists who hold to the personal second coming of our Lord to earth to renew all things. And the next article, by Professor Erdman, substantiates the suspicion. His title is "When Christ Comes Again." and it begins by saying that "Our Easter hope centers in the return of our Lord," which is not true:

> This coming, of which his resurrection makes us sure, is as real and definite and literal as was his appearance to Mary or to Peter, or to the disciples in the upper room, when he ate and drank with them. . . . By the coming of Christ, we do not mean his spiritual presence by which we are now cheered, nor his providence by which we are protected, nor death by which we are summoned into his presence; but we mean *his personal, glorious, visible return,* when he comes with the clouds of heaven, when he appears "a second time," when "every eye shall see him," when this earth which has been shadowed by his cross will be illumined with the glory of his throne.

Then he will have a "throne," literally, in Jerusalem, we suppose. The writer proceeds to give the Sunday schools further information. All the blessed dead of our ancestors will arise with their bodies transformed —for at present they are only naked souls—and will live here on earth with those of us who survive; and a similar transformation will affect those then living. Then will Christ reign over all the earth. But when will he come? Dr. Erdman does not know. All he knows is that first the gospel must "be preached in all the world for a witness," and therefore we should hasten the preaching of it everywhere, in order to hasten Christ's appearing.

This is not the teaching of the Christian Church. It is the teaching of a small fraction of it, a fraction which never learns. We suppose it is what Prof. Charles R. Erdman has taught in Princeton Theological Seminary, but we guess not the teaching of the rest of the faculty.

Annulling a Marriage

It is reported from Paris that in his second application to the Rota, the papal tribunal which has charge of marital matters, Count Boni de Castellane has succeeded in securing the annulment of his marriage to Anna Gould, on the ground that before the marriage she did not accept the indissolubility of Christian marriage. It would appear that his first application failed because he did not present to the Rota sufficient grounds for the annulment of the marriage, and that he has now amended his claim accordingly. The Roman Church is very unwilling to allow divorce, but has various grounds for declaring that a marriage was not valid and can be annulled.

It would appear from the circum-

stances that the Count de Castellane and the Prince de Sagan and his wife are in agreement in this case. The next step will be to have the Rota declare the legitimacy of her children by the Count de Castellane, notwithstanding that the marriage was invalid; and, then, the annulment of the previous marriage allows her to be married in the Catholic Church to her present husband, the Prince de Sagan, and that will legitimatize in the eyes of the Church her son by him, now four years old. Such are the intricacies when the Church claims to have control of marriage at the same time that the State does, and the two conflict, marriage valid by civil law and invalid by ecclesiastical law.

The Mexican Outlook

General Huerta seized the power, killed President Madero and his brother, and made haste to delare to the United States and the world that an era of peace and quietness had begun in Mexico. He was wrong. We heard him and, while we hated his way, we hoped for submission to the strong arm. But we were mistaken. The new President Dictator is beset behind and before, in the north and in the south, and poor Mexico is in arms everywhere. We have read lately a defense of the sort of education and culture which has come to Mexico during these centuries; but, if by their fruits ye shall know them, it has been very bad, as contrasted with the sort which came to the eastern shore of the United States from Great Britain.

What next? It is very doubtful if President Huerta can succeed in holding the rebel States. Particularly the northern States of Sonora, Chihuahua and Coahuila, which border on our States of Arizona, New Mexico and Texas, as setting up a government of their own and inviting the adjoining Mexican States to join them, apparently with the view of secession, independence. And the attempt would stand a good chance of success. Southern Mexico has no such means of coercing them as the Northern States had of coercing the South in its attempt for a new confederacy.

But what would that mean? It would not be likely to mean war with the United States. We should have no occasion to intervene. Yet the destiny which led Texas to seek annexation to the United States would probably follow the new Mexican republic. The fighting would be on Mexican soil, between Mexicans; and then would follow the inevitable; the apple would drop. We should not seek it, neither would we decline it. It would be a burden, a responsibility, but a great blessing to the ceded territory, whether received as Territories or States. It would give them peace and prosperity. There is an immense amount of American capital there now, with many thousands of American citizens, and the new relation would do for that magnificent region what has been done since 1849 to the territory then ceded.

This is speculation, but the movement has started in that way, and there will be many who will wish it and be ready to pay for it; and it is well to hold the contingency in mind.

Orthographic Beauty

The one complaint brought against efforts to rectify the crookedness in the spelling of the English language is that any change is ugly. The old and familiar spelling, with all its useless and misplaced letters, has been learned with such labor and we are so used to it, that it is thought beautiful; a sort of discord in music, by contrast to highten the melody.

But is this our crooked orthography, better called scoliography (crooked, not straight, writing), really, essentially, beautiful? Can it be denied that the *gh* in *ought, aught, might, right* is ugly? It is ugly because it is useless. A weed in a garden is ugly because it is a plant, in itself fair enough, but ugly because in the wrong place. Dirt is matter in the wrong place. The *gh* in *right* are letters in the wrong place. Equally the letter *w* in *wrong* is in the wrong place. It is superfluous, like a rag-

weed in a rose-bed. We do not mean to say that in itself a rag-weed is ugly, for it is not, nor that the letter *g* is formatively ugly, or ugly in the right place. It is not. Its upper half is as beautiful as any shape in nature or art, a circle, or a circle flattened a bit, no less beautiful and its monotony freshened by its varying curvature; and the lower portion, a noose, as graceful as a pig's tail. But put it in *ought,* where it ought not to be, and it is as needless, as mischievous as a sliver in a lady's fair finger and requires surgery.

And yet there are those who delight in the excrescence. A wife learns to love the wen on her husband's face. Oliver Cromwell bade the painter not to fail to perpetuate the wart on his cheek, and there are those, perhaps, who would miss the goitre on a friend's neck. Nevertheless the human body is not adorned by such aberrations from pure simplicity, and is more beautiful without them; and a clean word, purified of the letters that choke it, spelt after the predominating rules that indicate English pronunciation, loses ugliness, gains real beauty. *Rite* is more beautiful than *right, taut* than *taught.* It is the long perverted custom of evil that cannot see it. To the child the useless *gh* has a hideous mien, but seen too oft he learns first to endure it, and some, unfortunately, learn to embrace it. The weakness, the folly of it, is that of the inebriate who clings to the cups that are sapping his strength and starving his children.

Reforming the British Constitution

The present British Ministry has carried thru the Liberal House of Commons wonderful reforms, but of them all that which is now proposed, and which is likely to be achieved before the term of this Parliament expires, is the most radical, the most amazing. Other reforms have been amendments, serious amendments to what is called the British Constitution, but this is more than amendment, it makes really a new Constitution. The very proposal of it, with the assurance that it will be accomplished within three years, marks an epoch in the history of the British nation, a change from the government by a limited aristocracy, under a fictitious monarchy, to a genuine and complete government by the democracy.

The British Government, taunted by the Conservative opposition because they have put thru the Irish home rule bill and the Welsh disestablishment bill before reforming the House of Lords, has answered by declaring that a bill will be speedily presented to reform the House of Lords so drastically that there will be left in it no vestige of hereditary right. Every member will be elected by the people. It had been proposed by the more politic of the lords, by such men as Lord Rosebery, that the lords should elect a number of their members, say two or three hundred, who, with others elected or appointed, should constitute the second chamber. But the Cabinet and the Commons will have not one of them. They must all go, lord and lord bishop. Not one shall be in the reformed house except as he is elected like any commoner. They shall all be turned out, and come back only as Mr. Jones or Mr. Smith comes.

This we say is a stupendous revolution, but it is not so daring as it looks. It is good politics as well as good statesmanship. The Conservative party has been catching at every device to secure some sort of a defeat of the ministry and compel resignation and a new election, in hopes to prevent the final enactment, within the stipulated period of two years, of the two bills, home rule and Welsh disestablishment. It might be possible that a new election would give the government to the Conservatives. But with this bill for the reform of the House of Lords on the docket, that would be the chief question on which the people would give a mandate; the others would be secondary. But we believe that the radical reform of the House of Lords would be overwhelmingly popular. It would

carry everything else with the electorate.

What would remain? Only titles, nothing more. Even the King is but a title, and so would be princes and dukes and all the rest down to barons, just ornamental prefixes that mean nothing, only a little faded, moth-eaten tapestry of dignity that has past its day. This is the age of the masses, no longer of the classes. And it is well that the people rule and privilege passes. But it is glorious to live in this day and see the revolution culminate which has courage to trust the prophetic word that *vox populi* will be *vox Dei.*

Candidates for a Hunger Strike

The English suffragets are waxing crazier and crazier. They have blown up Lloyd George's summer home, and threaten even worse outrages. They are cultivating a very dangerous mob-madness. All England is in terror of attacks on the King and his family and all sorts of crimes perpetrated on the plea of justice to women. Mrs. Pankhurst and her vixen daughter as leaders threaten fire and dynamite as well as hammer and stones, and express wonder that they have thus far used such mild measures. They need to be secluded from public mischief.

To be sure, they threaten that if imprisoned they will indulge themselves in the hunger-strike. But there is one way to get over that—they can be expatriated to some country, like Finland, where female suffrage is already achieved, or to New Zealand, where they can be permanently detained, and not allowed to escape. It is a monomania; they seem to be crazy on no other subject; and if in a land where there is nothing to excite their mania it may be that they will recover their reason. Or, possibly, there may be some spacious buildings and enclosed grounds in England or Scotland, or the Orkneys, or some sanitarium for lunatics, where they could roam about as if not in prison, and where food would be within reach, and where they would be tempted, even under a hunger-strike, to pick up food "unbeknownst" to themselves.

The Canadian Battleships

There may be a considerable admixture of party politics in the long-drawn-out debate at Ottawa which began on March 3 over Mr. Borden's policy of contributing three battleships to the British navy. The Liberal opposition is, nevertheless, acting under the conviction that this policy is being put thru Parliament against the will of the majority of the Canadian people. The reasoning and arguments of the Liberals are practically unanswerable, and the Government majority is meeting them merely with silence, or with perfunctory speeches without any spark of enthusiasm or conviction.

The Borden Government came into power in September, 1911, as a result of a general election held on the question of reciprocity with the United States—an election which, by the way, was forced upon the country by obstructive tactics in Parliament employed by the Conservatives to block the reciprocity bill. It was then understood that there would be a referendum on the navy question before any policy should be adopted, the only naval policy hitherto discussed having been Sir Wilfrid Laurier's plan of forming a Canadian navy, to be owned, manned and operated by Canadians. Mr. Borden's plan of a cash contribution to be spent on warships built in Great Britain and handed over absolutely to the British Admiralty had never been heard of, and the policy in many respects runs counter to Canadian ideals and traditions, and to the growing self-consciousness of Canada as a nation. In 1896, the change of government from Conservative to Liberal was preceded by systematic obstruction in Parliament. The House of Commons sat continuously for a week debating the Manitoba school bill, which was designed to coerce Manitoba into supporting Roman Catholic schools with public money. The Liberals were in

power from 1896 to 1911, when Conservative obstruction forced on a general election, and these two precedents may again be followed in 1913 —obstruction forcing a general election, and this followed by a change in government.

In Praise of Reading

Said old Royer-Collard to young Alfred de Vigny: "I don't read any more: I reread." Frederic Harrison quotes these words, confesses that he, too, has reacht "that tranquil time of life," but gives us no such impression of petrification. True, he tells us that hard workers, and even versatile writers, in their prime, *use* books, *refer* to books, more often than they read them from cover to cover. Yet in the very volume we are quoting, *Among My Books,* there is plenty of evidence that Positivism's Grand Old Man has read widely and well.

"How I pity the restless people who want the last book out," Mr. Harrison exclaims of those who worry till they can get sight of some ephemeral tale that they will forget the very name of tomorrow. "These Danaids are for ever doomed to fill their little pitchers with a stream of printer's ink which runs out at the bottom, and a dull and unwholesome fluid it is." We do not agree with all the critical opinions exprest in Frederic Harrison's chat *Among My Books,* but this supplement to his earlier *Autobiographic Memoirs* would deserve general attention if only for a single paragraph exhorting those who rush after new books *as* new books to turn toward the literature that is almost always at hand in half a dozen editions, new and old:

> What pure drafts, fresh from the Pierian spring, are all the while at hand, if they would but open the poor old standard books, as they call them, of which they know nothing but the name. These prodigals are fain to fill themselves with husks that the swine eat, when they should arise and go home to sup off fatted calf.

As a guide to some of the best slices of this Fatted Calf, books out of several literatures, in the original and in English translation, Mr. Harrison's essays will be valued highly by those who seek direction on the road to wisdom.

In Brief

The Isle of Pines is Cuban territory, an island close to Cuba on the south which is occupied almost wholly by Americans. When we recognized Cuban independence, instead of holding the island as we did Porto Rico, and as we might properly have done, the people of the Isle of Pines begged us to retain it as American, but we decided that it properly belonged to Cuba. Now they again ask us to negotiate for its acquisition, and we don't wonder that they do so. No great patriotism can be developed by belonging to Cuba. But this request is bitterly resented in Cuba, and the demand is made that the Cuban Government should treat the petitioners as guilty of treason. We understand treason to mean the making of war against the established government, which they have not done. We cannot imagine that if people in Maine or Michigan should request that those States be annext to Canada any one would call it treason. At worst it would be unpatriotic.

Fifty years ago Joseph E. Roy, D.D., was the weekly correspondent from Chicago of THE INDEPENDENT. Fifty years ago he and Dr. G. S. F. Savage organized the Congregational Church of Oak Park, Ill., then a hopeful suburb of Chicago, now itself a city. There were but three members of the new church, of four different denominations, and the council that recognized the new church consisted of but the two members, Dr. Roy and Dr. Savage. The church now has a thousand members, under the pastorate of Dr. William E. Barton. Dr. Savage still lives, but Dr. Roy died six years ago. The fiftieth anniversary of the church just celebrated gave the record of many daughter churches and of wide service for education and religion in which the present pastor has borne a distinguished part.

They do things better in France. Why in Italy should the King and his Cabinet meddle with the Pope's appointment of an archbishop for Genoa? The Pope appointed Mgr. Caron, but when he went to take the office and residence the civil powers refused to give him the *exequatur,* with the palace and subvention attached to the office. The Pontiff might have then submitted another appointment which the Government might accept, but he would not. Neither side would yield. Then a Genoese deputation visited Rome and promised to provide a house

and salary for Mgr. Caron if the Pope would allow it; but he refused because it would tend to increase the tension between Church and State. Better, as in France and here, keep the two separate.

The President's statement, issued for thoughtful reading in a few republics north and south of the Isthmus, ought not to alarm those republics, but it ought to warn them that, while we do not wish to meddle with their internal affairs, their maintenance of peaceful governments is a matter of much interest to us. What they need is to have a good electoral system and then obey the voice of the people and support the officers elected. There is no threat in the President's language or meaning; and yet Mexico and Nicaragua and Cuba should remember that it is to their advantage, and ours, that they keep the peace.

We do not pretend to know whether President Wilson will banish wine from his official dinners. It is reported that he is inclined to do so, as did President Hayes. A possible solution would be for him to exclude wine except in the case of invitations to representatives of foreign countries, who would be offended and annoyed by not being allowed their usual beverage. That would be a special courtesy to them, and is a concession that might be made, inasmuch as the drinking of wine is not a sin in itself, while the exclusion of it from other banquets would emphasize the principle.

When such men as Joseph H. Choate, Andrew D. White, Oscar S. Straus, Charlemagne Tower, all diplomatists, and Charles W. Eliot and Nicholas Murray Butler, university president, and Elihu Root, Cleveland H. Dodge, Robert S. Woodward and Henry S. Pritchett sign the appeal to the people in the name of the Carnegie Peace Endowment, for the prompt repeal of the Canal Tolls law, it is as if the conscience of the country had spoken. Let President Wilson and Secretary Bryan listen; let Congress obey.

The Jews are strong and rich, and every one is ready to defend them in Congress or in subordinate legislatures from insult; witness the denouncing of the treaty with Russia. We presume, therefore, that the bill before the New York Legislature forbidding hotels to advertise discrimination against guests on account of race, religion or color will be enacted. The specification of color could not easily be omitted, and it is justly included; and it is in the spirit of the Fourteenth Amendment to the Constitution.

It was a very positive and definite warning which Secretary Bryan sent to Cuba, telling its President that the act past by the Cuban Legislature freeing all prisoners ought not to be confirmed by him. Accordingly he vetoed it. Secretary Bryan's notice was not a piece of bullying of a weak nation, but was a kindly act, for the protection and peace of the island. The second thought of Cuba is so interpreting it. It might save us from being compelled by disturbances to end autonomy by annexing the island.

Germany balks at the increase of the army at the expense by immediate tax of $250,000,000, with a recurring tax of $50,000,000 more. Saxony leads the opposition, with the Bourse and banks in a panic over the matter. Meanwhile in France there has arisen a similar opposition to the new imposition of both taxes and time of service, the universities joining with the Socialists. We may hope that it may prove this time that the war demons have overreached themselves.

We should not get up a condition of fright if a sporadic case of leprosy occurs. The English health authorities have refused to provide a separate hospital for lepers on the ground that leprosy is contagious only in a low degree, and that intimate contact is necessary to permit the spread of infection. One sisterhood has had charge of a leper colony for fifty years, and no sister has ever contracted the disease.

Archbishop Messmer addrest the other day the Catholic students of the University of Wisconsin on the encyclical against Modernism. He made the interesting statement that Modernism is not spreading. "It is," said he, "a negligible element in the Church; it cuts no figure in the councils of the Church, nor is it likely ever again to need attention." The archbishop must be an optimist.

We have said, and still believe, that the United States ought before this time to have recognized the new republic of China. It is intimated that as soon as the elected Chinese Parliament meets in a few days, the United States will make haste to recognize China as possessing a stable government. The sooner the better, for China needs and deserves our full sympathy.

The extraordinary discovery of a chamber in the body of the Sphinx was not made by Dr. Reisner, of Harvard University, but by some newspaper reporter in the body of his own imagination. There is not the slightest foundation for the story.

A Pension System for Public Schools

By Henry S. Pritchett, LL.D., Ph.D.

[Now that retired college professors and presidents are provided with pensions by the Carnegie Foundation for the Advancement of Teaching, the question inevitably arises why cannot similar provision be made for the teachers in the public schools, who deserve it quite as much and need it even more. Dr. Pritchett, who as president of the Foundation has had more experience than anyone else in the administration of such a system, here discusses the desirability of pensions for school teachers and outlines a feasible plan for state action. A fuller discussion of this important subject will be found in the forthcoming annual report of the Carnegie Foundation.—EDITOR.]

Our educational problem is one problem, and if there is a justification for pensions for teachers in the colleges, there is a still stronger justification for pensions for teachers in public schools, where salaries are lower, work is harder, and the conditions of service are in every way more difficult. One of the great weaknesses of our public school system today lies in the fact that only a small number of men can be induced to undertake permanent careers in it. Before we can hope for the best results in education, we must make a career for an ambitious man possible in the public schools. To do this, dignity and security must be given to the teacher's calling, and probably no one step could be taken which will be more influential in inducing able men and women to adopt the profession of the teacher in the public schools than to attach to that vocation the security which a pension brings.

This problem is now before the legislatures of many states. It is going to be an increasingly insistent question. In the presence of such suggested legislation, the thoughtful legislator will wish to ask at least four questions: (1) Upon what grounds are pensions for public school teachers justified? (2) Assuming that pensions ought to be paid, who ought to pay them? (3) What form of pension system would it be fair to adopt, having regard both to the individual teacher and to the state? (4) What will such a pension system cost the individual teacher and what will it cost the state?

When these four questions have been answered, a feasible pension system for the public school teachers of a state will have been described.

While it is not possible to answer these finally for a particular state without a thorogoing examination of the salaries, ages, and lengths of service of the teachers who compose the system, it is nevertheless possible to give a general answer, sufficient to guide the inquirer in forming a judgment. The literature of the subject is extensive, both in English and in German, and the experience already gained has demonstrated certain fundamental principles which may be considered as settled. I venture, therefore, to outline the following answers to these four questions in the light of the experience of existing pension systems in this country, in England, and on the Continent of Europe.

1. Pensions are justified upon practically two grounds: first, those of a larger social justice; secondly, as a necessary condition to an efficient public school system.

The first of these reasons applies in marked measure to pensions like that of the teacher. Society, as at present organized, desires to get the best service it can out of the various vocations and callings into which men are naturally distributed. In some of these callings great prizes are to be won, and these serve as incentives for high performance. In other callings, like that of the teacher, there are no large prizes in the way of pecuniary reward (it would be a wise thing in society to create such). Society desires to obtain of the teacher a service quite out of proportion to the pay which he receives. Intelligence, devotion, high character—all are necessary, and the state seeks to obtain them at an average salary of $500 a year. It is clear that, if the state is to receive such

service, some protection for old age and disability must be had, if the best men and women are to be induced to enter upon such a calling as a life work.

Secondly, from the standpoint of efficiency in organization, whether a governmental one or a business one, there must be some means for retiring, decently and justly, wornout servants. In the past we have in most cases turned out men and women no longer able to teach, but the conscience of our time does not permit such action. Outworn teachers remain to the direct injury of the pupils themselves. As a matter of efficiency, some humane method of retirement for public school teachers is necessary.

These two reasons for the establishment of pensions for the teachers in state schools are sound and unanswerable.

2. Three plans for securing protection against disability and the weakness of old age are proposed: a pension system borne wholly by the employer, a pension system borne wholly by the employee, a pension system conducted jointly by both employer and employee and supported by their joint contributions.

While there are some variations of opinion among those who have studied the question, the overwhelming weight of opinion is in favor of the third plan.

A pension system resting upon the contributions of the employer alone has many objections, not the least being the lack of cooperation and of the incentive to thrift which are likely to be produced by it.

A system of pensions depending on the contributions of employees alone amounts practically to a compulsory system of saving. In order that the benefits may be large enough to form a basis for retirement, the contribution must be so large as to be practically prohibitory.

The third plan seems to me justified not only on the ground of equity, but upon the ground of self-interest, whether the employer be a corporation or a government. All salaries such as teachers' are relatively low, and while the question of a just salary must not be confused with the equity involved in a relief plan, it nevertheless remains true that the general equities of service demand that a part of the pension of a servant be borne by the employer. A state still owes to the faithful teacher something after it has paid his salary. He has been required to regulate his life in large measure for the common interest. In addition the employer, whether a corporation or a state, secures a higher efficiency by a well-ordered pension system. Finally, only by such joint action can be secured the right cooperation between employer and employee. On all three grounds — the ground of general equity, of increased efficiency, of a better social cooperation—it is desirable that a system of pensions rest upon the joint contribution of the employer and the employee.

I assume that on the whole it is fair for the teacher to bear half the cost of the annuity and the state the other half.

3. The form of pension system at once just and feasible would involve the consideration of many details, but at least these general principles may be assumed as proven:

(*a*) The pension obligation should be compulsory upon every teacher who enters the service.

(*b*) The amount of the contribution should be determined by thoro actuarial investigation, but each teacher shall form a unit, and the annuity which he is to receive shall be based upon his own payment plus that granted by the state. Such an arrangement is just and fair, and is capable of actuarial computation. Every individual, whether he survives, resigns, or dies, thus furnishes the basis for the action taken in the particular case.

(*c*) Contributions levied upon teachers who resign or are dismissed must be returned with a moderate interest—say 3 per cent—and similar returns must be made to the widows or heirs of those who die.

(*d*) A central administration for the pensions of all public school teachers should be provided, constituted of a small commission serving without salary, with a paid executive who should at the same time be a competent actuary.

4. The cost of such a pension system to the state or to the individual can be approximated only after some assumption is made as to the amount of the pension to be paid in the individual case. In order to arrive at some estimate, I assume that the teacher is to receive a pension of 50 per cent of his pay at the time of retirement, one-half of the pension to be provided by his own payments, the other half by appropriations from the state treasury. Thus, a teacher in the grammar school who receives $500 a year, which is somewhat higher than the average, would be paid at the assumed age of retirement—say, sixty years—a pension of $250, of which his own contributions must furnish an amount sufficient to supply an annuity of $125, and the state the remaining annuity of $125. The teacher who enters at twenty-five would need to pay, in order to provide his annuity at sixty, about 3 1-2 per cent of his salary—in other words, something less than $20 a year, which, compounded at 4 per cent, would take care of his half of the annuity. Should the teacher die or resign in the interval, the state would repay his accumulations with interest at 3 per cent, a process which ought to furnish a small profit, but which, on the other hand, gives to the teacher's family a protection which is most important and most needed. On the whole, therefore, for a pension system which aims simply to retire individuals at sixty, the teacher must expect to pay a proportion of his salary amounting to 3 1-2 to 6 per cent, according to the age at which he enters.

Assuming a school system comparable with that of, let us say, the State of Kansas, or the State of Virginia, or the State of Iowa, with approximately 12,000 school teachers, how much would such a system cost the state? And what rules should be inaugurated at the start which may be at once consistent with the security of those who contribute and with the dignity and honor of the state? for when once the state accepts the contributions of these teachers and enters into a contractual relation with them, it cannot insert into the provisions of its pension system a clause reserving the right to amend the conditions at will. Assuming a constituency of public school teachers of a state to number 12,000, and that they receive an average salary of $500, what would the system ultimately cost the state, if it paid one-half of the pensions which might accrue under such a simple pension scheme as I have assumed, namely, a pension system which retired teachers at sixty years of age upon half-pay, the teacher providing one-half of the pension?

This question is the hardest of all to answer. The wisest actuary can make only a guess. The chief uncertainty arises out of the fact that comparatively few teachers remain permanently in service to the age of sixty. At present the great bulk of teachers are women. Many of these marry. Others, for one reason or another, drop out of teaching. The number who take their calling seriously and who will persist to the end of their active life is, of course, increasing, but any estimate as to the number who will ultimately earn pensions under such a plan is subject to large error.

In Virginia, for example, the men teachers in the calling at the age of sixty form about 5 per cent of those who started; if there had been no retirements, they would be about 60 per cent. Similarly for women teachers, those at the age of sixty form about 16 per cent of those who started, while had all persisted to the age of sixty except those removed by death, the percentage would be 67. As the women teachers far outnumber the men, it may be said roughly that the fluctuations lie between 15 per cent at the present time and a possible 65 per cent. The statistics for Illinois are quite near these. Perhaps the assumption of 40 per cent, the arithmetical mean of these two limits, would be as close an approximation to the facts a generation hence as could be made. Such a

school system of 12,000 teachers at an average of $500 and paying pensions on the basis assumed would, therefore, develop a charge upon the state treasury of $600,000 a year, which is 10 per cent of the salary cost, and which probably represents approximately the maximum load which a state like Kansas or Iowa would in the course of a generation assume in adopting such a system. This load would, of course, be greatly reduced by advancing the age of retirement from sixty to sixty-five.

The form of pension system here assumed is the simplest possible. It provides a pension in but one case, namely, that of the individual who has come to the age of sixty. It does nothing for the teacher who has become disabled at an earlier period, or for the families of those who died. Such a provision would, however, take care of that main load which affects both the question of justice and the question of efficiency, and would go far to solve the wants which a pension system can meet. It will be wise, in my judgment, for such systems to be formed upon very simple lines, and not to attempt to meet every individual case, but to provide justly for the one or two great sources of need which appeal both to our sense of justice and to our ideals of efficiency.

There is one modification of this simple scheme which would add little to the expense, but which would cover practically all that a pension system for public school teachers should at this time attempt to do, that is, the payment of a proportionate pension for a given length of service in case of disability. For example, a state might well afford to pay, after fifteen years of service and of contribution, an agreed upon proportionate pension to the teacher who had broken down in its service.

These general principles will, I believe, be found to cover the essentials of a state-wide pension system for public school teachers. Such pensions undoubtedly are to be paid. Both our sense of justice and our ideals of efficiency demand it. The danger is that they will be begun under unwise and imperfect conceptions, which ultimately will defeat, or at least retard, as was the case in New South Wales, the whole movement. The one word which needs to be spoken to any association of teachers and to any body of legislators who are to deal with the question is, to take no step without sound actuarial advice, and to make use of the rich experience of the past which is now available.

As pension systems become numerous it will be desirable to arrange some equitable plan for the reciprocal exchange of contributions and liabilities, so that a teacher, transferring from a school under one pension system to a school under another system, will not lose the accumulated right to a provision in old age.

In the minds of many there will still remain the question whether, in the light of what the Federal Congress has done in the matter of Civil War pensions, any state government can be trusted to control such a relief system, free of politics. The Commission on Economy and Efficiency appointed by President Taft recommended as a plan of retirement for civil employees of the Federal Government a system of annuities supported from the contributions of employees alone, based upon the age of entrance into the service; the maximum annuity to be $600. The Government is to provide for the accrued liabilities in excess of 8 per cent of the employee's salary, and to guarantee 4 per cent upon the contributions of the employees. The system will apply to government employees in the District of Columbia only. The plan, which has been worked out in most complete actuarial form by Herbert D. Brown, of the Department of Commerce and Labor, contemplates the return to an employee leaving the service prior to the age of retirement of all contributions with interest at 4 per cent compounded annually, and the return to the legal representatives of an employee dying either before or after retirement of the amount in hand not yet paid out to him in annuities, with in-

terest. The retiring age is seventy. This plan is really not a relief plan, but a system of compulsory saving. The commission was evidently strongly influenced in its conclusions by the fear that any pension system administered by Congress which involved a payment by the Government of even part of a retiring allowance would be subject to political abuse. No one familiar with the history of Civil War pensions can doubt the possibility of such a misuse of public money. The Civil War pension history constitutes our greatest political scandal. To Congress and to the country it has been a source of untold demoralization, and the Presidents of the United States share with Congress the responsibility for this legislation.

Will a state legislature and a state governor administer justly a matter in which the general government and the chief executives have been so weak?

In answer to this it may be said that a pension system in which the employee contributes does not present the same opportunity for political exploitation that the Civil War pensions have presented. The man who believes in the future of his country and in democratic progress will be slow to admit that either Congress or the state governments will be found permanently incapable of carrying out so simple an obligation. If our democracy cannot learn from such an experience as that of the Civil War pensions, it is helpless to solve the problems that confront it on every hand. In any event, the argument that our government is not honest enough to conduct a justly planned relief system for its employees is a weak reason for inaugurating an unsatisfactory system.

Resurrection

By Zitella Cocke

So beautiful the flower that grew
  Beneath my window ledge,
It crowned with glory the bright scene
Of growing grasses glossy green,
  Down to the garden hedge.

No flower methought e'er bloomed so fair,
  Or showed such winsome grace;
The butterfly, in hushed delight,
The bird and bee, paused in their flight
  To gaze upon its face.

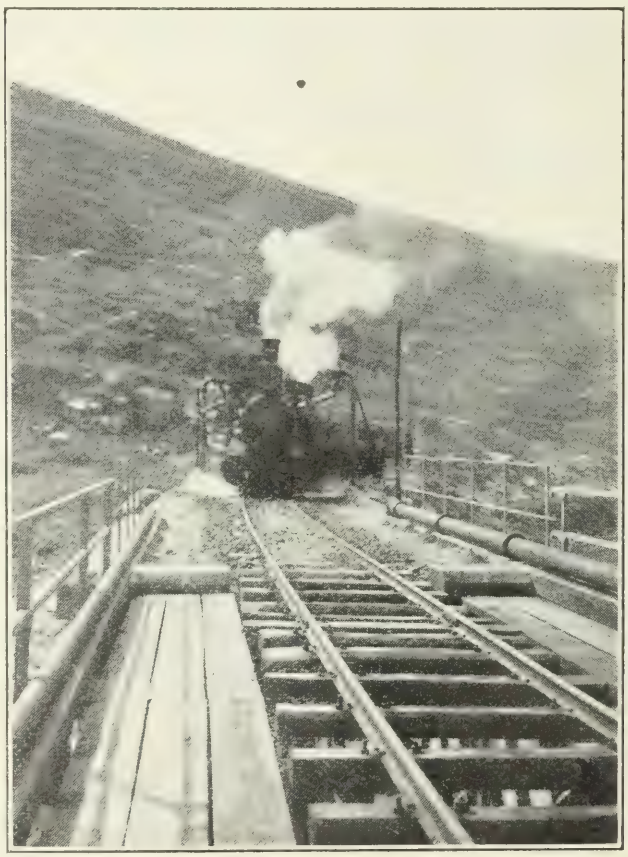
Alas! how craftily it comes,
  The autumn's blighting breath;
'Twas but a night, and, aye—to root
Lay flower, and stem, and leafy shoot
  In icy grasp of death!

Yet, scarce had spring's rare radiance
  Enwrapt the pulsing earth,
When lo! a wonder beautiful,
My flower sprang forth,—a miracle
  Of glorious new-birth!

And shall Death nurse to Life the flower
  So weak,—so small of scope,—
Or Life pierce thru the stubborn sod
To clothe the rough and uncouth clod
  And disappoint man's hope?

Nay; Nature gives the lie to Doubt.
  Her Resurrection cry
Bursts wide the humblest flow'ret's prison
And calls to Faith: "The Lord is risen
  And Man shall never die!"

Boston, Mass.



PALESTINE AMERICANIZED

by Clifton Harby Levy

It seems as if the oldest land known to civilized man is now to be brought under the influences of the newest of the world's great nations. American influences are being brought to bear in the attempt at the transformation of the Holy Land into a prosperous, healthful and self-supporting country.

On January 17 Mr. Nathan Straus and a party which included two trained nurses sailed for Palestine to aid in the work of introducing modern sanitary methods into Jerusalem and the country at large. This is to supplement the work already begun by the establishment of a central "board of health," under the charge of Dr. Brunn, a young graduate of the University of Berlin, who is trying to introduce modern sanitary ideas into this laggard land. But more than one institution will be required and many more than two nurses will have to go to Palestine before there can be much hope of convincing the ignorant natives of the necessity of cleanliness and anything like civilized modes of living.

THE JAFFA AND JERUSALEM RAILWAY
"There appeared a chariot of fire and horses of fire."
—2 Kings 2:11.

Broader and already more or less fruitful work has been done along mechanical and agricultural lines. The introduction of American machinery and ideas is revolutionary indeed, but it goes on apace. It is difficult for progress to be restrained where the railway has entered, and the Jaffa to Jerusalem railroad has been the great prophet of

MOTORING ON THE DEAD SEA
"No galley with oars, neither a gallant ship."—Isaiah 33:21.

the new era. Since its opening a new day has dawned for Palestine, but many influences have been necessary to direct the efforts of the friends of the Holy Land along American lines.

There can be little doubt that the agitation for Zionism has had no small part in this work, for it has meant not only the directing of considerable immigration toward this country, but the accumulation of large funds both in Europe and America, which have constituted the sinews, not of war, but of the modernization of the land and the methods of cultivating it.

The primitive plow has been set aside for the American cultivator; the awkward carts have given place to American buggies, and the ancient mode of garnering the grain and threshing it has been replaced by the up-to-date American harvester and thresher.

The ignorant fellahin stop and stare indeed to see the monster machines sweeping thru the fields and gathering in a day what required weeks under the old regime. They are in no hurry to adopt the newer methods, but astonishment is only a first step in education, and after wonder naturally follows imitation, when the results are proved as satisfactory as can here be shown. The Jewish Agricultural School near Jaffa is demonstrating the value of American agricultural machinery and methods, and its graduates will carry the message all thru the land and even beyond the Jordan to that great land which once yielded wheat for surrounding millions. The German colony of Wilhelmina, near Jaffa, is also a splendid

STEAM THRESHING ON THE PLAINS OF SHARON

From a photograph by the American Colony.

CLIMBING MOUNT ZION

A ten-ton road-making machine from Chicago entering the Jaffa gate of Jerusalem. "Cast up, cast up the highway."—Isaiah 62:10.

object lesson in thrift and modernity, which the natives must learn to imitate sooner or later.

Even the roads around Jerusalem are being built with the help of an American ten-ton machine, made in Chicago. It may be seen in the photograph, as it ascends Mount Zion to enter the city at the Jaffa Gate, moving by its own power. The American and Turkish flags on the machine indicate, more than a column of type could, the strange juxtaposition of the ancient and the modern, as typified by this new movement in Palestine.

It may seem incongruous indeed to behold an American motor-boat plowing the heavy waters of the Dead Sea, but this, too, may be seen. The spirit of modernism as typified by the American, and especially by his time- and labor-saving machinery, is wrestling with the ancient sloth and lethargy of the Turk, and the outcome of the struggle cannot be doubtful. Jerusalem and Palestine, much as some might like to have them preserve their ancient character, are in process of transformation, and those who would see the Holy Land as it has been these two thousand years or more must hasten their steps, or they will find an entirely different country than their books have told them about.

It may seem almost desecration to some, but the spirit of American sport has made its way thither, and is showing itself in very striking ways. At the head of this article, for instance, is a photograph of a football game just outside the walls of Jerusalem. The Beirut American College team is playing a match game against an English Jerusalem school team, while the monuments of the ages look down upon them from the distance.

Thus the spirit of Americanization is making its way into Palestine by every possible avenue. Mr. Straus and others interested in the health of the people are trying to convert them to cleanliness; the agricultural schools and colonies are teaching year by year how to cultivate their fields and gather their crops most perfectly; and all thru the land the new spirit of enterprise is making itself felt, even in the games which the boys are playing.

The discovery of wild wheat, made not long since by Dr. Aaron Aaronsohn, has aroused great interest in the wheat-producing powers of the land, and there is no reason save the dulness and retrogressiveness of the natives, that Palestine may not again produce grain and fruits in abundance. The country requires irrigation, a thrifty population, and modern methods and machinery. It seems now as if America is about to provide just what is needed to bring back at least a modicum of the prosperity which the Land of Promise once enjoyed. More wonderful things than this have been accomplished by American inventiveness and enterprise, and when there is coupled with this the devotion manifested by many thousands to the Canaan of their ancestors, the outcome is not a matter of conjecture.

So, if you would really see the old Palestine, and be able to recognize it, do not wait, for in a few years more it will be so altered that Moses himself would not know it, for it will be completely modernized — Americanized.

Fire Waste

What the Public Can and Ought to Do to Prevent It

By John M. Bessey

[From his experience in the Wisconsin Insurance Department and as special assistant to the Wisconsin Legislative Fire Insurance Investigating Committee, as well as from his study of the economics of insurance in the graduate school of the University of Wisconsin, the author is well qualified to discuss this important topic of fire prevention.—EDITOR.]

A distinguished German mayor, while visiting on this side of the Atlantic, was one day taken into a certain city fire-fighting station to witness a crack company's response to an alarm. His studious eyes sparkled with admiration as he noted the spotless walls and floor, the polished brass and nickel apparatus, the splendid and costly equipment, the resolute character of the company's captain, and the strong, intelligent faces of the men. The thoroness and discipline of the place made a warm appeal to his German love of order. He was in the act of expressing his delight to the captain of the company when the gong sounded. The captain cut off the latter half of a modest word of thanks, threw one glance at the ticker, bounded into his already moving car and was away! Every man had stopped where he was, pulled off his coat and hat and jumped into his place! Motors began to pound! The heavy trucks tore out of the house and down the street! In six seconds the place was cleared!

The German gentleman was much imprest, almost enthusiastic. "It is marvelous!" he exclaimed. "How you Americans love to do things well!" And he went on to commend the generous foresight and public spirit of the American people which prompted them to employ their great wealth to such good purpose. We have evidence that this expression of the distinguished visitor's was sincere, for he had been in this country but a few hours. But we also have evidence that this judgment of his received a severe jolt when he became acquainted with the true state of affairs.

To his great bewilderment he found out that most of the largest and costliest buildings in the city were not fireproof; that insufficiently protected stores, shops and factories were full of people; that many buildings were much higher than the width of the street on which they stood; that these contained wooden floors, long wooden stairways, open elevator shafts and flimsy skylights; that most buildings were protected from exposure only by hundreds of thin glass and wooden frame windows, and that the only escape to safety was out of these windows and down innumerable flights of break-neck fire-escapes; that thousands of children were daily assembled in school buildings of frail and combustible construction; that frame houses with dry shingle roofs stood in rows and rows over acres and acres, mingled with sheds, barns and old board fences; that the city was not segregated by long lines of fireproof buildings into small "conflagration districts," and, to top it off, that this condition of public recklessness and indifference which, by the grim law of probability, would some day lay the whole city in ashes, was unconsciously being copied by thousands of people in their homes. We have evidence that our German friend was considerably shaken in his opinion that we were a people of great public spirit; in fact, as he was leaving for the Fatherland he was heard to say: "The Americans are mad!"

Europe regards the destruction of property by fire as a crime; America, as a misfortune. Europe's dense population has had to study the conservation of property; America does not yet think about it. Europe thinks, We must be economical, for waste

raises the cost of living; America says, We have plenty—why should we care? It is for this reason that houses in Europe are built to live in; and that houses in America are built to sell.

Fire waste is a crime. Wealth is not so plentiful even in these rich and prosperous United States that we can afford to pay $800,000,000 a year for the jolly fun of seeing the chariot race of fire engines go by. Expensive melodrama, this $800,000,000 a year! It is the great American fire tax, which insinuates into the family budget of the average American householder some $40 to $45 per annum.

"Nonsense!" explodes the average American householder. "I never pay any fire tax. Do you mean insurance? Ha! ha! I don't own any property. My landlord pays that."

But he pays it nevertheless. He pays the insurance in the rent. He pays for the city's heavy fire protection in the rent. He pays for the enormous American fire waste in everything he and his family eat, wear or use. The clothes on his back, the bread on the table, the coal in the bin, the oil in his lamps, the furniture, the books, the daily news, his water-rate, his street-car fare; everything he consumes or enjoys he pays for, and with it he pays this special fire tax.

There is a byword among fire department chiefs, fire marshals and insurance men that one-half the fire loss is due to carelessness. This, perhaps, describes the actual state of affairs a little too mildly, for numerous investigations of the causes of fires would tend to show that the price of carelessness is even higher. Our annual fire waste is in the neighborhood of $450,000,000, meaning that fully a quarter of a billion dollars a year is our penalty for carelessness. Oh, the poorly built and neglected chimneys! the shiftless wiring! the ubiquitous parlor match! the abandoned bonfire! the lazy men and women with the gasolene can! the convenient and deadly oil lamp! the rubbish heaps in cellars and attics! the overheated furnaces! the unguarded smokestacks! and the two-legged fiends with radio-active cigaret and promiscuous cigar stub!

Most people never have a fire. This is equivalent to saying that most people are careful. Smith and Jones and Brown and Harris and Tubbs and Williams and Chandler are in the habit of taking a little thought concerning the security of the little domain over which each one of them reigns more or less supreme. They will not live in a house unless they know that the chimney flues and furnace pipes are *not* defective. They take care to keep their matches where the children cannot reach them. They place their lamps where they cannot be knocked over. Rubbish is not allowed to accumulate in their cellars or attics or shops. They are careful men, and for that reason are in no way accountable for that quarter of a billion dollars a year of careless fire waste. But Felcher!—vile, lukewarm servant of the commonweal—he is in the shiftless habit of lighting his morning fire with the help of a kerosene oil can. He does it every morning for a year, for two years, for five years, and nothing happens. But one morning there is a blinding flash; Felcher's house goes up in flame and smoke. Smith, Jones, Brown, Harris, Tubbs, Williams, and Chandler come running over, and work like stevedores in the dirt and flame and smoke to help him save what they can. Then they contribute food and clothes and lodging to Felcher for his wife and children. And they congratulate him that he is insured! Fools! Who pays for his insurance?

Instead of proceeding against Felcher in a criminal action they help him build a new home. They do not think that it is the premiums they have paid which build Felcher's new house. They do not know that, if it were not for the carelessness of Felcher and others of his ilk, the premiums they have to pay would be only half so high. If every fire is a

crime, then every fire due to negligence is a double crime. Why should Smith and the others bear the burden of Felcher's negligence? They ought to rise in the might of their majority and demand of him a recompense for the diligence and sacrifice on their part which enabled him to rebuild his house. They should punish him with a severe fine. The least they could do would be to make an agreement with him something to this effect: You, Felcher, must pay a premium in proportion to your hazard, and we, Smith, etc., will then be relieved of paying that 50 per cent excess rate which we now pay because of your carelessness; and henceforth, if it pleases you, you may light your morning fire with kerosene oil as often as you wish; provided, of course, that the sparks from your next experiment with the theory of probabilities will not endanger our own homes.

There are better ways to inculcate a much-needed responsibility for the care of one's property than by the indirect and probably impracticable method of charging the careless man for his moral hazard. We go back again to Germany for a lesson on this point. "Germany!" some one shouts. "Let us have none of that deindividualizing paternalism!" We will not enter here into an argument as to whether the American or the German citizen enjoys greater personal liberty. We suggest that what is sometimes called "German paternalism" may be, after all, merely German docility and love of order. And obedience is never deindividualizing. This is how Germany handles the problem of individual responsibility for fires:

An American gentleman, temporarily living in Berlin, was awakened by smoke and found that a fire originating in a room above him was eating its way thru the ceiling of his dining room. The blaze was extinguished with chemical apparatus without any water damage and without needless destruction of walls and furniture. Meanwhile a careful investigation was made by officials, and the next morning the man who turned in the alarm was sent for and taken before a fire marshal with inquisitorial powers. The examination of all involved showed that the fire started in a hot coal which had dropt from a laundry stove in the attic and rolled upon an unprotected wooden floor. The tenant proved that the stove was an appointment of the building, provided by the landlord, and that it was neither his duty nor his privilege to change it. The landlord proved that he had recently purchased the building under the usual guarantee that all laws and ordinances had been complied with in construction and appointment, that this stove had not been changed, and that his attention had not been called to any condition involving a fire risk. The builder from whom the owner purchased was then called and had to admit that he was responsible for the setting of the stove as the police had found it, and that he had violated the law in neglecting to provide a suitable metallic hearth of the required kind and dimensions between it and the floor. This responsibility was brought home to him by an assessment against him of the damage to the furniture and property of the tenants, together with the estimated cost to the city of responding to the alarm and extinguishing the fire, rounded out by an exemplary fine of 500 marks as a reminder that German laws are intended to be observed. The builder was not required to pay for the damage to the building, it being held that while the owner had not committed the violation of law which caused the fire, he had been neglectful in not discovering and correcting it, and for that reason should pay for his own repairs. He was informed that only the fact that he had owned the building for a short time saved him from a fine in addition.*

This is how the Germans teach responsibility for fires and save their property from burning. It is not restraint upon the individual will, but a voluntary and sensible submission of that will for the public benefit. It is national self-control, not national insanity. Before they coöperate to insure their property against the risk of loss by fire the Germans cooperate to prevent the fire. In this way they save every year the great portion of that $45 which we in America lose. Be it said, however, as a balm to the slighted spirit of American enterprise, that the excellent German system was not entirely due to German

*Bulletin No. 58, Bureau of Publicity and Education, Chicago.

initiative. Germany is a huge family; there are many mouths to be fed; wealth has its sharp limitations. Economic development in Germany long ago reached the point where savings had to come thru coöperation and by greater economy. In spite of high rents and scarcity of land, the German outlay for public parks, playgrounds, school-yards and forests puts our American municipalities to shame. German schools, churches, libraries, museums, art galleries and other public buildings are the best and finest in the world. Such are the savings of a poor but economical people. Our American fire waste would pay for 1,000,000 acres of land at $450 per acre every year. To 1000 American cities, 1000 acres each! Two or three years' saving of the fire waste would turn every acre of it into a beautiful park! But the money which would buy these things is now an absolute loss.

We have this hopeful sign: our good citizens are beginning to be alarmed at this enormous and criminal prodigality; $450,000,000 a year! We find that we need that money badly; that it must be saved. To prevent the destruction of our property by fire is as great an economic problem as to conserve our natural resources. There is a very active national society now engaged in the study of this subject; it publishes its findings in a quarterly magazine; it works out rules and standards of safety, and draws up model laws and ordinances for the protection of life and property, and it conducts a continuous campaign of education and publicity in the science of fire prevention.* There are numerous State and local associations organized for the same purpose. Fire departments are being used to search out hazardous conditions and eradicate them before they can cause any trouble. Some cities have adopted comprehensive building codes. Not a little has been done by private enterprise, induced perhaps by considerations of a lower fire insurance rate. Bankers' and credit men's associations, building and loan societies, local mutual insurance companies, factory mutual insurance companies, civic clubs and coöperative leagues have begun to realize the tremendous saving that can be effected by taking a little thought concerning the conservation of building property and its contents.

Nothing exhibits so strikingly the needlessness of fire waste as a study of the causes of fires. In Germany every fire is carefully investigated, and this practice affords a very broad and very valuable statistical view of the problem. Most of our States employ a fire marshal whose duty is to investigate and report the causes of fires. Strange as at first blush it may seem, fire insurance companies are not primarily interested in the prevention of fires, on the plausible theory, we suppose, that their business is confined to the sale of indemnity; however, thru the National Board of Underwriters, fire insurance companies gather every year complete statistics of the causes of fires. The table below is a general classification of the causes of fires taken from the report of the Wisconsin State Fire Marshal for the year 1912:

Cause	Number of Fires	Per Cent of Total
Incendiary	61	3.2
Suspicious	49	2.6
Negligence	635	33.5
Defects	563	29.7
Exposure	297	15.7
Lightning	231	12.2
Spontaneous	58	3.1
Total	1894	100.0

The classification of causes in the report of the fire marshal was, of course, more detailed, but for the sake of convenience they can be legitimately grouped under the seven general heads given. It will be noticed that the general causes assigned range from deliberate and intentional arson to unforeseen circumstances like lightning and spontaneous combustion, in legal language fatalistically termed "the act of God." It will

*National Fire Protection Association, Boston, Mass.

also be noticed that the causes shade into each other. Sometimes it is hard to distinguish between incendiarism and negligence. In a certain sense, defects and exposure are really negligence. Most fires caused by lightning should properly be classified as due to exposure. The striking fact brought out by this classification is this: if negligence could be cured, and defects could be corrected, and all buildings could be made fire and lightning proof, 1726 of these 1894 fires would have been impossible; 91 per cent of the fires would have been avoided.

It requires so very little forethought and effort to make the occurrence of a fire impossible that our enormous fire waste can only be ascribed to selfishness or childish ignorance. We speak of fire prevention as tho it were some new science; perhaps we have still a great deal to learn. The perfection of standards of safety and protective apparatus and devices is a matter of constructive engineering, mechanics and chemistry, and presents no insurmountable difficulties. We *can* make our buildings fireproof; we *can* keep things from burning. But fire prevention must contemplate the protection of buildings as they now exist, and many of them are in a highly combustible condition. They are dangerous as fire breeders, but public opinion will not brook their arbitrary demolition or removal. The great difficulty in fire prevention is a matter of social psychology. How shall we transform the present national apathy and indifference to the fire waste into a love of economy and a zeal for order?

Negligence has long been our national vice. Prosperity has made us a prodigal people. The rewards of success are so great that, like the gambler, we pay no attention to the small losses. Yet the sum of these small losses is enormous. Moreover, the age of machinery has greatly increast the amount of investment for tools; the housing of those tools has become incidental. So the operator housed his costly machinery in a cheaper building, having found out that it was easier to get fire insurance than to get more money for a better constructed plant. The rise of the fire insurance business parallels the age of machinery. Fire insurance is the protection; it is a sort of legitimatized gamble; you pay so much, you invest your capital in combustible property, and if it burns you are indemnified. Fire insurance does not protect property; it relieves the individual of responsibility. The direct method is the prevention of fires. Fire insurance is indirect, costly, selfish and 90 per cent useless. Fire prevention is cheap, altruistic and 90 per cent effective.

There is no surer prophecy of the change in our national character than the growing public interest in the prevention of all forms of waste. Witness the great achievements in the prevention of disease! The development of scientific methods in manufacture, commerce and agriculture has resulted in such savings that we are greatly encouraged. The fire prevention principle is sound. Show the public how fire waste increases the cost of living and the public will begin to insist that there be no fire waste. If the people are eager for it, fire prevention is easy. We might begin by abolishing the parlor match and the shingle roof. We might limit the amount of recovery on a loss to three-fourths or four-fifths of the amount of damage—that is, make every insured person responsible for a fraction of his risk. The latter reform alone would place an effective premium upon negligence. City building codes and frequent inspections and thoro investigations of fires will help to eliminate the rest of the 90 per cent of useless blazes. Modern business has no greater and no more worthy task than the prevention of fires, and no task that promises such wonderful results.

If we could save 90 per cent of that $450,000,000 fire waste! What countless benefits such a stupendous sum would provide! We have suggested that the saving would be applied to the improvement of city and town life, for it follows that fire prevention

will have a broader and more permanent effect than the mere elimination of the fire waste. The spirit of thrift and coöperation which urges people to care for their property will also lead them to take thought for beauty. When a man begins to do things well he becomes an artist. And when the artistic sense has taken root, there is no forecasting what hights the developing richness and fullness of American community life may reach. A city that never has a fire! It means cleanliness and order, both public and private. It means a city of gardens, clean streets, noble buildings, beautiful parks—a city of thrift, economy, health, life and the highest kind of citizenship.

The Woman of Tomorrow

By Jean Finot

[M. Finot is editor of *La Revue* and author of several brilliant and original books, *The Philosophy of Longevity*, *The Science of Happiness* and *Race Prejudice*. The last, which was reviewed by H. G. Wells in THE INDEPENDENT of February 14, 1907, is designed to overthrow the ancient superstition that mankind is divided into distinct and immutable races, some of which are essentially inferior to others. The following article, *La Femme de Demain*, written for THE INDEPENDENT and translated by Alvan F. Sanborn, is directed against a similar evil, sex prejudice, which has caused and is causing almost as much trouble in the world as race prejudice. A further elaboration of his ideas on this subject will be found in *Préjugé et problème des Sexes*, of which fortunately a translation by Mary J. Safford, *Problems of the Sexes*, has just been published by Putnam.—EDITOR.]

In the struggle between the sexes which has endured ever since man and woman have been upon the earth, the signification of their interests has never been viewed save from a particular angle.

Men have always spoken from a masculine outlook; women have placed themselves exclusively upon the ground of their sex.

Now, above their recriminations and their aspirations is the future of humanity itself. And this is one of the reasons why the exceedingly voluminous works consecrated to the conflict of the two halves of the human species beat the air vainly, merely reiterating the same complaints and the same accusations.

The aspect of the question changes at once if, in reconciling the apparently antagonistic interests of the two sexes, we attempt to save those of humanity. When we have attained this hight we perceive before us new and unexpected horizons, and, first of all, the possibility of concord in reciprocal comprehension.

The march of humanity is not calculated to satisfy the dreams which the least exacting of its guides formulate. Between the ideal that presides over our destinies and reality abysses often intervene.

Today, as thousands of years ago, we are still living under the regime of brute force. Humanity is disunited and human beings do not evolve in accordance with the principles of neighborly love, the primordial basis of all the systems of ethics and of all the religions. Dull and ominous discontent is rumbling in the lower classes and threatens sooner or later to invade and to destroy the edifice that shelters us. There is a more and more profound and almost insurmountable antagonism between the rich and the poor. Civilization has made immense progress, no doubt, but the thorns of the rose appear more and more threatening and disquieting. Imagine a woman of radiant beauty who finds herself a prey to numerous maladies that imperil her very life. Alcoholism, the debasement of the race, the increase in the number of the insane, as in that of suicides, prove that there is something rotten in the social organization, in the world organization. Besides, another menace no less formidable weighs us down: namely, the discontent, constantly growing more intense, which separates the two sexes.

Social conciliation and happiness appear thus to be far removed from us. Humanity, fatigued by the route

it has followed during so many centuries, shows itself discouraged and disillusioned. We even question whether there is any moral progress whatsoever, and especially we doubt whether we have advanced in the domain of happiness. The splendor of discoveries realized no longer deceives us regarding the value of our lives. More and more we are coming to comprehend that the salvation of our souls is the essential condition of our happiness. Now our souls are terribly troubled; often they are even thoroly unhappy.

Reflecting upon the multiple reasons for this condition of affairs, we easily discern one of its dominant causes: it is the absence of solidarity between the two sexes, obliged to work together in behalf of progress and yet in a state of often visible, always latent, hostility. Wasting of forces and a profound bitterness, grounded in reciprocal misunderstanding, are the results.

How obviate this uneasiness?

If we consider the reciprocal relations of man and woman we are struck by this phenomenon:

Fed upon venerable prejudices, they almost deem themselves representatives of two different humanities. Not only does man look upon woman as an inferior being, but woman herself shares this way of seeing.

Everything woman has written about herself offers us, in this respect, some thoroly singular affirmations. The women with the most genius have never been able to regard themselves otherwise than as beneficent monsters. With touching unanimity they acknowledge that woman possesses neither a creative mind nor the critical mind whose activities verge on creation. Impulsive and impressionable, woman seems in her own sight a child whose intellectual and moral growth was arrested at a given moment.

What, then, can we expect of man who, nourished with the false ideas bequeathed him by the very founders of religions, has never been able to accommodate himself to the consoling fact that there is equality of value between the two sexes!

For the truth is that woman is capable of performing all the social and political tasks which are today in the domain of man's activity.

In almost all countries the woman of the old-time tradition has gone by. Woman has lost many of her former qualities and has gained new virtues. She has even contracted different habits and modes of thinking. They who deny this grand movement have only the intellectual professions in mind. Some hundreds of female doctors or lawyers shut from their view the millions of women who are working in industry, trade and agriculture. The detractors of woman bear a certain resemblance to the observer of whom the fabulist speaks, who, entering a zoological garden, perceived only insects, remaining blind to the lions or the elephants.

Against this revolution which is invading and dominating us we can do nothing. Woman's transformation proceeds from civilization itself and we have not the power to arrest it.

This modification of the life of woman involves in turn a change in her legal and moral status. Man makes a mistake in talking of the weakness of woman, after having obliged her to enter the industries which are the most unwholesome and the most dangerous to her health and

to that of future generations. For equal burdens there are equal rights. And man would make an equal mistake in trying to reassure himself with the thought that woman is, at any rate, inferior in respect of her gifts and of her qualities.

True, when we pass contemporaneous science in review,. we perceive that it is not indulgent toward woman. Biology and sociology, as well as ethics or psychology or physiology, deny her many qualities which they accord generously to man. But, if we examine their affirmations more closely, we find that we have to do only with ancient prejudices which nothing justifies. For there are scientific prejudices as there are religious superstitions. The former are no better than the latter.

Confront the time-honored reasonings of the savants with the simple deductions of logic and the aspect of the question changes, the edifice of antiquated conclusions falls to pieces, and a new spectacle presents itself.

No! None of the sciences can prove that the brain of woman is other than that of man. Several volumes might be filled with the possible refutations of the most salient thesis of the inferiority of woman.

Let us limit our illustrations to craniology. Women are reproached with having smaller and flatter brains than men. This accusation lingers in the works of nearly all the anthropologists. In point of fact, recent discoveries prove that cranial formation has nothing to do with intelligence. Much more: civilized humanity is tending more and more toward the brachycephalous form. The absurdities of Gobineau's cranial doctrine are now devoid of meaning. And this fantastic doctrine has ended by discouraging even its most fervent adepts.

The misogynists have indulged in all sorts of mensurations and psychological studies in order to demonstrate the veracity of their thesis. But if you control their operations, you always detect errors in their observations and in their calculations. Thus I once spent an entire year, to no purpose, in a physiological laboratory, to the end of verifying all that we have been taught regarding facial angles and certain physiological differences. I found there only such dissemblances as fail to warrant a conclusion of inferiority of any sort whatsoever.

For centuries, as we know, one reproach has been addrest to woman—that she has not the slightest gift of invention. I have applied to the patent offices of different countries and I have noted there, to my great stupefaction, a quantity of patents to which the names of women are attached. The number of these feminine inventions, as well as their quality and value, is increasing every year.

In studying the history of the sciences, we remark the enormous role played by women. We see in modern times (leaving antiquity out of account) women who attain the loftiest summit of the scientific achievement attained by men. Sophie Germain is one of the creators of mathematical physics; women like Caroline Herschel, Mme. Sommerville, Lady Huggins, who has contributed so largely to the creation of the astrophysical science concerned with the structure of the stars; Sonya Kovalevsky, Mme. Curie and many others leave no room for doubt regarding the intellectual capacity of woman.

In letters, likewise, woman occupies a brilliant place. If we reflect upon the recency of feminine education and upon the obstacles that have always been placed in the way of the emancipation of the feminine personality, we are rather astonished at the miraculous results women have achieved. We doubt then neither her capacities nor her worth.

Man would be wrong in claiming for himself the exclusive privilege of being a soldier even. The history of the past is full of proofs that in this domain also woman has succeeded in equaling man. Her courage, her spirit of sacrifice, her love of country, force the respect of every unbiased mind.

During the great revolution the French women displayed astonishing

evidence of a faculty for organization and for exercising command. The history of every nation always has in reserve a great number of heroines who are capable of demonstrating the physiological capacity of woman for war and her possession of the gifts of courage and of abnegation, which make her a good patriot in the noble sense of the word.

Women, altho not identical with men, are their equals. This postulate should guide all sexual polity. Woman has her biological personality, as she has a noble and grand mission to perform upon the earth. And the more she develops, the more will she become conscious of the divergences that separate her from man. She will not want to imitate man at the risk of losing precisely those qualities that constitute her charm and her *raison d'etre*. We imitate only superior beings; where our equals are concerned we maintain our independence.

In casting off her femininity, so as to adopt the virtues of masculinity, woman would prove herself, by that very token, inferior to man. The broadening of her intelligence and the hightening of her dignity will prevent the woman, whom the conditions of modern life create, from aping her companion in the journey of life. All apprehension of the disappearance of the feminine type and of the charms we style feminine is contrary to the psychology of the new woman. It is only by remaining different from man that woman may aspire to complete equality with him.

Equality in diversity is the supreme principle of the polity of sex.

It is a mistake, then, for the man and the woman to throw in each other's faces their reciprocal weaknesses or faults, for it is only by a complete union of their labor and of their virtues that they can accomplish the great task imposed by Providence: the realization of a paradise on earth.

Paris, France.

An Easter Canticle

By Clinton Scollard

I know along the upland trail
The frail hepaticas are pale
  As are the lingering drifts of snow
Deep down within some mossy dale.

I know that now a crimson fire
Kindles upon the leafless briar
  Where one day there shall bloom the rose
In all its orient attire.

I know the ferns and grasses stir
At root, and violet buds confer;
  I sense aromas faint and fine
Far-borne from aisles of waving fir.

I hear the pipers of the swales
Take up at dusk their vernal tales—
  High treble and resounding bass—
Until the midnight star prevails.

And from this wonderment I glean
Some sustenance whereon to lean;
  Born of the winter's dearth and death
A moving miracle is seen!

I rise above all doubt and dole,
My shrinking spirit clean and whole,
  Finding in re-awakened earth
The radiant flowering of the soul!

Clinton, N. Y.

From the Farm to the Consumer

Can the Cost of Provisions Be Reduced?

By Clyde Lyndon King, Ph.D.

To what extent, if at all, can the Eastern farmer affect the cost of farm produce to the city consumer?

Can a system of transportation and distribution be established so that returns to Eastern farmers may be increased and the cost to the city consumer reduced?

These are definite practical phases of the cost of living problem.

In devising a program that will at all affect the Eastern farmer and his neighboring city consumer, one factor must be clearly kept in mind, and that is that the prevailing prices on all farm produce are now made by nation-wide, and indeed by world-wide forces.

The forces which keep prices on farm produce practically uniform thruout the United States and the commercial world, and thru which the farmers of the Eastern States are placed in keen and active competition with the farmers of the newer and richer regions of the Mississippi Valley and elsewhere, are fourfold: 1. The comparatively low cost of transcontinental and oceanic transportation; 2. The practice known as diversion of shipments or selling in transit; 3. The use of cold storage; 4. The methods used in arriving at quotations on farm products.

The big factor in placing the trans-Mississippi farmer closer to the Eastern city than was the Eastern farmer ten miles out twenty-five years ago is the relatively small cost of interstate transportation. The Western farmer can get his produce from Chicage to Liverpool or from the Mountain States to New York and Philadelphia, at not over four cents per hundred pounds more than it costs the Eastern farmer to haul his produce ten or fifteen miles. That is, it costs as much to haul to market, whenever the haul aggregates ten or fifteen miles, as it would to transport the same produce by rail from three hundred to five hundred miles, or by water from six hundred to one thousand miles.

Moreover, any distinct advantage that might come to the Eastern farmer, due to increased local demand, or a decrease in local supply of farm produce, is now readily overcome by the facility with which farm produce from any section of the country can be diverted after transit is begun to the point offering the most favorable returns. Should there be higher prices in Boston, in Philadelphia, or in Pittsburgh a series of telegrams would divert carloads of foodstuffs already en route immediately to the point of shortage of supply or increased demand. The same plan is used in diverting oceanic shipments to points where highest wholesale prices may be secured.

The third factor in making for nation-wide wholesale prices in farm produce is cold storage. This makes for stability of prices not only for one locality as compared with another, but for one season as compared with another. Before the perfection of refrigeration facilities, the farmers in a given belt of longitude would have practically a monopoly over the sale of the season's produce in that particular belt. Now, however, as this belt moves northward from Texas to Canada, its produce is at once rendered available to all sections of the United States alike thru refrigeration and the other facilities herein indicated.

The fourth factor making for fluidity and acceleration in market prices for farm produce is the method by which crop reports are made up. These crop reports are the basis upon which the produce exchanges in the primary markets of the world base

their prices, both on current productions and on futures. The Bureau of Statistics in the United States Department of Agriculture is the most highly organized crop reporting department in the world.* In the employ of the Bureau are about fifty statisticians and clerks in the city of Washington, fifteen to twenty traveling reporting agents outside of Washington, a State agent paid for part of his time in each State in the Union, three thousand county correspondents and thirty thousand township and individual correspondents giving voluntary service as crop reporters. The bureau secures from these sources at least four classes of reports as to the acreage, condition and prospects of every class of farm or orchard output. On crop reporting day the statistician, with four assistant statisticians and agents, receives all four classes of reports and from them arrives at State averages and totals, and national averages and totals, including all the leading facts as to acreage and condition of each crop in each and every locality. At a stated hour this report, formulated behind closed doors, is sent worldwide by telegraph and telephone, and the reports furnish the basis for fixing market prices in all the primary markets of the world. To this national crop reporting agency is now being added an international crop reporting agency, with headquarters at the new International Institute of Agriculture in Rome. Each of the great produce exchange concerns has also its own crop reporting agency at work, not only in this but in all other countries. Thus prevailing price on farm produce is based on crop conditions in every section of the producing world. And, again, the influence of local production in any given part of any Eastern State in fixing farm prices is relatively small.

By these four forces, therefore, the wholesale price is fixed with a degree of rigidity over which the Eastern farmer and the city consumer have relatively little control. To the still greater detriment of the Eastern farmer, moreover, these factors give the city consumer a feeling of independence of conditions in the agricultural community immediately surrounding his city. The result is decreasing values in Eastern farm lands and decreasing urban interest in the outlying farmers. This, in turn, has led to unsympathetic, if not hostile, legislation; to a decrease in the purchasing power of Eastern farming communities, and hence a decrease in sales by Eastern cities; to a want of care on the part of the Eastern farmer to adapt his output and to grade and market his goods in a way suitable to the peculiar needs of the nearby city. If these conditions are to be overcome, definite, constructive, far-reaching steps must be taken whereby the Eastern farmer can secure definite advantages over his Western and worldwide competitors. These advantages can be secured by developing certain means of retail transportation now inherent in every Eastern city of any size.

The farmers elsewhere must ship by carloads; the future of the Eastern farmer lies in developing a transportation system whereby he can market in less than carload lots. The Western farmer must sell thru distant wholesalers or jobbers, and his produce must go thru the hands of not less than four middlemen; with proper transportation facilities the Eastern farmer can sell directly to the retailer or the consumer. The Western farmer must raise produce, and pack and sort that produce in a way suitable to the general market; with proper transportation facilities the Eastern farmer can adapt his produce to the market demands of a particular city. The future for the Eastern farmer, the Eastern city and the Eastern consumer depends upon the development of local transportation facilities that will place the farmer in the greatest possible proximity to the city consumer. The methods by which this can be done are:

1. Greater adaptation in the prod-

*For a more complete description, see article on "Functions and Needs of Our Great Markets," by Willet M. Hays, The Annals of the American Academy of Political and Social Science, January, 1913. Pp. 245-262.

uce grown to local conditions, an adaptation that the farmer selling at wholesale cannot hope to make; 2. By marketing produce in retail quantities instead of wholesale quantities and thus eliminating much of the cost that farmers elsewhere must bear; 3. By sorting and packing produce in a way to meet the needs of the local market and to secure top prices; 4. By multiplying the available number of shipping points; 5. By lowering the transportation costs from farm to shipping point; 6. By getting quicker and better transporting facilities from shipping point to market; 7. By securing the cheapest and most efficient means of getting goods to the particular section of the large city where needed; 8. By increasing yield thru coöperative credit associations and by increasing sales thru coöperative marketing and standardization of products.

This article is limited to the consideration of the transportation factors.

In casting about for new and more efficient means of transportation from the farm to the city, means whereby goods can be handled in small retail quantities rather than in large wholesale quantities, and means of value alike to the city and the country, three possibilities offer themselves for consideration. These are: 1. Increased use of the motor boat and other means of water transportation; 2. Increased use of trucks; 3. The increased use of trolley freight. The parcel post has significant possibilities in getting city products from the city to the farmer, but, until the law is thoroly remodeled, will offer but little assistance in getting produce from the farmer to the consumer.

By improving the navigable facilities on the Rhine at a cost of 0.17 of a mill per ton mile, the Prussian Government gave to Germany a system of water transportation the average transportation charge of which is 1.74 mills per ton mile. The average charge on the railways of the United States is 7.63 mills per ton mile; the average cost of hauling from farm to shipping point in the United States is 25 cents per ton mile. This indicates most forcibly the possibilities in cheaper water transportation for farm products. Especially with the development of the gasoline barge and the motor boat, the coastal waterways and rivers of the East offer significant opportunities not only for reducing transportation costs from shipping point to market, but for increasing the number of shipping points, and thus decreasing the cost of haul thereto. From Long Island to New York City the motor boat is bringing in an increasingly large amount of farm products. Some of the steam lines centering in Philadelphia and in Baltimore are likewise rapidly developing traffic in this way. By emphasis upon the cheapness and mobility of water transportation, and by the development of a connected intercoastal waterway along the whole Atlantic Coast, including the development of the New Jersey Ship Canal, the Eastern farmer and the city dweller will be brought much rial advantage of both.

The development of intercounty roads, with emphasis upon the use of motor truck service by farmers, wholesalers and retailers, offers a second avenue for revolutionizing the transportation facilities around the larger Eastern cities. This newer means of transportation offers at once cheapness, mobility and endless possibilities in the number of shipping points and the availability of the farm to each and every section of the city. Thru these agencies the products of the Eastern farm can be given a market at a cost entirely possible to farmers elsewhere.

Because of the large urban population in Eastern States there are radiating from each of its main cities miles upon miles of electric trolley lines. These trolley lines often, as in Pennsylvania and Massachusetts, run thru the best agricultural sections of the outlying country, and can, therefore, with but little added expense, render tributary to each city and to every section within the city, farmers' produce at a minimum

transportation cost and with a minimum expenditure of time and energy. Their use would readily double, if not treble, the number of available shipping points, and thus perceptibly diminish the cost of haul from farm to shipping point.

The uses to which trolley lines may be put as freight carriers may be classified as: 1. Carrying farm produce to market, and miscellaneous manufactures and merchandise to the country; 2. Carrying carload lots as feeders of the steam railroads; 3. Handling parcels and lighter packages into and out of the large cities; 4. Acting as a means of urban distribution.

Centering in Indianapolis are eleven electric express and trolley freight lines, bringing in upward of 15,000 tons of freight per month, the major portion being foodstuffs. The city secures over 75 per cent of its market supplies over trolley lines. A long distance telephone message at five in the morning brings fruit and vegetables from a radius of fifty miles. The result is a splendidly developed agricultural section; a better development of the manufacturing and commercial possibilities of Indianapolis, and a lower food cost to the Indianapolis consumer. South Bend and Fort Wayne, Ind.; St. Louis, Mo.; cities in Southern Illinois; Chicago; Columbus, Dayton, Toledo, Cincinnati and Cleveland in Ohio, are other cities that are profiting by such traffic. In many of these cities are open municipal markets with the trolley lines running directly to them, so that farmers may receive retail prices for their goods and consumers buy more cheaply. In Massachusetts there are about 3000 miles of street railway track. The greater portion of this mileage is within fifty miles of Boston. A definite effort is now being made by the Bay State Railway Company to develop incoming and outgoing trolley freight. The company already has in use seventeen express and freight cars, with a capacity of twenty tons each, heated by electric heaters to protect perishable goods in cold weather, and provided with open bulkheads for cooling purposes in warm weather. The express rates charged are 22 1-3 per cent lower than those charged by the old line express companies, while the freight rates average but from one to three cents per hundred in excess of steam rates. The Metropolitan Division of the Toronto and York Radial Railway Company has special schedules whereby shipments are made direct from farm to municipal markets in four of the towns served by the company.

Emphasis upon and the development of these new means of transportation is the first step to be taken in solving the cost of living problem. The results will be a marked advance in the economic well-being of the farming sections of every Eastern State; the focusing of attention upon the possibilities of the Eastern farm; the adaptation of farm output to the peculiar needs of each city; decreased cost to farmer and consumer thru direct marketing; increased purchasing power for the city's stores and manufactures; encouragement of the suburbs and discouragement of congestion; lower prices and better produce to the city consumer. The city does not end with its boundary lines; it is as extensive as its purchasing clientele. Coöperation of city and country is essential to the happiness and welfare of each.

And what is said here of the Eastern city and the Eastern farmer applies to cities and farmers elsewhere. Let city and country everywhere coöperate, and the farmer and the city dweller can both more largely sell and buy at home, thus encouraging mutual prosperity. Herein is a program worthy of greater civic effort.

University of Pennsylvania.

Some Problems of National Forestry

By Henry S. Graves

[The author of the following paper was temporarily relieved from his work as Professor of Forestry in Yale, to be Chief Forester of the United States, taking the position occupied by Gifford Pinchot. THE INDEPENDENT said of the appointment at the time that a better selection could not have been made, and the whole country has agreed with the sentiment ever since. As Chief Forester, Professor Graves brought to the department all of the energy, enthusiasm, and devotion of his predecessor. He is a young man, quick, keen, full of magnetism and good nature. He has been a careful and thoro student of our conditions for many years, and no one in America speaks with better authority.—EDITOR.]

For several years the conservation of our natural resources has been a subject of almost continual controversy. To many this seems strange, because repeatedly the country has placed itself most emphatically on record in favor of the underlying purposes of conservation. And it is as true today as at any time that there is a practical unanimity of opinion thruout the country that our forests should be protected from destruction by fire, and that it is desirable and wise to handle them so as to provide for a continuous supply of timber and so as to secure their protective influence on water resources. In the same way no one would dispute the public advantage of preventing waste in the exploitation and use of timber, minerals, and other natural resources, and of the introduction of methods of agriculture that will result in greater yield of farm products of all kinds.

Controversy first arises when the public thru Federal, State, or local governmental agencies undertakes to exercise such control over the development of natural resources as is necessary to secure the objects of conservation. The country stands aghast at the idea of the use of injurious adulterants and preservatives in foods; yet when it passes laws to protect the public health there is a conflict at once, and executive officers who make the laws really effective are subjected to abuse and pressure under the allegation that they are unreasonable and are interfering with industry. In practically the same way the controversies over conservation have to do almost wholly with questions of public participation in their development. There is a fight over water power because the public proposes to exercise a control over the use of power sites in the public domain and national forests and over the development of power on navigable streams, in the interests of the people at large. The controversy over the Alaskan coal fields centers about the question whether or not those valuable resources shall be parceled out to private owners without a control which will guarantee the protection of the public interests. State forest laws are unobjectionable until private owners are required to properly protect their property from fire and the question arises as to restrictions applied to the cutting of forests in the mountains, to prevent injury to the public thru erosion, irregular water flow, and torrents. And finally, national forestry is subjected to constant attack because the national forests are to be retained under Federal control and administration instead of being parceled out to private owners.

The first effective step in forestry in all countries has been the organization of a proper administration of the forests owned by the public. Forestry really began as a practical matter in this country when the Government established the national forests. These have now been under administration for about twelve years. The result is that many persons mistakenly believe that the forestry problem of the country is practically under way to solution. The fight for the continued control by the public of the resources it owns is by no means over. Only the first skirmish has been won. There is today a consistent and well organized fight to break down the national forest system and bring

about a distribution of the public resources into private hands, or to so cripple public control that the same end is indirectly accomplished.

The most recent and in many ways the most dangerous attack on national forestry is the effort to have the nation's forests and other public resources turned over to the individual States. This proposal has been agitated in certain quarters for several years. During the past year it has been gathering increased support.

For a long time the fight on conservation was directed mainly at the national forests because these were the first areas withdrawn from disposal to private owners and were the first public lands put under constructive administration. Of late the opponents of conservation have vigorously attacked the withdrawals from the public lands of water power sites, coal fields, phosphate deposits and oil lands. There have been withdrawn some 66,000,000 acres of coal lands. These are withheld only pending classification and appraisal. The water power sites are released as permits are granted for their use. The phosphate and oil fields are withdrawn pending affirmative legislation to permit their development under public control. There is further an earnest effort to secure legislation to place the public range under proper regulation. This great area, aggregating over 300,000,000 acres, is every year being more and more reduced in productivity because of abuse by overgrazing. Already the carrying capacity for stock has been reduced to one-half the normal. This, the country's greatest source of meat supply, is owned by the nation and is being depleted thru lack of regulation. The present efforts of those opposed to public control of the nation's resources are directed both to breaking down the national forests, which are already organized and under administration, and also to preventing the placing under permanent management of the lands now withdrawn for coal, phosphates, oil and water power, and the unreserved public range.

Conservation is attacked under the allegation that it blocks development. The extensive withdrawals above mentioned are pointed to as proof. The coal lands and water power sites are withdrawn for use, not to prevent it. Phosphate and oil lands are withdrawn only pending action by Congress to permit their development under proper public control. They are withdrawn to prevent their passing from public ownership before such legislation can be secured. In their present condition the last mentioned withdrawals are not yet subject to the operation of practical conservation; they are merely reserved for Congress to grant authority for their proper development.

The national forests, on the other hand, have been already organized for the development of their resources. They are used today by hundreds of thousands of people and every year sees their use enormously increased.

The national forests comprise a gross area of about 19,000,000 acres of land. They are located chiefly in the mountains in the Far West. They cover the bulk of the more rugged portions of the Rocky Mountains, Cascade, Sierra Nevada, and Coast ranges. There are, further, national forests in the Big Horns of Wyoming, the Black Hills of South Dakota, the Ozarks of Arkansas, as well as in the Sand Hills of Nebraska and Kansas, and small forests in Michigan, Minnesota and Florida. In addition, about 26,000,000 acres are located in Alaska, and one small forest in Porto Rico. Before their establishment as national forests these areas were unprotected. Fires ran over them almost unhindered, with a loss to the country of many millions of dollars. The land laws were such that the most valuable resources were passing into private ownership at a very rapid rate, chiefly in the hands of large interests. The purposes of the national forests were to protect the timber from devastation and to provide for a development of the resources which would not only afford a continued production of timber and

of water under stable conditions of flow, but would prevent monopolies of the resources which might react to the injury of the general public.

The charge that the national forests block development is utterly unwarranted and the contrary is proved by the facts.

Take first the question of agriculture. It has been claimed by many that there are many millions of acres of agricultural lands in the national forests which the present Administration is withholding from settlement in order to grow trees on them. What are the facts? In the first place there are not, as claimed, great areas of agricultural lands in the national forests. The large bodies of agricultural land have been excluded. There are, however, in the forests many tracts of value for agriculture, chiefly in small bodies and scattered units, which on all the forests together aggregate perhaps from 2 to 2½ per cent of the total. These are not being withheld from settlement, but are being opened up as rapidly as is possible. The Forest Service has authority to classify the agricultural lands and list them for entry under the Forest Homestead Law of 1906. Already about 1,500,000 acres have been segregated as agricultural for the benefit of settlers. The rest is being classified as rapidly as is possible. When they are under heavy timber, the timber is offered for sale and the land opened up after lumbering. Thus, in one forest in Northern Idaho, sales aggregating 500,000,000 feet are being advertised under conditions which will clear as soon as possible some 5000 acres of agricultural lands. Another sale of 200,000,000 feet in Montana will clear 9000 acres of agricultural land. The same policy is being carried out thruout the forests. Heavily timbered lands are not opened to entry before cutting, because settlement would not follow, as has been demonstrated over and over again. The entryman acquires the land and he then usually sells out to a timber company, which holds the timber until it gets ready to cut, and then sells the land to settlers for as high a price as it can get. The seeker after cheap land is absolutely excluded under such conditions. But the Forest Service removes the timber, and then *gives* the land to the settler. This process is shown in many forests where Government agricultural land is rapidly passing into the hands of *bona fide* home seekers, while interior holdings belonging to private owners, originally taken up as homesteads, remain undeveloped and will finally be available to settlers only at a high price. One of the reasons why people have been deceived as to this question is because in traveling thru the forests they have no means of distinguishing private holdings from Government land. As a matter of fact, the best land was usually selected by the timberman because the rich flats, bottoms and benches are those which carried the best timber. Here is a clear case where private ownership is blocking development, and the national forests are securing it. This is the reason why the residents of Kootenai Valley, in Montana, have petitioned against any elimination of the timbered bottoms.

The statement has frequently been made that the national forests interfere with mining development, that prospectors and miners are subject to severe restrictions, and that the mining laws are interpreted so narrowly that patents are needlessly held up or actually prevented. Such statements misrepresent the actual conditions. The mining laws apply to the national forests just as to the unreserved public lands. A prospector is allowed to work anywhere with entire freedom; all that is expected of him is that he shall exercise care in the matter of fire. Under the law he has the right to use any or all of the timber on his location for development purposes; if this does not suffice, he is granted free use of the surrounding forest. The going mine, developed and shipping ore to market, is of course expected to pay a reasonable price for timber not situated

on the claims, but the Government is exceedingly liberal in its free grants of timber during the development period of the mine.

There has been complaint on the ground that national forests mining claims are scrutinized when they come up for patent, to determine whether the laws have been complied with. The mining laws lay down certain requirements as to the actual discovery of mineral and as to development work. The purpose of these requirements is obvious; namely, to prevent fraudulent acquisition of the land under the terms of mining laws. In the past, before it was customary for the Government to examine mining claims on the ground previous to issuance of patent, the mining laws were repeatedly used fraudulently to secure heavily timbered tracts for commercial lumbering, to secure valuable water power sites, to secure water sources controlling thousands of acres of public range, to secure town sites for speculation or areas valuable for summer resort development, and to secure areas blocking valuable rights of way. The prevention of such fraud protects the interest of the public which owns the land and it also protects the mining industry itself from wildcat promoters whose actions more than any other factor have resulted in injury to mining developments. The majority of those engaged in the industry desire an orderly administration of the mining laws. Certain interests, however, have been actually urging that the officers of the Government be prohibited from any field scrutiny of mining claims to see whether the claimants have conformed to the requirements laid down by Congress.

Among the most persistent opponents of conservation and the national forest system have been certain water power interests. This is because most of the streams containing water power in the West rise in the national forests, and the Government has taken the position that it will exercise a public control over the development of the water power sites. The present laws are inadequate, for they only authorize the executive officers to issue permits which are revocable at will. Without question this law acts to retard water power development, altho under it over 200 permits are outstanding on the national forests. The departments at Washington have consistently urged legislation that would enable the granting of a term lease under regulations that are reasonable to the developer and which will fully protect the public interests. These efforts have in all cases failed because of the opposition of the water power interests, which have endeavored to secure terms not compatible with the protection of the public interests. In other words, the development of water power has been retarded only because the water power interests have undertaken to demand what the public should not grant.

Timber on the national forests is being sold in increasing amounts as there is the demand. The best and most accessible timber was obtained by private owners. Therefore, the less accessible Government timber does not find a ready market. Nevertheless, upward of a billion feet have been sold every year, and since July 1, 1912, to the time of writing this article, one and one-half billion feet have been sold or the sales guaranteed. This timber is cut under methods which insure the establishment of a new crop, so as to continue the production of timber to the maximum.

The grass on the forests is also put to its fullest use under a system of regulated grazing. Over 9,000,000 head of stock are grazed under lease. The forest range, which formerly was overstocked and run down, is being rapidly restored to its normal productivity, the stock comes off the range in fine shape, and the carrying capacity of the range is being increased.

The extensive use of the resources of the national forests is shown by

the fact that the timber sales during the past year numbered nearly 6000. Free use of timber was granted to over 38,000 persons. Permits for various special uses covering over 100 different purposes were issued to the number of nearly 5000. Between 40,000 and 50,000 miners are operating within the national forests under conditions which work to the advantage of legitimate mining, and fully 400,000 persons use the national forests for recreation during the summer months.

The protective work of the Forest Service not only saves the timber resources from destruction, but promotes the conservation of water supplies affecting a very large number of people. The national forests comprise watersheds which conserve the domestic supply for over 1000 cities and towns. It protects the waters of over 1200 irrigation projects and over 300 water power projects.

The Government, thru the Forest Service, is doing an immense amount of development work by opening up inaccessible country thru roads and trails. There have already been constructed by the Forest Service 1613 miles of roads, nearly 13,500 miles of trails, and over 11,000 miles of telephone lines. This work is of the greatest importance to the local development of the country.

Thus it will be seen that those who charge that conservation is blocking development are either misinformed or are using this argument to destroy the system of national forestry. National forestry is no longer an experiment. It has demonstrated its public benefits. Its advocates may justly claim the support of the country for the continuance of a work whose success is of vital importance to the welfare of the nation.

Washington, D. C.

The Confessions of a Poet

[This very ingenuous disclosure of the ambitions and poses of a young author during the period when he is struggling to find himself and achieve recognition has a certain psychological interest, for it reveals moods not uncommon among young men or among young women if we may take the *Diary of Marie Bashkirtseff*, with its latest additions, as evidence.—EDITOR.]

Strange to say, as a child I detested poetry. Perhaps this was because of the kind the teacher made me commit to memory. I remember well how I despised the threadbare rimes of Longfellow. My favorite reading was the geography and all the dime novels I could procure. The old woman who sold them was half blind, and so I used to take three off the pile at once, while paying for but one.

It was not till my twelfth year that I became interested in poetry. It was then that I came across a copy of Byron which belonged to my father. First, the cynicism, the abandon, the romantic flavor of the poet's verse captured my fancy; later I acquired a liking for the swing of rhythm and the recurrence of rime.

And now I began to write in the Byronic style, as what fledgling poet since his time has not done! Denunciations of the pettiness of Man and apostrophes to Nature in her wild and solitary aspects flowed from my pen. I also sang of bul-buls, of the Alps, and of Napoleon.

At the same time, true to the instincts of a future magazine poet, I tried to sell my output to the periodicals of the day. I was, of course, not successful. But this period of callow endeavor taught me one thing—not to be disheartened by rejections. For many a promising poet never brings his muse to maturity because of this common discouragement.

In his earlier years, and, in fact, all thru life, a poet's days are threaded together in a succession of moods. He sees so many viewpoints that his imagination only halts this side of infinity; and, before he learns by bitter experience that it is life-wrecking to do so, he tries to live out all

his moods and impulses—not realizing that most of them are given him only to be put on paper. Like the actor, he feels the passion to impersonate the characters of others and to take on their mannerisms. But the actor confines himself to the stage while the poet too often takes the dangerous medium of real life.

I soon past out of the Byronic stage and into a worse than ever. Kirke White, the young poetic apostle of piety, midnight oil and melancholy, became my next deity. He was a boy who studied himself to death, but left enough poetry on the backs of his mathematical papers to enable the laureate Southey to bring out a posthumous volume of his. Following my new idol, in verse written at midnight I compared my unhappy and perishing youth with the passing light of a burnt-out candle—"The taper's dying gleam" I phrased it. The light I wrote by was gas, and it took only another quarter in the slot to make it flare up brighter than ever!

But these various poses I am describing, tho seeming unreal and comic now, were more than merely mimetic. And, after all, only the outsider sees the comic in any one's life. No, my attitudes were real and hurtful, for I was not posing for others but for myself! I used to stay up all night and study. At the time I was working in a factory. I had rebelled against school, because the teachers emphasized commercial arithmetic almost to the exclusion of other and more interesting studies. And, at least, I did not intend to become a grocer's clerk or even to go into any kind of storekeeping business.

So I fought against school and defied both my father and the truant officer. I spent my time in the little library I had built up, reading, writing, and studying—or taking melancholy and poetic walks alone. People had already begun to comment on my eccentric appearance.

My father, alarmed at the turn my life had taken, declared that it must now be either school again, or work. I chose work, much as I hated it, in the factory in which he was one of the foremen. And, once at work, I must straightway imagine that I was having no chance in life and that I must act the young genius struggling in vain under insuperable difficulties and neglect. I became sickly and morose. Adolescence added to poetry is a terrible thing. I wonder how many of the stories of the early struggles of authors are actual and not mostly imagined? For it goes with the artistic temperament to make a mountain out of a mole hill.

Up to this time I had not yet found out what real poetry was. When I discovered a volume of Keats in a second-hand book store which I frequented I was put on the right road, and henceforth I began to get occasional *personal* letters of regret from editors instead of the stereotypt rejection slip.

Keats, however, was responsible for the continuance of my sincere pose of a neglected genius destined to die unlamented and unknown. Tho then but barely fifteen, I believed that already I was almost as great as Shakespeare.

And now came the worst pose of all: I became "precious." And with this esthetic vice I took up with Laus Veneris and Baudelaire. Tho in reality as innocent of evil experience as is the wool on the lamb's back of dye—I grew a very monster of metrical passions and paper depravity—I wrote much of Astoreth, of Nineveh, of Babylon. I sang of beautiful wicked dead passionate queens, and extolled the splendid sinning of the Renaissance. I often used to catch my breath at my own ineffable wickedness. I was pessimistic, bored, and world-weary. Having never *lived* life, I felt that I had experienced it all and had found it bitter and empty.

A change came over my existence. I left home. I traveled, experienced, suffered, lived, and had real literary struggles. One by one my little writer moods were pummeled out of me by the world. And now my verse began to sell. Little by little I pushed into the magazines. I nearly went mad

with joy when I saw my first poem in print.

There were three magazines which rejected my verse so consistently that I resolved on battering down their exclusiveness. I bombarded them every week with poems. From the first magazine, an old one decidedly belletristic in style, I at last evoked a personal note of appreciation. And I almost sold them a "sonnet" of thirteen lines. Had I not insisted on not adding a fourteenth line they would have printed it. They admited that, otherwise, it was a fine poem. Since then that magazine has rejected everything I've sent in. The second magazine was old, conservative, and also highly literary. Month after month its editors kept rejecting my work. Finally one of them, in desperation, invited me to give them a twelvemonth's rest. Instead, that very night I drank a pot of strong coffee and, under its stimulus, wrote two of my best poems. The next morning I sent them, special delivery, to the desperate editor—and he accepted them both!

The third and last magazine which would have none of me I determined to play a joke on. I sat down and did a lot of haphazard, intricate riming like Swinburne at his worst. I put in a lot about stars, flowers, seraphs, moons, and rising and setting suns, and then licked the whole into fairly coherent shape. To my amazement the magazine at which it was aimed accepted it. And, afterward, when I saw it in print, I rubbed my eyes in astonishment. The joke was on me. It made excellent sense. I had really perpetrated a first rate poem. I thought of what Plato says about poets being inspired idiots who know not the manner of what they write.

With my success with the magazines again there came to me visions of fame won overnight, and enough royalties to live on. Every poem of mine that appeared in print I fondly hoped to see carry me into the front rank by some masterly phrase or great expression of common human experience—and always I was undeceived.

For still I am only a poor magazine poet, an attic dweller, unmarried—no better nor worse than a score of others who conveniently fill up pages at the end of a story or article. As I said before, *now* I know real poverty, genuine suffering. My friends want me to go to work on a newspaper or try prose, but I won't. I believe poetry is a man's work. I am young. I am fighting for fame with both fists, and like the fight. And at last I've got a publisher. I shall bring out a book soon. Of course it won't sell much. Poetry never does, I'm told. But I have hopes . . . I have hopes . . . some day. . . .

The Flow of Sap

Descriptive of Some Simple Experiments in Spring Phenomena

By Edward F. Bigelow

[Dr. Bigelow does not profess to explain all of the mysteries of the rising of the life blood of the trees, but he shows how this force can be demonstrated by means of apparatus easy to be set up in home or school. Readers of *St. Nicholas* and attendants at chautauquas and summer schools have for many years been familiar with Dr. Bigelow's methods of nature study.—EDITOR.]

Go to the grapevine, cut off the end and put the cut end of the main vine into a bottle. Tie it fast. In a short time the bottle will be full of a sweetish liquid.

Go to the maple when the days are warm and the nights are freezing, bore a hole in the trunk of that maple near the ground, insert a tap, put under the end of that tap a pail, and in a few hours the pail will be full of the delicious sap that contains so much of sweetness that it may be concentrated into the well-known maple syrup, or in blocks of maple sugar.

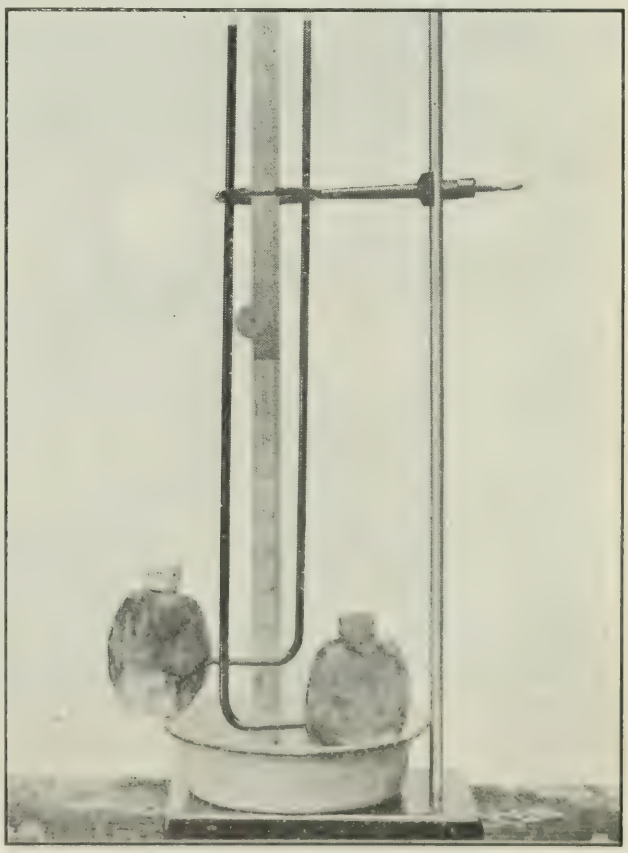
Even a child would naturally ask

what makes the sap flow. Even the most learned man must, after years of study by his own efforts and those of others, be forced to say, I don't know. There have been a large number of careful, prolonged, intense studies of the flow of sap, especially of the maple. There have been a large number of theories, each holding its own for a time only to be set aside for another seemingly preferable. We have tried to explain the phenomenon by osmosis, we have tried to explain it by stating that it is due to the action of living cells. You may take your choice; one means practically the same as the other, for each one means, I don't know. No man, woman or child in the world does know. It is true of this as of other things pertaining to life, "For now we know only in part." The intensest peering thru the highest power lenses does not throw light upon the question; "we see thru a glass, darkly." We could now and then find glimmerings of truth. Sometimes, almost in a bit of inspiration, we might say that sap starts at the tip of the finest root hair and works from cell to cell up to the leaves. It seems simple enough. The great problems in life are the simplest. But when we come to make definite experiments, when we come to apply any one theory, we find that we have not enough to solve the problem. What is the cause of this pressure? Why does sap flow better when it is cooled at night and warmed by day? One learned experimenter sums up a long series of experiments by stating, "The flow is in a general way coincident with, and proportional to, the pressure." Clear, isn't it? It is a concise, euphonious, well-balanced sentence, but it clears up the tangle fully as lucidly as it would to explain to a little child, "Why, don't you know how many six are? Why six, my little child, is half a dozen." And then the learned experimenter goes on further to state: "The only theory so far advanced that can account for all observed phenomena is the living-cell theory. This seems in most respects satisfactory."

Of course that is "satisfactory." It is just exactly as satisfactory as when the old lady went to a doctor and told him all the details of the fact that she was troubled with not being able to sleep nights. The doctor held his watch and counted her pulse, he listened at her chest and put a thermometer in her mouth and made a record of her temperature and further data in a big book. Then he said, "Why, my dear lady, it is perfectly clear to me that you are troubled with insomnia." Can you imagine the relief of that old lady to have her case fully diagnosed? With a sigh of relief she exclaimed, "Oh, doctor, is that all? Why, I thought I had a complication of troubles." "No, madam," he replied, "it is merely insomnia, that's all."

And so to come back to our experimental scientist and all his predecessors. Beautiful, isn't it? The "living-cell theory." That is, in other words, the sap does go into the roots and in some way gets up to the leaves, and the whole thing is made clear by stating that the tree is alive. Now you understand it, my friend, don't you? And if there is one shadow of doubt in your mind, just remember this as a clincher of the argument. You have never known the sap to go up a dead tree. Then, of course, the run of the sap depends upon the living cell.

But while we may never know except in part, it is sometimes mighty interesting to study that part. There is one admirable thing about osmosis —it gets there (pardon the colloquialism); it gets there even when common sense says it cannot. And it not only gets there by mere arrival, but with power and effect when it arrives. All the populace may take microscopes and look at a firm drumhead, and say, "Nothing can go thru that any more than thru a piece of tin"; but the interesting fact is that that piece of drumhead has a way of doing things for itself, a way to astonish all predictors as to its ability. Place that drumhead over the larger end of a lamp chimney and tie it on firmly. Place over the top of that lamp chimney and firmly tie down a sheet of thin India rubber, having previously



CROWDING IN TO GET THE SUGAR
Simple apparatus for demonstrating osmotic pressure.

put within the chimney some sugar and a little water, making a thick syrup. Now the water outside of this chimney, we might say figuratively, becomes covetous of that syrup inside the chimney. But it cannot get there, or so says popular opinion, because the impervious bit of sheepskin is in the way. To some young people who are saying, "Oh, I can never do that; I can't succeed in getting the syrup —it is beyond my reach," I should like to hold up that sheepskin as an obstacle, and the water as an example of persistence.

Then the water starts in and goes thru the sheepskin; that is all. It goes to work and learns the secret for itself, and puts that secret into action in its own way, and does it so effectively that it makes a decidedly bulgy impression on the India rubber at the top of the chimney.

Or take a potato from the cellar. It is full of cells, and each cell is so complete in itself that it seems to be even a stronger barrier to the penetration of water than was the drumhead. Bore a hole in this potato, put in a little sugar and water, and a few drops of ink to keep tabs on the water so as to know where it is going in case it should go anywhere. Cork up the top of the potato, and put a tube in the side. Water in a dish outside of the potato becomes as covetous as that water below the drumhead. The water says that it can get in thru the cells of the potato, but no one sees it doing so. It does it, and does it so effectually that it pushes up the inky fluid to a hight of 20 inches, as is shown in the illustration.

Now suppose there was another pan of water at the top of that 20 inches, and another potato. Why could not this water force itself into another potato, and push onward for another 20 inches, and so on and so on? Simple as can be—as simple as the multiplication table. One potato will push it 20 inches high, twenty potatoes will push it 400 inches high, and that is about 33 feet—the hight of a tree. Now do not think that drumheads, and sheets of rubber tied on lamp chimneys, and inky, sweetened water

THE POTATO PUMP
How the lifting force of a living cell can be measured.

rising out of a potato, tell us how sap goes up a tree. It shows us a part of the interesting process, and a part is better than nothing. A little knowledge may be dangerous, but it may also be a mighty interesting thing. There is a satisfaction in wishing for more. It is so in the study of sap flow in the spring. While we cannot find out all we want to know, it is a satisfaction to find out a little. Our drumhead and our potato set us to thinking. We have a greater respect and a deeper interest for those tiny cells. Root hairs and plant cells mean more to us than they did. Perhaps our potato with the hole in it was a small and thick walled cell that sets us to wondering how that water got where the sugar was, and how the moisture in the ground in the spring got into that root and climbed to the top of the tree. Haven't I clearly explained it to you? It is all done by the living cell and by osmosis.

What is a living cell and what is osmosis? That is not a part of our lesson today. Do not bother me now about the things that I do not know.

SPRINGTIME IN MERRY ENGLAND

The British Suffragets spaded up a number of putting-greens, leaving behind placards: "No votes, no golf!"

THE NEW BOOKS

A Farmer-Naturalist

Have a dozen of our readers any knowledge of that "Illustrious Obscure," as Hazlitt calls him, St. John de Crevecœur, author of *Letters from an American Farmer?** He was one of the three authors, says Hazlitt, worth reading, whom the English settlements in America produced in the eighteenth century; and his glowing accounts of innocent primitive life in the new settlements kindled the imaginations of Campbell, Byron, Southey, and Coleridge; attracting, too, not a few settlers to the new country.

Crevecœur, who was a Frenchman by birth, and served under Montcalm, wandered down along the Hudson River about 1760, after the loss of Canada to the English, dropt his French name for that of St. John, was naturalized, married, and took up the life of a farmer in the British colonies. Yet he was not so tied to his estate that he could not travel east to Nantucket and south as far as Charleston, not for business, but out of a certain philosophical desire to learn the manners of a nascent civilization. His book, which was famous in its day, but has since been almost forgotten, was in the form of long letters. These, tho written years before, were first published in London in 1782. The book was reprinted in England, Ireland and America, and translated into French and German, yet only a single imperfect edition has appeared during the succeeding century and a quarter until the present neat and handy issue.

For that most interesting period of American social life just preceding the War of the Revolution, Crevecœur is the best, if not almost the only authority. But for that he is charmingly and even minutely descriptive. He pictures the life of the successful farmer and of the border ruffian of the day who lived on the outskirts and supported himself by hunting and stealing. He is enthusiastic as to the opportunities for success, and gives instances of those who from the lowest condition had made themselves possessors of large estates. Particularly he rejoices in the liberty of life freed from the despotism of government or tradition. One is reminded of the late parallel in the wondering delight of the Russian Jew coming to this country, as told by Miss Antin in her late volume, *The Promised Land.*

Just as the *Colloquies* of Erasmus give us the most intimate picture of European life in the time of Luther, so these *Letters* tell us what life was in our colonial days. Crevecœur does not neglect physical conditions, and we read with absorbed attention the vivid description of the brilliant humming birds that darted about his celandine ("salendine") blossoms, and of the deadly battle between a black snake and a water snake, which ended in the latter being devoured by its stronger opponent. The first story of bee hunting in the forest is told by our author, and, will it be believed? he had a nest of hornets in his house which injured nobody and cleared the rooms of flies. Crevecœur as naturalist stands midway between the wise naivete of Champlain in the preceding century and the experiments and popularizations of Fabre in our own day.

But it was in "humans" that his chief interest lay. We learn that of twelve Germans who came to the new country nine were successful, for their wives took part in all their out of door work; of the Scotch seven

**Letters from an American Farmer.* By St. John de Crèvecœur. Edited with an introduction by Warren Barton Blake. Pp. xxiii, 256. New York: E. P. Dutton & Co. 35 cents.

gained success, and four Irish. The latter, he says, loved to drink and were quarrelsome and "soon take to the gun, which is the ruin of everything." He lays their ill-success to the neglect of agriculture under the land laws of Ireland.

Five chapters are given to conditions of life in Nantucket and Martha's Vineyard. The methods of fishing for cod and of the whale fishery are admirably described, with a minuteness reminiscent of John Denys's *Acadia,* and the manners of the Indians and the causes of their rapid extermination. The letter-writer has only praise for the treatment of the Indians by the settlers of New England. Indeed, New England has his special praise for its settled laws and religious condition. This was, indeed, the admiration of more than one French visitor to the America of the eighteenth century; Talleyrand writes of that liberty and equality of worship which was "one of the strongest guarantees of social tranquillity; for where consciences are respected, other rights cannot fail to be respected likewise." So Talleyrand; but Crevecœur, in praising these conditions, bitterly condemns the treatment of slaves in Carolina; not that he was hostile to slavery as an institution, but for its cruelty, quite different from the kindness the slaves in the Middle Colonies received.

That Crevecœur had the spirit of the naturalist appears not only in his descriptions of birds and snakes, but in the account of his visit to the gardens of John Bartram, the first American botanist, by whom he was entertained for several days. At his first meal he notes that Mr. and Mrs. Bartram sat at the head of the long tables with their family and guests, then the hired men, and then the negroes, all eating together. He tells of his host's agricultural methods, which produced as much as thirty-six bushels of wheat to the acre, and nearly three tons of the best hay, a story worth reproducing in our modern agricultural journals.

It is a fascinating volume, and Mr. Blake deserves thanks for rediscovering it and editing it with adequate introduction and notes. It should be read in honor of our ancestors.

W. H. W.

The American Occupation of the Philippines

This is a subject that from now on will occupy a large share of the attention of Congress and the American people, and the fact that Judge Blount's book has "the unqualified endorsement" of our new Secretary of State, Mr. Bryan, gives it special significance. The last time we had a Democratic President he tried to force back Hawaii to the monarchy and, if good Queen Lil had not insisted upon cutting off the heads of the missionaries and sons of missionaries who had overthrown the savage dynasty, Mr. Cleveland's plan might have been carried out.

President Cleveland's advisor and "paramount commissioner" in the Hawaiian affair was James H. Blount, who, now that another Democratic administration has come into power, urges the abandonment of the Philippines as, twenty years ago, he urged Hawaii's. He speaks from experience, for he served in the Philippines as lieutenant of volunteers for two years and as United States District Judge for four years, and he has diligently studied the documentary history of the annexation period. Yet the author by no means displays a judicial temper. He regards Dean Worcester as "an overbearing bully of the beggar-on-horseback type" and "the direst calamity that has befallen the Filipinos since the American occupation." Mr. Denby is guilty of "rank hypocrisy." Mr. Root is "a dangerous man to republican institutions." The messages of Mr. McKinley are "insufferable drivel"; those of Mr. Taft and Mr. Roosevelt "preposterous stuff" which they "were publicly pretending to believe." The report of the minority of the Insular Affairs Committee is "rot"—and so on. But Judge Blount is equally

[1] *The American Occupation of the Philippines,* 1898-1912. By James H. Blount. New York: G. P. Putnam's Sons. $4.

frank in expressing his approval of such acts as he likes, for example, the purchase of the friars' lands, the reform of finances, the codification of laws and establishment of schools.

Because of the author's thoroness and obvious sincerity this book may be regarded as the most that can be said against the American administration, and so regarded, the argument for a change of policy seems to us singularly weak and inconclusive. Essentially Judge Blount bases his book upon the reiterated assumption that a republic cannot possess "colonies." This is manifestly false. The United States has always had "colonies" from the earliest times and perhaps always will. On the whole our government of such dependencies has been good, and it is not uncommon to hear people of a newly admitted State complain that they were better off under the territorial regime. There is no apparent reason why a republic should not manage semi-self-governing dependencies as well, or better, than a monarchy could. At any rate we are quite convinced that the Philippines are better off under the control of the United States than as a colony of Germany—which they would now have become but for the firmness of Admiral Dewey.

Judge Blount has no doubt of the ability of the Filipinos to govern themselves, but we presume that he is opposed to giving the ballot to the colored men of his own State, Georgia. At any rate he is careful to explain that he treats them very differently. The passage is so amazing and illustrates so clearly the standpoint of many Democrats who are now clamoring for the rights of the Filipinos to self-government that we must quote it:

> Judge Carson and myself had one peculiar qualification for fidelity to the Taft policies for which we were entitled to no credit. We instinctively resented any suggestion comparing the Filipinos to negroes. We had many warm friends among the Filipinos, had shared their generous hospitality often, and in turn had extended them ours. Any such suggestion as that indicated implied that we had been doing something equivalent to eating, drinking, dancing, and chumming with negroes. And we resented such suggestions with an anger quite as cordial and intense as the canons of good taste and loyal friendship demanded. I really believe that the Southern men in the Philippines have always gotten along better with the Filipinos than any other Americans out there, and for the reasons just suggested. Not only is the universal American willingness to treat the educated Asiatic as a human being endowed with certain unalienable rights going to redeem him from the down-trodden condition into which British and other European contempt for him has kept him, but the American from the South out there is a guarantee that he shall never be treated as if he were an African. The African is aeons of time behind the Asiatic in development; the latter is aeons ahead of us in the mere duration of his civilization.

The best picture of the Philippines under the old regime is to be found in the novels of Jose Rizal, of which we now have a complete English translation with careful annotations. The first of these, *The Social Can-*

JOSE RIZAL

The Filipino patriot and martyr whose novels portray conditions before the American occupation. From this photograph, taken in Paris, was designed the portrait put upon the Philippine postage stamp by the United States Government.

cer,[2] is preceded by a well written introduction of fifty pages by the translator sketching the history of the Philippines from the Spanish conquest to the advent of "Democracy under her Star Banner to the tune of Yankee-Doodle-Do."

Mr. Derbyshire explains clearly but with admirable temper the conditions against which Rizal revolted in vain. It appears that the Filipino patriot was not directly concerned in the conspiracy for which he was executed, but it is easy to see how, from the Spanish point of view, his death was deemed necessary, for there was no greater enemy to political and ecclesiastical tyranny that Rizal, and his books were more dangerous than bombs.

Many of the evils against which Rizal directed his satire have been remedied by the American administration. Life and property are certainly more secure; freedom of speech has been gained; the American priests are superior to the Spanish friars they have replaced, and the education which Rizal longed for above all else has been brought to the people. In the American schools are no such scenes as he describes in the amusing chapter "The Class in Physics" in *The Reign of Greed*, where the Jesuit professor, leaving his apparatus untouched in the glass case, tangles up his students with metaphysical questions about "attributes" and "essences."[3]

Rizal's hopes for his people have thus in a measure been accomplisht and in a way not entirely unanticipated by him, for as early as 1889 he prophesied that Spain would shortly lose the Philippines and that the United States would gain them. We believe that if the novelist were now living he would not be dissatisfied with the results of the change of sovereignty.

Seeking the Historic Jesus

Historical facts, legendary additions, and theological speculations are so entangled and confused in the traditional pictures of Jesus that it is no easy matter to uncover and retrace the lineaments of the real historic figure whose life and work form the basis and inspiration of Christianity. The fact that the literary documents which constitute almost the entire source of our knowledge of the Galilean Peasant have been enshrined in a sacred book interposes great obstacles to the free and untrammeled handling of the materials which the scientific investigation of the subject demands. On the one hand, religious prejudice seeks to exempt the Gospels from the literary and historical criticism necessary to a careful sifting of the evidence and a reconstruction of the biographical data; on the other, honest seekers must be on their guard against the unwarranted and shallow caricatures which anti-religious speculators put forth from time to time in the name of sober history. The limit of fatuity seems to have been reached in the attempt to offset the claims of divine perfection made in behalf of the impossible traditional figure by the far more unfounded claim that Jesus is not at all a historic person, but an idealization of imperfectly realized religious aspirations. To establish the latter contention it is of primary importance to demolish the historical foundations of the New Testament epoch which have been slowly and patiently laid by modern criticism. This the school of Robertson, Drews and Smith has attempted, but utterly failed to accomplish. The inadequacy of their theories and the superficiality of their reasoning and methods are carefully but mercilessly exposed by Dr. Thorburn in his scholarly reply[1] to Professor Drews' *Die Christusmythe*. This detailed examination of the theory of the mythical-social origin of Christianity and

[1] *Jesus the Christ: Historical or Mythical?* A Reply to Professor Drews' *Die Christusmythe*. By Thomas James Thorburn, D.D., LL.D. New York: Charles Scribner's Sons. $2.50.

the shadowy supports on which it rests fully meets the anti-Christian assaults on the work of the liberal theologians of the critical-historical school. At the same time the author makes it clear that Christian defense can be maintained only on the basis of a sober criticism. Here is his conservative and reserved statement of the case:

> If we would comply with the demands of modern scientific history, we must get *behind* the Gospels, in order to obtain a knowledge of the actual life and teaching of Jesus. Our present Gospels, it is urged—and with some truth—are largely accreted with contemporary, and later, views *about* Jesus, views not necessarily wrong or superfluous, it may here be added, but by reason of which the *purely historical* Figure is, to some extent, obscured and hidden from view.

Of equal learning but of far less value is the volume of Elliott Lectures,[2] delivered in the Western Theological Seminary by Prof. David Smith, of Londonderry. The author defends with much ability the historicity of the Gospels and the accuracy of their portraiture of Jesus, but he uses the methods of the special pleader and appeals to religious motives rather than to the historic judgment. The present disquieting effects of criticism in the popular mind may be somewhat allayed by the confident assurance of one qualified by study and experience to speak with authority, as Professor Smith is, but in the long run much is lost by misrepresenting the views of such critics as Schmiedel, declaring the literary imagination of the Protevangelium of James worthy of Dante or Raphael, and pointing to Christian experience as "the supreme and incontrovertible evidence of the historicity of the Gospels." If it be true that "the final decision (in regard to historicity) rests not with the critics but with the saints," then Professor Smith's introduction to his own volume on the life of Christ is an offense to the Christian conscience. However good the purpose of the author may be, we cannot at all commend the method or contents of his volume as worthy of the subject or of his own brilliant powers. Such a defense only makes more apparent the necessity of critical study and reconstruction.

In the volume by Dr. Gilbert we have the most careful, complete and satisfactory attempt yet made in English to bring order out of the chaos of Gospel fragments left by literary and historical criticism and to give, on that basis, a strictly historic view of the life and work of Jesus.[3] The author's open-mindedness and sincerity are attested by the fact that less than fifteen years after the publication of his *Student's Life of Jesus* he has found it advisable to write a new work rather than to attempt bringing the former volume into line with present day knowledge. The contents of Dr. Gilbert's new book fully warrant the implied revolution in his view of the literary documents and in the results of his investigations. In the first part there are three compact but clear and reliable chapters on the various sources, including a statement of the results of Synoptic study, a discussion of the historical value of the Gospel of John, and a survey of the evidence in the Pauline letters. Then comes the main section of the book, in which is presented most sympathetically about all of the portraiture of the historical Jesus that can now be recovered. The Legendary Jesus is the title of Part III, wherein are treated the infancy stories, some of the miraculous elements, and the resurrection accounts, of the Gospels. The inclusion of these subjects under the term "legendary" does not mean that the author considers all pertaining to them to be unhistorical, but that the legendary elements in them have largely obscured the original facts. The whole book is scholarly and

[2] *The Historic Jesus.* Being the Elliott Lectures Delivered in the Western Theological Seminary, Pittsburg, Pa., by the Reverend David Smith, M.A., M.D., Professor of Theology in the McCrea Magee College, Londonderry. New York: G. H. Doran Co. $1.

[3] *Jesus.* By George Holley Gilbert, Ph.D., Leipzig University, D.D., Dartmouth College. New York: The Macmillan Co. $1.50.

reverent in tone, temperate in expression, and convincing in its reasonable expositions, a book to be carefully read and digested by those desiring the latest word of liberal investigation on the life of Jesus.

With less accuracy of statement, more vehemence in style, and some misconceptions of the sources, Rev. Charles S. Lester has sought to revitalize the figure of the historic Jesus by a study of the Synoptic Gospels as translated and arranged by Wellhausen.[4] While this work is more spicy and popular than that of Dr. Gilbert, it lacks the balanced judgment, scholarly grasp of materials and steady search for the truth which distinguish that author's admirable volume. Nevertheless, Mr. Lester has made a helpful contribution to the literature which aims primarily to make Jesus live in the historic imagination of men today as the carpenter of Nazareth, the religious teacher of Galilee and the victim of hatred and greed in Jerusalem. As for the religious result of such critical portrayals and estimates of Jesus, we believe that the reading of these studies with unbiased mind will strongly confirm Professor Gilbert's assertion that "the story of Jesus's life to be drawn from the sources after the work of criticism has been done is a story abundantly suited to inspire confidence in Him as the spiritual leader of mankind."

Modern French Artists

At the time when the art world is agog with mad modernism, the convenient little volumes of the series *French Artists of Our Day* (Lippincott, $1 each) ought to prove highly popular. The three books before us deal with realists and impressionists. Gustave Courbet is the subject of a study by Leonce Benédite:

> He was anathema to his generation, and he forced himself upon its judgment with all the weight of his loud voice, self-importance, and his intolerable and overweening vanity. . . . He had an enormous and rather gross appetite for fame, a Pantagruelesque thirst for glory.

Courbet was as insistent a self-showman as Bernard Shaw today; and less entertaining. Yet he was "the 'painter' par excellence, and the finest painters of our time have," writes M. Benédite, "derived their finest inspiration from him . . . men like Manet, Fantin, Legros, Whistler, Monet, Renoir, Carolus-Duran, Ribot, Stevens, and many others." The "notes" supplied by MM. J. Laran and Ph. Gaston-Dreyfus are embroideries upon the text furnished in numerous reproductions from the work of this painter—here described as "one of the three great artistic leaders of the latter half of the nineteenth century."

The brief account of *Edouard Manet* in this series is by Louis Hourticq; the notes are contributed by Jean Laran and Georges le Bas. Hardly had the last century recovered from the hubbub about the romantics, writes M. Hourticq, "when Courbet set Paris by the ears with his aggressively vulgar peasants"; and this uproar had scarcely abated when "Manet brought confusion worse confounded":

> His pictures met with practically nothing but laughter and derision. He encountered even more violent disapproval than even Courbet had done. . . . It was objected of Courbet, "There are such men and such things, but why paint them?" Of Manet it was said: "No, things are not like that. You're laughing at us." And for thirty years Manet stuck to his guns and went on obstinately showing his work to an indifferent and incredulous public.

It is the critics' failure to appreciate such a painter as Manet in his day that has sapped their courage in later times, and renders some of them loath to condemn the distortions and perversities of the futurists. But M. Hourticq, who is a thorogoing conservative, has the courage to deal honestly with Manet himself. "Very rarely," he writes, "has there been such a combination of audacity and uncertainty. His audacity came from the sincerity of his vision, his uncertainty from the inadequacy of the medium." M. Hourticq considers that today, "now that the fireworks of the great impressionists have begun to go out," painting is returning to solid modeling "and dark shadows which accentuate facial character and prevent faces from being dissolved into the light."

Puvis de Chavannes has for his biographer and critic André Michel, and J. Laran furnishes notes on the reproductions of his paintings. This idealist among modern painters has in M. Michel a most appreciative interpreter—tho the little essay makes less stimulating reading than the less amiable one by M. Hourticq, just noticed. This is a most welcome collection, and the generosity with which plates are furnished (forty-eight in each volume) is a point in its favor. The work of translation has been inefficiently done.

[4] *The Historic Jesus.* A Study of the Synoptic Gospels. By Charles Stanley Lester. New York: G. P. Putnam's Sons. $2.50.

George Gissing

Messrs. E. P. Dutton & Co. issue a fine new edition of *The Private Papers of Henry Ryecroft,* beautifully printed on hand-made paper ($1.50). It is an edition that Gissing would have been the man to appreciate, had he lived to see it. But if the novelist were here in the flesh he would be rather less pleased to find himself the subject, also, of a book by another English writer of whom he saw a good deal, Mr. Morley Roberts.

In *The Private Life of Henry Maitland* (Doran, $1.25) Mr. Roberts represents his friend Gissing as "Maitland"—just as he renames H. G. Wells "Rivers." And the new book has a double interest—literary and ethical. It not only throws light upon the character and career of one of the most gifted English novelists of the nineteenth century, it also shows clearly how that character foredoomed a disastrous career. George Gissing was a man who sneered at decency and flouted the established moral code, who hated Christianity and defied the laws of the land, yet when he suffered from the direct consequences of his wrongdoing, imprisonment, poverty, degradation, misery, disease and premature death, he at no stage of his life realized that he was in any sense responsible for his misfortunes. He meant well, was kind-hearted and self-sacrificing, and therefore what he did was right and the rest of the world was wrong; that was the way he looked at it, and his biographer apparently takes the same view. Neither of them shows any perception of the fact that the law of cause and effect holds in the moral world as it does in the physical.

GEORGE GISSING
From the lithograph by William Rothenstein--Courtesy of Messrs. E. P. Dutton & Co.

Readers have often wondered at the atmosphere of unmitigated gloom that pervades all of Gissing's works. They will understand it when they read this book. The real wonder is how a man under such conditions could write as well as he did. Mr. Roberts states his point of view in the following words:

> It is perfectly possible, and even certainly true, that many of the most pessimistic writers are in reality optimists. They show us the grey in order that we may presently make it rose. But Maitland wrote absolutely without hope. He took his subjects as mere subjects, and putting them on the table, lectured in pathology. He made books of his dead-house experiences, and sold them, but never believed that he, or any other man, could really do good by speaking of what he had seen and dilated upon. The people as a whole were vile and hopeless. He did not even inquire how they became so. He thought nothing could be done, and did not desire to do it. His future was in the past. The world's great age would never renew itself, and only he and a few others really understood the desperate state into which things had drifted.

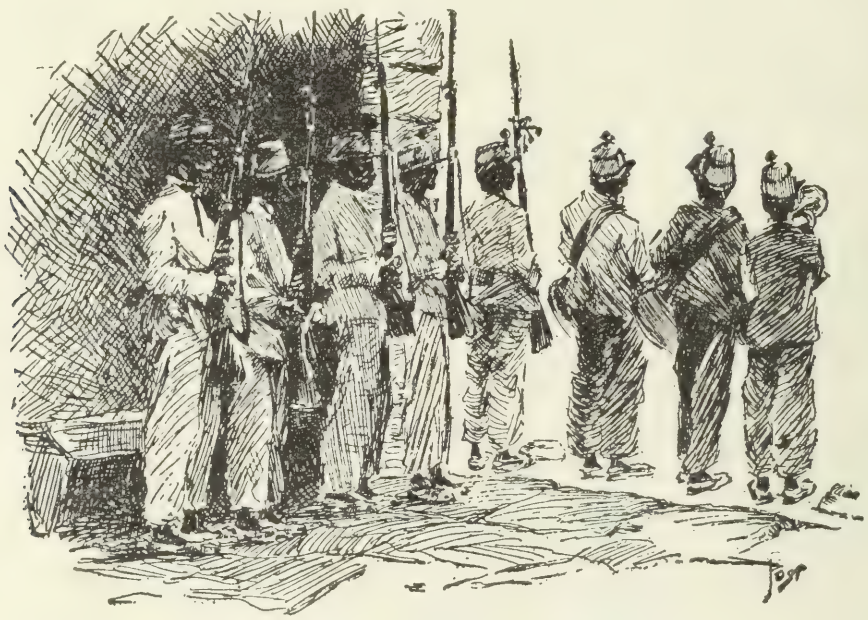
Our Colonial Newspapers

There is no field too forbidding to the candidate for the doctorate of philosophy. If it is not forbidding, indeed, the chance for turning over new material in plowing it is by so much diminished. Dr. Elizabeth Christine Cook has chosen for her investigation *Literary Influences in Colonial Newspapers,* 1704-1750 (Columbia University Press; Lemcke & Buechner; $1.50), yet she is fully aware that literature of any sort, in the American colonies, "was produced chiefly by ecclesiastics and by extremely practical men of affairs." Few books reached those of our ancestors who lived in the first half of the eighteenth century. But that, she argues, made the news sheet, badly printed as it was, all the more important and welcome. The colonial editor was, all the same, badly handicapped. His news service was beneath contempt. Political criticism was a dangerous field, for it might very easily cost him his editorial privilege, or a libel suit. So he fell back upon essay writing on the Addisonian model, or reprinted part of the contents of

his own library. Entire numbers of the *Spectator* were reproduced; the play, *George Barnwell*, appeared serially in the *New England Weekly Journal*; Pope, Butler and Dryden were standbys. And when these authors were not reprinted they were imitated.

The currents in Boston, Philadelphia, New York and Southern newspaperdom are diligently followed by Dr. Cook, who has, therefore, much to say of Franklin and his journalism. The only foreign influence, unless one so considers that of English letters, is the French, noted only at Charleston, S. C. The list of newspapers published in the first half of the eighteenth century, which terminates the work, does not purport to be exhaustive. "The authoritative bibliography of all colonial newspapers will be published by the American Antiquarian Society," we read. In the meantime we have John Van Ness Ingham's Check List of *American Eighteenth Century Newspapers in the Library of Congress*, issued by the Government Printing Office (50 cents).

Across the Andes



When the reviewer was a boy it was Africa that furnished all the thrills left over when he had read about the Indians and Arctic exploration. Now that the Poles have been ringed and Darkest Africa surveyed, South America is the favorite field for venturesome explorers like the author of *Across the Andes*, Mr. Charles Johnson Post (Outing, $2). His book is pleasantly personal and leisurely, with life enough in its style and events, and describes voyages and wanderings between the Pacific Coast of the continent to our south and the Amazon headwaters. Shooting of rapids, portages, banditti, savages, hunts, jungles, mule-back rides; these are some of the constituents of a bona-fide travel-book.

Teacup Troubles

"It was only a tempest in a teacup, but if you happen to live in the teacup"—is the appropriate explanation of many of the incidents in Mr. E. F. Benson's latest novel, *Mrs. Ames* (Doubleday, $1.35). This story offers a delightful picture of middle class English society, just touching the fringes of the "County."

Mrs. Karin Michaelis Stangeland and others have familiarized us with an alleged *Dangerous Age* for women, and Mr. Benson draws a cognate inference that there is a dangerous age for men also, when they feel that youth is slipping away from them, and they are haunted by the suspicion that life has not been sufficiently generous to them in romance. *The Roaring Forties* may come to have an ethnological, not to say ethical, meaning, as well as a nautical one.

With all the materials for domestic tragedy at hand, Mr. Benson is obliging enough to give us instead an exquisite comedy of manners and a memorable portrait of a woman. And he interests us deeply in his heroine, even after describing her as "a small, good-looking toad."

BOLIVIAN SOLDIERS ON GUARD
From one of Charles Johnson Post's drawings to illustrate his book "Across the Andes" (Outing Publishing Co.).

The Technique of Painting

To the painter and critic, and especially to the young art-student laying the foundations of his craft, *The Technique of Painting*, by Charles Moreau-Vauthier, should prove invaluable; to the intelligent amateur its fund of technical information and anecdotes should prove absorbingly interesting. (Putnam, $3.50.) It is delightfully and clearly written, as is the case with so many French technical works; and adequately translated. Etienne Dinet contributes the preface.

Books of the Springtime

It is our custom to announce at this season some of the more important books about to make their appearance in the stalls and on library shelves. We hope that we shall not pass over in silence anything of high significance: but nothing like completeness is claimed for these notes. Remember, please, that the value of a birds-eye view depends upon breadth rather than minuteness.

ART

The international exhibition in New York has introduced the strange work of Vincent Van Gogh into America, so that his vaunted *Letters of a Post Impressionist* should prove the sensation of the season. The publishers of this correspondence, the Houghton-Mifflin Company, issue also *The Engravings of William Blake*, a critical study and catalogue raisonné, by Archibald G. B. Russell. John Lane publishes a special collection of papers from the *Studio* entitled *Modern Etchings, Mezzotints, and Dry-Points;* also *The Van Eycks and Their Art*, by M. Brockwell and W. H. J. Weale. D. Cady Eaton's *Handbook of Modern French Sculpture* is listed by Dodd, Mead & Co. H. C. Shelley describes *The Art of the Wallace Collection* (L. C. Page). What James Huneker writes is almost always diverting; so we look forward to enjoying his book called *The Pathos of Distance* (Scribner). A volume of essays by H. R. Poore is entitled *The Conception of Art* (Doubleday). The Princeton University Press is announcing *Della Robbias in America*, by Prof. Allan Marquand, and *Problems in Periclean Buildings*, by Prof. G. W. Elderkin. Additional titles in the same series of "Princeton Monographs in Art and Archæology" are *The Red Relief Ware of Cervetri in Etruria; Lost Mosaics of Rome; Cassone Paintings and Other Furniture Panels of the Italian Renaissance in America*—the last named by F. J. Mather, Jr.

BIOGRAPHY

John Muir tells *The Story of My Boyhood and Youth* (Houghton). John Bigelow's *Retrospections* are concluded in volumes four and five (Doubleday). *James Fenimore Cooper* is at length made the study of an exhaustive biography, by May E. Phillips (Lane). Lewis Melville presents the *Life and Letters of William Cobbett*, in England and America (Lane). Henry James is autobiographic in *A Small Boy and Others* (Scribner). Scribner, again, publishes *Letters of General Meade* and *The Life and Letters of John Paul Jones* (by Anna de Koven). Bobbs Merrill Co. announce a *Life of Thaddeus Stevens*, by J. A. Woodburn. *A Chronicle of Friendship*, a title already used by Will H. Low, appears in the Stokes announcement with the name, Luther Munday, attached. The author is not yet one of *our* friends, but he is characterized as a Briton of varied experience. *Heroines of Modern Progress* are described by E. C. Adams and W. D. Foster, the second of whom edits also *Heroines of Modern Religion* (Sturgis). Mrs Isabel C. Barrows, widow of the journalist and penologist, narrates *A Sunny Life: the Biography of Samuel June Barrows* (Little, Brown). *King Edward in His True Colors*, by Edward Legge, is said to be a frank and enlightening biography of "The Peacemaker" (Small, Maynard). Robert W. Carden lets the great Italian tell his own story in *Michaelangelo: A Record of His Life*, founded on the letters and papers of Michaelangelo himself (Houghton). Among the Dutton offerings is Charles Whibley's book of *Essays in Biography*. J. Fitzmaurice-Kelly, an authority where Spain is concerned, writes the *Life of Miguel de Cervantes* (Oxford Univ. Press).

CRITICISM

A series, Channels of English Literature, is announced by Dutton. Here will appear *The English Novel*, by George Saintsbury; *English Lyric Poetry*, by Ernest Rhys; *English Criticism*, by Prof. J. W. H. Atkins; *English History*, by Prof. Richard Lodge; *The English Essay*, by Prof. Hugh Walker; *English Satirists and Humorous Literature*, by Oliphant Smeaton; *English Elegiac, Didactic and Religious Poetry*, by Dean Beeching, and *English Dramatic Poetry*, by Prof. Felix E. Schelling. Professor Schelling contributes also to one of the Houghton Mifflin collections an essay on *The English Lyric*. This latter publisher issues, also, *Goethe's Key to Faust*, by W. P. Andrews, and P. E. More's *Drift of Romanticism*. J. M. Kennedy offers a history of *English Literature, 1880-1905* (Small, Maynard). A translation of André Chevrillon's *Philosophy of Ruskin* is issued by Dutton. Dr. Albert Gubelmann has made *Studies in the Lyric Poems of Friedrich Hebbel*, and Prof. C. M. Lewis writes of *Gawayne and the Green Knight* (Yale). William J. Long has essayed to write a truly "national" *American Literature* (Ginn).

ECONOMICS AND SOCIOLOGY

Syndicalism and the General Strike are explained by Arthur D. Lewis (Small, Maynard), while *Syndicalism, Industrial Unionism and Socialism* are expounded by John Spargo (Huebsch). John Graham Brooks discusses *American Syndicalism: the I. W. W.* (Macmillan). André Tridon's *The New Unionism* also treats of Syndicalism, while Allan L. Benson tells *The Truth About Socialism*. Both these books are published by Huebsch. *Marriage and the Sex Problem*, by F. W. Foerster, is on the Stokes list. *Work and Life* is a plea for coöperation by Prof. I. W. Howerth (Sturgis). *Gold, Prices and Wages* is an essay on the increased cost of living by J. A. Hobson (Doran). *The French Revolution of 1848 in Its Economic Aspects* (Oxford Univ. Press) is in effect Louis Blanc's *l'Organisation du travail* and E. Thomas's *Ateliers nationaux*, edited with an introduction. There is a wide market for the books of Orison Swett Marden, of which three are announced by Crowell (*The Progressive Business Man; The Exceptional Employee; The Joys of Living*); and tho they are scarcely to be classified under the head "Economics," they are certainly directed at the 'business man." *Advertising as a Business Force* is set forth by Paul T. Cherington, of the Harvard school of business administration (Doubleday). Volume one of Prof. C. A. Beard's *Economic History of the United States* is a Macmillan book.

EDUCATION

Prof. A. D. Weeks grapples with the problem of vocational teaching in *The Education of Tomorrow* (Sturgis). Prof. F. W. Smith gives to his book, *The High School*, the sub-title "Whence and Whither" (Sturgis). Ellen Yates Stevens's *Guide to the Montessori Method* is promised by Stokes, Dr. Montessori's own publishers, who announce also the Italian educator's *Pedagogical Anthropology*. The revised and expanded edition of Dr. F. M. McMurry's report to the New York Committee on School Inquiry is entitled *Standards for Elementary Schools* (World Book Co.). Silver, Burdett & Co. announce books on *What the Children Study and Why?* and *Psychology as Applied to Education*. Dr. Irving King examines *The Social Meaning of Education* (Appleton).

FARMING AND HUSBANDRY

The Call of the Land, by E. Benjamin Andrews, and a *Catechism of Agriculture*, by Prof. T. C. Atkeson, are announced by the Orange Judd Co. *Constructive Rural Sociology* is studied by Prof. J. M. Gilette (Sturgis). John A. Craig and F. R. Marshall collaborate on *Sheep Farming* (Macmillan). In Lippincott's series of Farm Manuals appear Dr. C. W. Gay's *Profitable Horse Husbandry*, G. E. Day's *Productive Swine Husbandry*, and H. A. Lewis's *Pro-*

ductive Poultry Husbandry. To Macmillan's Rural Science Series is added *Sheep Farming in North America,* by the late John A. Craig. *Modern Strawberry Growing,* by Prof. A. E. Wilkinson, is a Doubleday book. F. I. Anderson writes of *The Farmer of Tomorrow* (Macmillan).

FICTION

Anatole France makes his appearance in English at a "popular" price, and the first volume to appear in the new edition is *The Gods Are Athirst* (Lane). The same publisher issues W. J. Locke's *Stella Maris,* and Karin Michaelis Strangeland's *The Governor.* Jeffery Farnol's new novel is called *The Amateur Gentleman* (Little, Brown). Father Hugh Benson in *Come Rack! Come Rope!* tells a tale of religious persecution under Elizabeth (Dodd). The publishers of *Queed,* Houghton Mifflin Company, announce a new Harrison book: *V. V.'s Eyes.* The business adventures of Emma McChesney are given by Edna Ferber the appetizing title, *Roast Beef, Medium* (Stokes). Newfoundland is the scene of Theodore G. Roberts's *Harbor Master* (L. C. Page). Lawrence Perry turns to the Spanish American War for his *Holton of the Navy* (McClurg). Henry Bordeaux's *The Fear of Living* appears with an introduction by René Doumic, and is translated from the 74th French Edition. Anne Douglas Sedgwick, who gave us *Tante* in 1912, has written *The Nest* (Century). Short stories by Owen Johnson are entitled *Murder in Any Degree* (Century). Booth Tarkington's *Flirt,* Mary Austin's *Green Bough,* Mrs. Humphry Ward's *Mating of Lydia,* Ellen Glasgow's *Virginia;* these are some of the Doubleday-Page novels. Winston Churchill's novel, *The Inside of the Cup,* is now announced by Macmillan. Jacques L. Morgan's *Coup d'Etat* is described as "the political novel of 1913" (Fenno). John Luther Long in *War* returns to the theme of the civil conflict (Bobbs). George Gibbs signs *The Silent Battle,* a story of the Maine woods (Appleton).

HISTORY AND GOVERNMENT

C. G. Bayne, C. S. I., reports on *Anglo-Roman Relations, 1558-1565* (Oxford Univ. Press). E. A. Vizetelly's *Republican France* is a promising contribution to the record of the four last generations (Small, Maynard). Earlier French history is treated in Joseph Turquan's *The Empress Josephine* (Lane), Augustin Filon's *Prince Imperial* (Little, Brown) and the *Memoirs of the Marquise de Custine,* by Maugras and Croze-Lemercier (Doran); the last named lady being an unwilling subject of the first Empire, and a Royalist of the two Restorations. *Napoleon's Correspondence* (three volumes) is a Duffield publication. *The Windham Papers* include correspondence of significance in English history (Small, Maynard). *England in 1815* is a contribution by Joseph Ballard to the Houghton-Mifflin list, which includes also H. W. Van Loon's *Fall of the Dutch Republic.* More modern in subject is Captain Granville Baker's *Passing of the Turkish Empire in Europe* (Lippincott). *Pickett and His Men,* by Mrs. La Salle C. Pickett, is issued by the same Philadelphia publisher. *The Framing of the Constitution,* by Prof. Max Ferrand, has the Yale imprint. Dr. Lyman Abbott's *America in the Making,* a contribution to the Yale University Press series on the Responsibilities of Citizenship, belongs, perhaps, to interpretive history. Dr. F. A. Cleveland talks of *Organized Democracy* (Longmans). Brand Whitlock, mayor of Toledo, debates *The Enforcement of Law in Cities* (Bobbs). *The Philippine Problem* is approached by Frederick Chamberlain (Little, Brown). Other governmental problems are discussed by Frank Koester in *The Price of Ineffiency* (Sturgis). M. Garcia-Calderon's *Latin America* has been reviewed in THE INDEPENDENT as a French book; in English it appears from the Scribner press. *United Italy* is the subject of F. M. Underwood (Doran). Prince Lazarovich-Hrebelianovich, of Servia, seeks to elucidate *The Orient Question* (Duffield). *The Economic Utilization of History,* by Prof. H. W. Farnam, is a Yale Press issue. *Australia* is the text of A. Wyatt Tilby (Houghton). Prof. Carlton Hayes discusses *British Social Politics* (Ginn).

OUTDOOR BOOKS

The Outing Publishing Company reminds us of the season in announcing *Fishing with Floating Flies,* by Samuel G. Camp; *The Fox Terrier,* by Williams Haynes; *Out with the Birds,* by Hamilton M. Laing: *The Gasoline Motor,* by H. W. Slauson; *Yacht Cruising,* by C. Worth; *The Art of Golf,* by J. Taylor, and *Suburban Gardens,* by Grace Tabor. Doubleday, Page & Co. issue *The New Gardening,* by W. P. Wright: *The Book of Useful Plants,* by Julia Ellen Rogers. Jessie P. Frothingham lays down the principles of *Success in Gardening* (Duffield). Charles G. Davis's *Motor Boating for Boys* is a Harper issue.

PLAYS AND PLAYMAKING

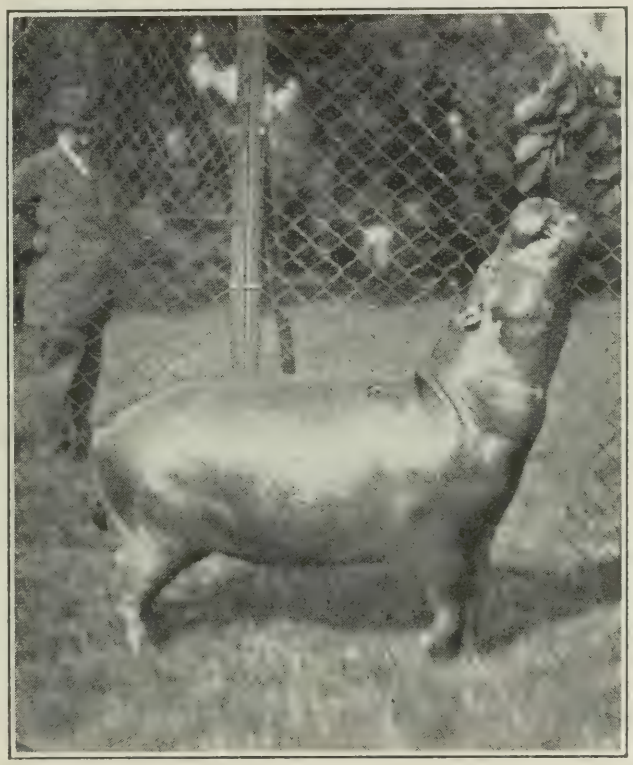
We note on the list of announced plays nothing remarkably promising, but there is plenty in the way of theorizing, as such books as Gordon Craig's *Towards the New Theatre* (Dutton), Elizabeth R. Hunt's *The Play of Today,* studies in dramatic structure (Lane), John Palmer's *The Censor and the Theatres* (Kennerley), and Henry Arthur Jones's *Foundations of a National Drama* (Doran), attest. Actual plays are Cosmo Hamilton's *Blindness of Virtue* and H. A. Vachell's *Jelf's* (Doran, both); Lascelles Abercrombie's *Deborah* (Lane); E. D. Schoonmaker's *The Americans,* Harry Kemp's verse *Judas,* and W. O. Bates's *Jacob Leisler* (Kennerley). Katrina Trask's *In the Vanguard* is a peace-movement drama (Macmillan). There continues to be competition in the translation of Strindberg's plays; besides M. Björkman's excellent renderings (Scribner), and Mrs. Howard's (Stewart & Kidd), we note the entry of Ellie Schleussner into the competition, translating this time, however, the "curious autobiographic novel," *The Confession of a Fool* (Small, Maynard). Meanwhile Putnam promises another "autobiographical novel" by the mad dramatist: *The Inferno,* translated by Claud Field.

RELIGION AND PHILOSOPHY

Dr. C. F. Kent's *Life and Teachings of Jesus* is an important Scribner publication, as is F. von Hügel's *Eternal Life.* Dr. J. C. Fraser's Gifford lectures are entitled *The Belief in Immortality and the Worship of the Dead* (Macmillan). Father Benson will publish the *Confessions of a Convert* (Longmans). *Religious Unrest and Its Remedy* are discussed by J. A. Anderson (Revell). *Christianity and Commerce* occupy Rev. F. I. Paradise (Dodd). In the International Leaders' Library (Revell) appears the story of Home Missions, *Leavening the Nation,* by Dr. Joseph Clark; while Prof. Giovanni Luzzi's *Struggle for Christian Truth in Italy* is, likewise, a Revell book. Sir Oliver Lodge examines *Modern Problems* (Doran). *Some Influences of Modern Philosophic Thought,* lectures by President Hadley, is published by the Yale University Press. Josiah Royce's recent lectures at Oxford are to be published under the title, *The Problem of Christianity* (Macmillan). *Prayers, Ancient and Modern,* are the subject of a book by Prof. W. A. Knight (Dutton). Dr. G. S. Payson writes of *The Virtue and Victorious Faith of Christ,* and Dr. D. L. Leonard of *A Hundred Years of Missions* (Funk & Wagnalls).

TRAVEL

A born vagabond, with a knack for turning vagabondage to account, is Harry A. Franck, who has visited Panama and written *Zone Policeman 88* (Century). A reading alone can prove whether Cecil Headlam's *Provence and Languedoc* is properly history or travel (Doran). *Castles of England and Wales,* by H. A. Evans, and *A Farm in Creamland*—Devon, are other books with the Doran imprint; and so is M. P. Price's *Siberia.* Adelaide Mack celebrates *Magnetic Paris* (Bobbs). *The Russian Empire of Today and Yesterday* is by Nevin O. Winter (L. C. Page). Lane publishes *Down the Mackenzie and Up the Yukon,* by E. Stewart; *Austria,* by James Baker, and *The Old Gardens of Italy; How to Visit Them,* by Mrs. Aubrey le Blond. W. D. McCracken writes of *The Spell of the Italian Lakes* (L. C. Page). Kate F. Kimball tells of *An English Cathedral Journey* (Crowell). W. R. Castle, Jr., writes of *Hawaii, Past and Present,* and J. J. Underwood of *Alaska, an Empire in the Making* (Dodd). A. E. Bostwick depicts *The Different West* (McClurg).



VERSE

In April Alfred Noyes's *Complete Poetical Works* will be issued by Stokes; somewhat earlier they will publish his verse *Tales of the Mermaid Tavern.* Small, Maynard & Co. announce *Ripostes,* by the young American expatriate, Ezra Pound. The collected work of the Australian poet, Adam Lindsay Gordon, is published by Dodge. Kennerley issues Charles Hanson Towne's *Quiet Singer.*

SURVEY of the WORLD

A Treasure from the Jungle

The most costly, and scientifically the most noteworthy, animal in the grand collection of the New York Zoological Society in Bronx Park is the pigmy hippopotamus, of which there are three specimens. Not only are these the only living examples in this country, but anywhere in the world, except a pair captured at the same time and now in Europe. Even skins and skeletons are so few as to be regarded as great prizes by museums. In fact, this diminutive hippo was practically unknown until the indefatigable German, Hans Schomburgk, an agent of Carl Hagenbeck, of Hamburg, hunted the animal to its lair in the jungles of Liberia, and in capturing five individuals learned somewhat of their habits. Its habitat is apparently restricted to the hinterland of Liberia, where it roams restlessly thru the forests and haunts small streams, making resting-places of hollows under the shaded banks. This rare little beast from an unknown land is a true hippopotamus, but a midget in size beside the huge amphibian with which we are familiar. One might make a dozen of them out of the bulky carcass of that old Behemoth Caliph, the monarch of the herd at the Zoo. The male of the pigmy is fully adult, yet stands only 30 inches tall, and weighs about 420 pounds, while the others, less mature, are far smaller. In addition to this great disparity in size, the pigmy differs from the ordinary hippo in many features. Its legs are longer and more slender, its tail much longer in proportion, the head is smaller, and there is but one pair of tusks (canines) in the lower jaw. That this animal is mainly terrestrial in its manner of life is indicated by the more forward and lateral position of the eyes, whereas in the great river-horse they "pop" out of the top of the face, so that as the beast swims submerged, as is its custom, only the elevated nostrils and eyes "like two shiny glass marbles," as Dr. Hornaday expresses it, appear above the surface. These precious strangers are contented and thriving in their quarters in the elephant house, in company with the pigmy elephant and other interesting African quadrupeds steadily disappearing from that continent in its rapid exploitation. The two younger ones are very docile and friendly, but the old bull, whose portrait is here given, is inclined to be irascible and even vicious. His cage and tank are so near the pen of the gigantic African elephant that the two constantly exchange amicable greetings. It is amusing to watch these courtesies, when the elephant stretches his trunk out to the netting where the little hippo is waiting to greet its investigating tip with a polite tongue. Who knows what subtle meanings and memories of the tropical jungle they communicate in these mute touchings of noses? Do they chuckle over their knowledge of other secrets of animal life yet hidden under the leafy curtain of that mysterious land still so dark to the naturalist?

UNSATISFIED ASPIRATIONS

Even the hippopotamus of the Zoo with the body of an overfed dachshund has his longings for something higher than he.

Rotation of Diet

The Department of Agriculture reports more than 30,000 new vegetables and fruits imported for testing in this country; and already a very large part of these have become acclimated and adjusted to the soils of different parts of this country. THE INDEPENDENT recently noticed the dasheen, as a possible substitute for the potato, or at least supplementary to that important tuber. It looks like a striped potato, a trifle hairy and rough. It can be boiled or baked or fried, and makes a splendid stuffing for meat. It has a nutty flavor something like a chestnut, which will add greatly to its culinary value. It can be relied upon for 400 to 500 bushels to the acre. One of the very earliest of these new vegetables to come into use is the petsai, reaching us from China. It is nothing more than what the housewives call "greens"; but it is ahead of anything else of the kind in our gardens. It runs up tall leaf stalks, something like the stem of a beet leaf, or Swiss chard, and something also like a cabbage stem. It is said by all who have used it to be delicious. The tungshu nut also comes from China; looking something like an onion and pretty likely to win its way to great popularity. It has a delicious flavor, is very nutritive, and can be grown with the utmost ease. The list is a long one, at any rate, and our bill of fare for the common man's table is being enormously enlarged. It will cost no more to grow these things in our gardens, and in many cases will displace coarse and indigestible vegetables. Mr. Fairchild, who is at the head of the plant importation bureau, insists that the human appetite needs rotation of food a good deal as the soil needs rotation of crops. Both of these ends are accomplished by the adoption of some of the better importations.

The Pigmy Myth

The more we learn about the peoples of small stature, the less they seem to be handicapped by the mere matter of size. During the recent expedition of the Duke of Mecklenburg, an exploring party under Drs. Schultze and Milbraed encountered in Southeastern Kamerun tribes of pigmies, some of whom spoke the prevailing Bantu dialect, while others spoke a different language from any of the neighboring tribes. They were found engaged in an occupation which seemed singularly inappropriate to their physique. Far from seeking their quarry among "rats and mice and such small deer," their quest is the elephant, and they seek him not with traps and pitfalls, but openly and boldly and with thrusting spears.

It would be amusing if some one would get together the immemorial illusions in regard to pigmies which have persisted almost down to our day. The ancients undoubtedly knew actual pigmies, but that did not prevent their imaginations from running riot whenever the subject occurred to their minds. Travelers no doubt ran across tribes whose average hight was 4 feet or less, and travelers' tales would no doubt cut off a foot or two. Poetic license and literary emphasis disposed of another foot; and there are numberless references in ancient literature to a race of beings only a few inches high.

There is a passage in Juvenal which used greatly to scandalize the old commentators, because it referred to the "curved talons" of cranes. The fact that Juvenal in this passage represented the cranes as carrying off in their curved talons men a foot high did not scandalize anyone—not at least till our more skeptical times. They were quite sure that cranes could not have curved talons, but they were not sure that men could not be only a foot high. The authority in support of the latter fact was too impressive. Gifford thus translates the passage:

> —while pouncing on their prey
> The victor cranes descend, and, clamoring bear
> The wriggling mannikins aloft in air.

But Gifford, like all other English translators, from Dryden and Chapman down to the present day, always perverts Juvenal. Juvenal merely remarked in a calm and matter of fact way that the little man, being unequal to the contest, was carried off by the angry crane in his curved talons. Later Juvenal added that while Romans might be surprised if they saw such a thing and might laugh at it, people in that country took it seriously because all the rest of them were only a foot high.

The Newest Trolley Car

In our larger cities the problem of traffic congestion in the evening is a serious question. In an effort toward the solution of this problem, the Pittsburgh Railways Company began to give the matter of double deck cars consideration in the hope that it might prove a benefit. Every type of double deck car commercially known prior to this time, while offering the advantage of a larger seating capacity in a relatively small space, had the great disadvantage of exceptionally slow entrance and exit arrangements. In the hope that this difficulty might in some measure be removed, the Pittsburgh Railways Company began to experiment and finally hit upon the present car, No. 6000, which was constructed in its shops and placed in operation on the streets of

Pittsburgh on August 4 last. The general dimensions of this car are as follows:

Length over all, 48 feet; width, 7 feet; hight over rail, 14 feet; distance between bolster centers, 25 feet. Wheel, base of trucks, 4 feet 4 inches; hight of main deck of car over rail, 30 feet; hight of floor of second deck above rail, 7 feet 6 inches; hight of floor of center portion above rail, 17 feet. Estimated weight of car, 27,000 pounds. Seating capacity of car on the basis of allowing 17 inches per passenger on all longitudinal and cross seats, 112. Total capacity of car, 225 passengers.

The chief feature of this car is the design and arrangement of the entrance and exits, which are extremely novel, since the design not only separates the boarding passengers from the alighting passengers on the street, but separates the entering and leaving passengers within the car.

There is a stairway for the passengers entering the upper deck and a separate stairway for passengers leaving the upper deck. A passenger boarding the car finds himself immediately at the landing leading to the upper deck or to the passageways leading to the seating compartments on the lower deck.

A passenger leaving the upper deck and going down the exit stairway finds himself at the exit door ready to leave the car in one step. This extremely novel entrance and exit arrangement removes, it is believed, the principal objection to the use of a double deck street car, that difficulty being the long time required to take on and discharge passengers.

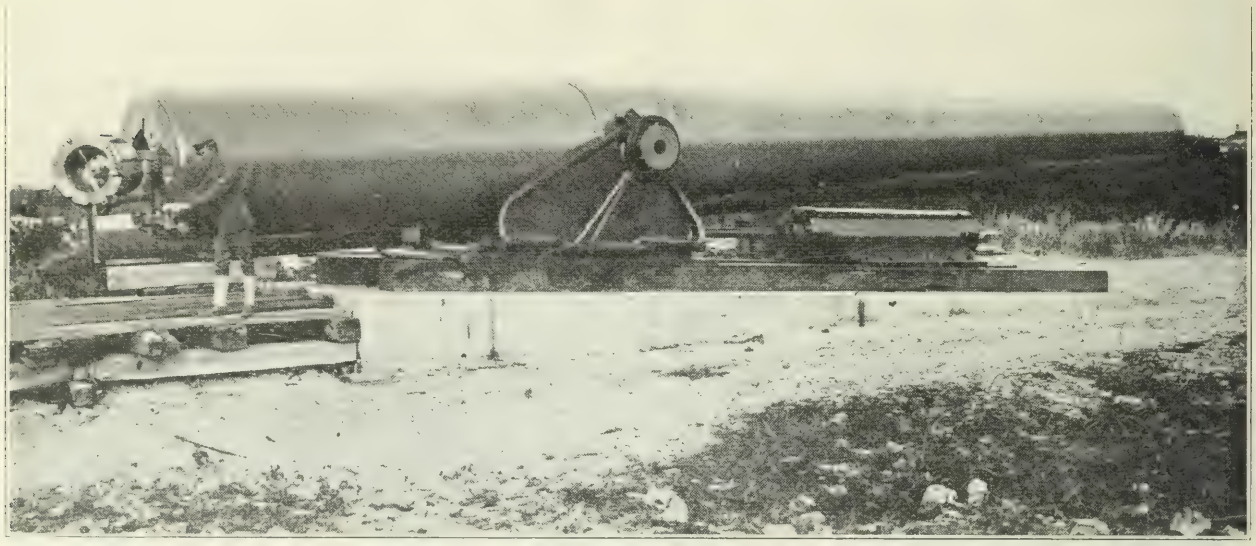
A study of the plans discloses the fact that the feet of a passenger taking a seat on the upper deck are only 40 inches higher than the feet of a passenger in a seat on the main floor of the majority of modern types of double truck motor cars, and the greatest distance necessarily traveled from the entrance door to any seat in the car, either on the upper or lower decks, is 22 feet, or no more than is required on the modern type of single deck car.

The car herein described has been running continuously in service since its first trip on August 4 last, and according to P. N. Jones, general superintendent, almost daily observations have been made of the time required for passengers to board and alight, and the reports of these tests show a surprisingly short time consumed. The proof of the proposition, however, is that in its daily service this train, consisting of a motor car and the double deck trail car, has always kept its place in the schedule. The car is operating on a line which has a schedule speed of 10.24 miles per hour, with an average of seven stops per mile. The three principal features contributing to the successful operation of this car in a schedule much faster than the ordinary city surface car schedule are the novel entrance and exit stairway arrangements, as well as the combined sliding and swinging door device, and low trucks.

AN URBAN STREET-CAR TRAIN
A distinct advance toward the solution of a difficult transportation problem.

Spotted Negroes

A most interesting case of spotted negroes has recently been reported in the *American Naturalist* by Mr. Q. I. Simpson and Prof. W. E. Castle. The "piebald" negroes have white areas on the body which are entirely lacking in pigment. In general the white areas are on the same parts of the body in all cases, altho there are individual differences as to the extent. In some of the cases the white area is almost entirely free from pigmented spots. In others there is a scattering of larger or smaller patches of pigment over the white area. Apparently all cases have a white region on the top of the head, where the hair is also affected, giving it the appearance of a white topknot. The white area extends down the middle of the face, out upon the chest and upper arms, and down upon the torso and in some cases to the knees. It also extends around on the



sides and back of the body, but never as far as the spinal column.

These spotted negroes, of whom there are two generations, are all descended from a spotted woman who was born in 1858 of normally colored parents. It is clearly a case of Mendelian inheritance, the spotted pattern being dominant to the unspotted. The spotted individuals are heterozygous for this "piebald" condition. By this is meant that, since one parent was normal and the other spotted, the offspring possessed a single "dose" of the spotted character. If both parents had been spotted then the offspring would have possessed a double "dose" and be termed homozygous (in hereditary parlance) for this condition. The heterozygous individuals mating with normal individuals should produce, according to the Mendelian laws of inheritance, equal numbers of spotted and unspotted children. This is what the pedigrees of this family show.

A number of these spotted individuals are in "dime museums," both in the United States and in Europe. All of the fifteen children born from the first spotted mother are still living, which proves the stock to be healthy and strong. Since their condition has an earning capacity it seems likely that the race will not die out. The authors speculate as to what the result would be in case two negroes not closely related but bearing the spotted character should marry and produce offspring. Some of the offspring probably would resemble "black-eyed whites," such as occur in animals. That is, they would have snow white skin and hair, but colored eyes. Or the individuals might have spotted areas as their parents, but with the pigmented areas more reduced.

Panama's Big Gun

The biggest gun in the world is appropriately designed to guard the biggest canal in the world and both are the property and handiwork of the United States Government. This enormous engine of death and destruction is a 16 inch breech-loading rifle, and is the first of a series of similar gigantic weapons which it has been proposed to build for seacoast defense of the United States.

MAY IT NEVER BE FIRED!
The Biggest Gun in the World to Guard the Biggest Canal.

The total length of this gun is 49 feet 2.9 inches, with a diameter of the rear portion of 60 inches, the forward part tapering from this diameter to 28 inches at the muzzle. The length of the main bore is 37 feet 4.5 inches, with a diameter of 16 inches. The cylindrical part of the powder chamber is 7 feet 5 inches long, with a diameter of 18.9 inches, and if smokeless powder is used it will require 576 pounds for a single charge, while if old powder is used 1176 pounds will be necessary.

The range and energy of this gun are far ahead of any other of the large caliber guns in existence. It is estimated that with a maximum powder pressure of between 37,000 and 38,000 pounds to the square inch, it will throw a projectile weighing 2370 pounds with a muzzle velocity of 2300 feet per second, developing a muzzle energy of 88,000 foot-tons.

The projectile of the gun measures 5 feet 4 inches in length and has a penetrating force in steel at the muzzle of 42.3 inches. The most marvelous feature of this death-dealing contrivance is its range, which is 21 miles.

Major James M. Ingalls, Fifth United States Artillery, has prepared a firing table which shows that this gun may create all

kinds of havoc 21 miles away with the proper angle of elevation. The trajectory of the projectile shows that in ranging this score of miles the shell would reach an elevation of about 30,500 feet. This is far greater than the maximum of any other gun up to the present time.

The Krupp gun's greatest exploit was a range of 12½ miles, which was obtained in the presence of the German Emperor, and the greatest hight reached by the Krupp shell was 22,000 feet. If Mount Blanc were placed on top of Pike's Peak the projectile of this 16 inch gun would clear the combined hights with more than the hight of the Washington Monument, or 590 feet, to spare.

The total weight of this American monster is 130 tons. What would happen to a vessel hit by one of its projectiles is beyond the power of description. The probabilities are that there would be no splinter left of sufficient size to tell whether the wreck had been a fishing smack or a battleship.

Wars and Rumors of War

The incumbency of the Elysée Palace, which is the Parisian White House, is today of more than usual significance from the French point of view. The President of the greatest European republic, like the President of the United States, is, nominally, commander-in-chief of the army and navy. While the presidency has been held by well-meaning nobodies, this part of the executive's duties has been lost sight of, as have other of his prerogatives; but with a strong man in office, in the person of Raymond Poincaré, and with a troubling presentiment of breakers ahead, a presentiment decidedly vague, yet sharpened by Germany's planning to spend $500,000,000 on her military establishment during the next year, everyone is coming to think of the President of the third Republic as a potential war President.

Let us hope, however, that nothing worse than excessive payments on new war equipment, and the increase of the term of military service in France from two to three years (three years having been the term until recently, when it was reduced), will be the only distressing incidents of the new Presidency. The enthusiasm of the French population in the face of increased taxes in money and conscription proves that patriotism is not dead in that country, and that the Socialist ideal has not yet completely permeated society; it shows, also,

THE LEADERS OF FRANCE

Raymond Poincaré, the newly elected President, is the central figure in the first row. The photograph was taken on the steps of the Hôtel de Ville, on the occasion of his first official call upon the municipal authorities of Paris. The other figures in the first row, from left to right, include Emile Loubet, an ex-President; Armand Fallières, M. Loubet's successor and M. Poincaré's predecessor, and, standing to the right of M. Poincaré, Paul Deschanel, President of the Chamber of Deputies. Just behind the new President stands Aristide Briand, the French Prime Minister, and to the left, behind M. Fallières, Antonin Dubost, President of the Senate.

that the people regard the international situation as indubitably grave. It is generally believed that the Government has secret information of plans by Germany for an attack—an attack in which Germany's allies, Austria and Italy, would share. If such a deplorable event took place, Russia would inevitably come to the assistance of her ally, and so might Great Britain, tho Great Britain has only an "understanding" with France, so far as is publicly known, and no defensive and offensive treaty. Moreover, England does not fight first-class Powers unless she is obliged to do so; and perhaps the feeling on the British side of the channel is a little less positively French than it was before the service of one Caillaux as French Premier, M. Caillaux serving as M. Poincaré's predecessor in that office, and apparently betraying the interests of his country to Germany, and indirectly risking those of France's friend the Briton, all in the interest of his own pocketbook.

The commercial side of modern wars and rumors of war is prominent today. As usual, the German armor plate and gun makers are held responsible for the appalling increases in the German armament now contemplated; and the preparations of France, Russia, and the other Powers are all made with a view to equalizing the German augmentations. A spirit of unrest has prevailed all over Europe since the astonishing success of the Balkan allies in the Turkish war. The balance of power has been somewhat disturbed by the events in Southeastern Europe: for the Balkan States hate Austria (Germany's ally) like deadly poison, and are Slavic in part, and certainly Russian in their general sympathies. Now that these Balkan nations have proved their mettle, these sentiments can no longer be ignored.

We are, however, far from expecting that a general war will result from all this. It is a favorite diversion of the European press, this discussion of the inevitable conflict; and the present situation is in most respects no more threatening than several others in late years, which have, according to that press, shaken the foundations of the temple of peace.

Artificial Diamonds

Moissan's method of making tiny diamonds by melting carbon in a mass of iron, which was then suddenly cooled, producing sufficient pressure on the still molten interior to crystallize some carbon, is well known. In the last year or two a new method has been developed by von Bolton. He discovered that hydrocarbons were reduced by sodium amalgam to carbon and obtained this carbon in a form suspiciously like diamonds. The problem was to secure larger crystals for identification. Since crystals tend to grow on crystals previously formed, von Bolton decided to use some diamond nest eggs. Accordingly he passed moist illuminating gas for a month thru a tube containing 14 per cent sodium amalgam and lined with a very fine suspension of diamond dust in water glass. The tube was kept at the boiling point of water. Under the microscope minute crystals could be clearly seen, and they showed all the properties of true diamonds.

Huerta and the Rebels in Mexico

Huerta's Government made no progress last week in the work of subduing the rebels. Thruout the northern States, and especially at points near the boundary, his opponents were active and as a rule successful, altho Governor Carranza, nominally their leader, was hard pressed in the eastern part of the border district. Sonora was wholly under rebel control, and it was said that the revolt had been organized in nine States. On the 10th the rebels captured Nacozari, and two days later, after a sharp engagement, they defeated the garrison at Nogales, which is separated from the town of the same name in Arizona by a street. There an American cavalryman was wounded by a rebel bullet, and at once the American commander ordered the opposing factions to cease firing. The Federals soon afterward crossed the line and surrendered to him. The series of rebel victories was broken by a defeat at Parral, in Chihuahua, and by another near Naco, on the border, where General Ojeda overcame a rebel force largely exceeding his own. But it was expected that eventually Ojeda must yield, as it was said that there were 8000 armed rebels in the north. The State of Sinaloa officially repudiated Huerta. Orozco arrived at the capital, having accepted Huerta's rule, and he was commissioned to negotiate with Zapata.

The widow and the mother of the late President Madero, with several relatives, arrived last week in New York, where twenty-five members of the Madero family are now living. It is said that the reports about the brutal treatment and mutilation of the late President, his brother, Gustavo, and the Vice-President, have been verified by American secret service agents. Much has been printed about an official dispatch in which Secretary Bryan commended Ambassador Wilson. It appears to have been signed perfunctorily by Mr. Bryan, immediately after he entered the Cabinet. The

American clergymen at the Mexican capital have signed a statement praising the Ambassador and deploring hostile criticism of his conduct in certain American newspapers. President Wilson's policy with respect to Mexico continues to be like that of his predecessor.

The Coming Session of Congress

It was decided last week that the special session of Congress should begin on April 7, as the tariff bills would not be ready at an earlier date. Mr. Wilson, it is understood, thinks that the work of the session should be confined to tariff revision, but he may speak of currency reform in his first message. It is the opinion of the Democratic leaders that the attention of Congress should not be diverted from the tariff by a currency debate. Mr. Bryan does not wholly agree with Mr. Underwood, the House leader, as to parts of the tariff. This was shown some time ago. But the Secretary of State will not, it is said, attempt to interfere. At the President's invitation, Senator La Follette has had an interview with him at the White House, and it is reported that the Democrats have reason to expect some aid from the Senator.

On the 13th, the Democrats formally assumed control of the Senate, making Mr. Clarke, of Arkansas, president pro tem., and electing a secretary and other executive officers. The election of Mr. Hollis in New Hampshire gives the Democrats fifty members. There are forty-four Republicans, and two vacant seats to be filled. The Democratic caucus committee has made assignments to the committees, which include a new one, on Banking and Currency. Mr. Owen, of Oklahoma, will be chairman of this. As Mr. Simmons, of North Carolina, was regarded as too conservative concerning the tariff, an effort was made to exclude him from the chairmanship of the Finance Committee, to which he was entitled by the rule of seniority, but he threatened to resign from the Senate, and the place was given to him. Mr. Tillman was entitled to be made chairman of the Appropriations Committee, but his wishes were not respected, and Mr. Martin has that place. Mr. O'Gorman, who approves exemption of our coastwise shipping from the payment of Panama Canal tolls, is to be chairman of the Committee on Interoceanic Canals. Reports sent to the Senate show that thirty-one of the required thirty-six States have ratified the constitutional amendment providing for direct election of Senators. It is expected that five will be added before the end of the present year.

Fifty Years Ago

From **The Independent**, March 19, 1863

EMIGRATION OF LANCASHIRE OPERATIVES

This paper was, we believe, the first to recommend a wholesale emigration of the starving operatives of Lancashire to the United States, as the best if not the only adequate remedy in the case. . . . One important point has begun to be gained, by the conviction which we find already spreading in England, that emigration is the only effectual remedy. The "ninety-days theory" that the Civil War in this country would be ended in three or six months, and that then the organization of Southern society for growing cotton by slave labor would be restored as it was, has begun to be rejected on both sides of the water. The evil effects of supporting a large population in idleness are becoming apparent, and will soon affect the springs of charity from which the means of doing it have been drawn. A writer in *The London Patriot* says:

"The true remedy is to assist these people to go to countries where their labor is wanted, where they will add to our strength and trade. Our colonies are crying out for population, and we are most inconveniently crowded at home. Employers in the north are no doubt against such a movement; but they cannot be allowed to keep a large population at starvation point for their convenience."

. . . The Emigrant Aid Society is ready to be formed as soon as intelligence from England shall seem to justify it. But we cannot go to England to bring the English people here, because of the English-built pirate ships which throng the Atlantic Ocean and destroy every American ship they meet.

Disestablishment of the English Church in Wales

The bill for the disestablishment of the Church in Wales, which was passed by the House of Commons on February 5, and promptly rejected by the House of Lords, is the second great measure—next after Home Rule—that is expected to become law thru the operation of the Lords Veto Act of 1911. Like the Home Rule bill, it was passed in the long drawn out session of 1912, which only came to an end on March 7. It is planned to pass it again early in the present session, which began after an interval of only a few days after prorogation, and, altho it may be rejected a second time by the Lords, it can become law without their consent early in 1914.

The English Church has never recognized the separate nationality of Wales, and the four dioceses into which Wales is divided form part of the Province of Canterbury. The bill provides that there shall be no change in this respect, and it also secures to the Anglican Church all the cathedrals, church fabrics and parsonages which have hitherto belonged to it. There was strong effort made in the House of Commons to retain also the glebe lands, but this was defeated by the smallest Government majority mustered on the bill. The total income of the Church in Wales in 1906—the year for which the figures were quoted by Mr. McKenna when he introduced the Disestablishment bill on April 23—was $2,730,000, of which $1,480,000 was derived from voluntary subscriptions, pew rents, and payments for christenings, marriages and burials. The income from endowments—tithes and land—was $1,300,000, and by the bill, as finally passed by the House of Commons, $600,000 was left unconditionally in the possession of the Church. In addition, the salaries of all present incumbents are to be kept at their present level out of the remaining endowments — a charge that leaves at the present time only $260,000 out of the endowments which Wales claims as national property for national uses. Eventually, as the present incumbents pass away, about $700,000 a year will become available. Of this $133,500 is to go to the University of Wales, and the remainder is to be handed over to the county councils of the areas in which the Church property or the tithed lands are situated.

The case for the disestablishment of the Church in Wales, as distinct from the case for disestablishment in England, is that the Anglican Church in Wales is the church of a small minority. There are about 2,000,000 people in Wales. The Nonconformist churches—Congregational and Methodist—provide sittings in their churches for 1,900,000; while the Anglican Church has sittings only for less than 500,000. Moreover, the Anglican churches draw few people in proportion to their seating capacity, and there are several districts where the endowments work out at more than $40 a year for each one of the church members attending the Established Church. Practically all the property that reverts to the nation was bestowed on the Church in the days before the Reformation, when it was truly a national Church, and it is the claim of the Welsh people that this property does not belong of right to an alien Church which has the adherence of less than 10 per cent of the people.

They're Hanging of the Cubists in the Morning

"What are the Cubists painting for?" said Critics-on-Parade.
"Can't make it out, can't make it out," the Art Reporter said.
"What makes you look so white, so white?" said Critics-on-Parade.
"I'm dreading what I've got to watch," the Art Reporter said:
For they're hanging of the Cubists, you can see the colors gay,
Green pyramids and yellow squares, they're hanging them today,
'Twould make you burst your buttons off, the things the people say.
And they're hanging of the Cubists in the morning.

"What makes the rear rank breathe so hard," said Critics-on-Parade.
"He thinks they're sold! He thinks they're sold," the Art Reporter said.
"What made that front-rank man fall down?" said Critics-on-Parade.
"That purple sun, that purple sun," the Art Reporter said.
They are hanging of the Cubists, and the crowds are marching round,
They've halted by what seems to be a Brainstorm done in brown;
And they'll swear in half a minute that they've hung it upside down.
Oh, they're hanging of the Cubists in the morning!

"What's that so black against the sun?" said Critics-on-Parade.
"They *say* it is a flight of stairs," the Art Reporter said.
"What's all that wreckage overhead?" said Critics-on-Parade,
"A 'cubic' nude is passing down," the Art Reporter said.
For they've finished with the Cubists, you can feel your hair's turned gray,
The visitors are in column, and they're marching them away,
Ho! the nervous ones are shaking, and they'll want their beer today,
After viewing of the Cubists in the morning!

—Edwin W. Goodwin.

ADVERTISING AFFIRMATIONS
BY GEORGE FRENCH

IX—An Adman's Spring Song

It is now a good season to think a little about the ethics of advertising, just as the spring is reminding us that Nature is putting on her new dress, and as those best products of Nature, the ladies, are putting themselves forth in spotless and radiant spring raiment. It is a very interesting and profitable employment for advertising men, this sitting down to take account of stock. It is most inspiriting—to look the field over and note the great and vital differences that have come into the record during the past five years; yes, during the past two years.

While there has come into advertising much that is for the best and highest good of business in general, and of general ethics also, there is, of course, the speck in the ointment. There has come to be almost too much protest against forms of bad advertising, and a certain smugness that is not nice. It became the fashion to talk much about honesty in advertising some two or three years ago; and it is now apparent that some of the talk was (and is) just talk. There is a great deal being claimed for this or that medium, or this or that commodity, to the effect that they are so good that butter will not melt in their mouths, to indulge in a figure of speech that is peculiarly inapropos. The stuff about guaranteeing the advertising appearing in certain periodicals is just advertising, nothing more; like the famous guarantee of a certain line of hosiery, it is for the consumption of those who are determined to be unsophisticated.

But there is also the genuine dreamer of dreams about advertising whose dreams are based upon a stratum of real facts that is growing more extensive and more solid every month. This man looks into the past and compares it with the present, and is comforted. He has a right to be. He is of the elect of the earth, because he is able to find in this age and generation so much that exalts his soul.

"I see that advertising is rapidly becoming the means of selling business honor," he muses, or remarks into the ear of a sympathetic friend. "It is putting good faith on the market. Why, just think what advertising was only a few years ago! Then it was keyed to catch suckers. Then nobody pretended to concern themselves with the welfare of the buyer. It was *caveat emptor* for everybody. Not only that: It was worse. It was the effort to deny to readers the privilege of looking out for their own interests. The person who trusted his interests to the tender mercies of an advertisement deserved to be 'done,' and more often than not he was.

"Now how is it? I am of the opinion that there is comparatively little advertising that is really fraudulent, and but a small proportion that is consciously deceptive. And the virtue that now shines out of advertising is not a calculated virtue—not all of it, at least. Much of it is for revenue only, but has some negative merit at that. Let a man be honest and there is less thievery, even if he is a follower of that rather foolish fetish which says that 'Honesty is the best policy.' Such honesty does not build the spiritual life of the practitioner very much, nor does it operate to diminish the heedless buyer's honest store of coin."

These men are to be met everywhere that advertising men congregate. The vast significance of the fact that more business may be done if the Golden Rule is the business guide than if *Caveat Emptor* is the shibboleth, is being driven into the brains of more and more people. It has got a firm hold of the imaginations of the big and vital advertising men. Is it not fine that now we are assured that the big advertising man is he who banks upon the broad and fine doctrine that it is better to treat the man to whom he wishes to sell like a brother rather than like a dupe?

The big advertising man of today tries to sell service, honor, brotherhood in trade. He has found that it is more profitable; but that must not be allowed to degrade the ethical value of the policy, but rather to raise the practical value of business. The meeting of ethics and trade, in the advertising arena, signifies the elevation of business, not the degradation of the moralities.

This change in the character of advertising is surely the most significant phenomenon in business that the twentieth century has given us. It has not only already radically changed the character of advertising, but its influence has extended into every branch of business, into the realms of sociology, ethics, morality, and even into religion. It is a task for the most unfettered imagination to dare to estimate the ultimate consequences of this new policy.

IN THE INSURANCE WORLD

BY W E. UNDERWOOD

Failure of the American Union Fire

Fire underwriters generally were amazed early last week to learn that the American Union Fire Insurance Company of Philadelphia had been placed in the hands of a receiver. It was suspected that the company was in financial difficulties, but it was not thought that the case was as bad as the appointment of a receiver always indicates. An examination of the company's affairs by the insurance departments of New York and Pennsylvania had progressed far enough to reveal a state of serious insolvency, but the precipitancy with which the action for a receivership was taken would seem to be a proper subject for subsequent investigation. On the face of the statements describing the conditions in the American Union office, there was nothing to warrant the conclusion that policyholders could not be secured against serious loss, and yet that result now seems inevitable, even under the Insurance Department of Pennsylvania as liquidator as successor to the receiver, who has resigned.

The departmental examinations show that the financial report as of date December 31, 1912, sworn to and put out by the management of the company, was grossly false. Instead of possessing assets of $1,230,736, as claimed, they are now found to be approximately $603,000, plus $456,000 uncollected premiums which, now that the company is a failure, are nearly or quite worthless. The elimination of the policies represented by those premiums will have the effect of making a slight reduction in unearned premium liability, but not enough to do any good. It was also found that the company was undercharged a total of $255,000 on its unpaid loss and unearned premium accounts—$143,000 on the first and $112,000 on the latter. Instead of an unearned premium liability of $536,476, that item is now estimated at $680,000 and the charge for unpaid losses should be $173,000 instead of $60,495.

When the directors of the company, most of whom probably know little of the practical side of the fire insurance business, learned the serious condition of affairs, they proceeded to remove James F. Stone, who is somewhere in Europe, from the presidency and to adopt measures that would result in raising sufficient additional money to discharge all the company's obligations to policyholders. It is understood that negotiations were under way with a strong New York company to assume all the outstanding policies and that the funds necessary for this purpose had been all but pledged when the receivership proposition was sprung by some one on the inside. It is understood that pledges aggregating $188,000 had been secured and that suddenly all plans were altered and receivership proceedings put thru in an incredibly short time.

Calculating on the data before us, supplemented by the information commonly extant respecting the proposed reinsurance of the policies in a New York company, we conclude that all the policy liability of the American Union could have been transferred at a cost of about $475,000, net. There seem to be sound assets of about $600,000, which, added to the $200,000 the directors were about to raise, would have enabled the company to protect its policyholders against loss of their unearned premiums and leave a balance of about $300,000 with which to meet claims for unpaid losses and other major obligations. As it is now, unless the unexpected happens, the policyholders cannot hope to escape a heavy loss.

This failure is perhaps one of the most serious that has occurred in the fire insurance business in twenty-five years. It seems to be due to incompetency or worse on the part of one or more of the principal officers, supplemented by the ignorance and neglect of the directorate. The report of the Insurance Department examiners reveals a series of irregularities by the former president in December of last year and January and February of this year in a desperate attempt to make a financial statement which on its face would represent the company to be solvent. The bank accounts were juggled in a way to make nothing but paper do duty as cash on deposit.

Here we have another example of the impotency of State supervision of insurance to safeguard the interests of policyholders against injury, and another illustration of the reliance which an insurance company's

patrons must repose in the integrity of those composing the managements of companies. The laws in force are sufficient and efficient if they are obeyed by those conducting the companies, or rigorously enforced by insurance departments. In this, as in many other instances past, State supervision has revealed, not prevented, a failure.

No Compensation Law Yet

Opinions in the State of New York, particularly that portion of it in a representative form concentrated at Albany, continue to multiply over the sort of workmen's compensation measure which should be enacted. In point of population, commerce, industry and finance the first State in the Union, it lags behind the others wofully in this important matter. Much inferior industrially, the adjoining State of New Jersey grappled the problem two years ago and in the judgment of those who should know, solved it creditably; in fact, liability experts freely express the opinion that the workmen's compensation law of that State is the wisest and most practicable thus far enacted by any of the States.

The New York Legislature has been wrestling with three bills more than two months and a fourth—intended as a compromise measure—is now before it. Time passes, the date of adjournment draws near but the workmen's compensation provision does not get forward.

Several weeks ago a committee of the New York Chamber of Commerce reported on the matter briefly discussing the various measures under consideration and rather inclined to the Foley-Walker bill as the most practicable. The organized labor interests of the State are uncompromising in their support of the Murtaugh-Jackson bill and their unwavering attitude is doubtless having its effect on a number of legislators. In a report just made by the executive committee of the New York Board of Trade on the compromise bill to which we alluded above, the opinion is exprest that it is unsound and unsatisfactory, and that its constitutionality is seriously in doubt. So, there you are! The labor interests will consent to nothing but their bill; the employers prefer the Foley-Walker bill; the compromise measure said to contain all the virtues and none of the vices of all the other bills is probably unconstitutional; adjournment approaches and the wheels do not revolve.

We would suggest to all the parties at interest that they read a page or two of the New Jersey book.

Notes

Indiana has enacted a fire marshal law.

In January last the New York Life Insurance Company received 11,000 applications for new insurance.

The Manhattan Life Insurance Company has appointed George Loesch manager of its metropolitan agency. Mr. Loesch is a trained and energetic agency director.

Under protest, the Northwestern Mutual Life Insurance Company has paid into the State Treasury of Wisconsin taxes aggregating $505,643 for the year 1912. This is a heavy tribute to levy on mutual policyholders.

Superintendent Stewart, of the New York Board of Fire Underwriters, finds on investigation that 43 per cent of the fires in garages are due to back fire into carburetor and 33 per cent to use of gasoline for cleaning.

The American Union Fire Insurance Company of Philadelphia, which commenced business in January, 1911, is in financial difficulties and has discontinued the writing of business. Its organizer, James F. Stone, has resigned the presidency and is succeeded by William H. Bilyeu, president of the Philadelphia Knitting Mills.

Fire Marshal John W. Zuber, of Ohio, criticises the prompt adjustment and payment of some losses by fire companies and recommends a more deliberate policy. He states that while Ohio has its share of incendiary losses, they are individual efforts to defraud the insured and not the work of an organized gang of incendiaries.

Edward A. Walton, a prominent fire underwriter during the last quarter of the preceding century, died in New York City on March 13, in his seventy-sixth year. He was for many years president of the old Citizens Insurance Company of New York, and served as president of the National Board of Fire Underwriters and the New York Board of Fire Underwriters. He retired from active business in 1902.

Criticising the impracticability of State insurance, Second Vice-president Baker of the Pacific Mutual Life stated before a meeting of agents in Chicago that there were men present who would write more life insurance in 1913 than the Wisconsin State Fund would write in the next ten years. Reports are to the effect that Wisconsin's venture into the life insurance business is not being patronized by the people of the State.

FINANCE & TRADE

Stock Exchange Incorporation

Governor Sulzer has caused to be withdrawn from the New York Legislature his bill doubling the tax on sales of securities on the Stock Exchange. This bill had been opposed not only by bankers and brokers, but also by business interests generally. A strong and convincing protest was made by the Merchants' Association's special committee, of which Edward D. Page is chairman. The main objections to the proposed legislation were that it would divert financial business from New York to rival cities, greatly decrease the volume of legitimate transactions on the Exchange, cause the establishment of transfer offices elsewhere by large corporations, and exert a depressing influence upon local trade and business of many kinds. A Chamber of Commerce committee regarded the measure as "a serious menace to the commercial and financial supremacy" of the city.

Nine of the Governor's financial bills have been reported favorably in the Assembly. The most important of these is the one requiring the Stock Exchange to become incorporated. It will be remembered that the Pujo Committee at Washington proposed to compel such incorporation by withholding use of the mails and telegraph lines from the Exchange and its members, a device first suggested by Thomas W. Lawson. Incorporation, as required by the Pujo Committee, must be accompanied by many severe statutory restrictions and much official supervision. The bill pending at Albany is based upon a false conception of the nature and functions of the Exchange, which does not buy or sell or borrow. By incorporation it would authorize the Exchange to borrow and lend, sell, transfer, etc., granting powers which the Exchange has never had or sought. We do not think that incorporation is required in the public interest, believing that it would do more harm than good.

An investigation, followed by a memorable report, was made in 1909 by what was known as the Hughes Committee. In that report, which was one of the sanest statements of the kind that has ever been published, questions relating to incorporation were carefully considered. Having said that it had been strongly urged to recommend incorporation, the committee continued:

> Under existing conditions, the Exchange, being a voluntary organization, has almost unlimited power over the conduct of its members, and it can subject them to instant discipline for wrongdoing, which it could not do if it were an incorporated body. We think that such power residing in a properly chosen committee is distinctly advantageous. The submission of such questions to the courts would involve delays and technical obstacles which would impair discipline without securing any greater measure of substantial justice. While the committee is not entirely in accord on this point, no member is yet prepared to advocate the incorporation of the Exchange, and a majority of us advise against it, upon the ground that the advantages to be gained by incorporation may be accomplished by rules of the Exchange and by statutes aimed directly at evils which need correction.

The Exchange was warned, however, that if it should not be active in preventing wrongdoing, the public would insist upon incorporation and official supervision. Five of the committee's reform suggestions, or less than half of those proposed, were adopted by the Exchange. Within the last few weeks it has taken action against certain objectionable practices. More remains to be done, but a strict and severe enforcement of rules long in existence would probably be sufficient. Members are subject, of course, to the laws of the State, and statutes may be enacted "aimed directly," as the Hughes Committee said, "at the evils which need correction." If all that reasonably may be desired can be accomplished by statutes and by the Exchange's rules, incorporation should not be required, and thus the disadvantages which would accompany it should be avoided.

The forcible statement recently submitted to a sub-committee of the House Committee on Banking and Currency by William A. Nash, chairman of the board of the Corn Exchange Bank, has been published in a pamphlet. Much of it relates to Clearing House Associations, and especially to the association in New York, to whose helpful conduct in times of stress Mr. Nash refers. In his opinion, "the use of the existing system of Clearing Houses forms the best basis for the expansion of credit and the supply of currency," and the hoarding of currency in panics would be prevented if the Clearing House loan certificates should be made convertible into currency at 50 per cent of their face value.

The Independent
A Weekly Magazine
Founded in 1848
March 27, 1913
VOLUME 74 NUMBER 3356

President Wilson's Chinese Proclamation

We have never liked the participation of our Government in supporting the six-Power loan to China, and we are glad that President Wilson has declared that the present Administration will have nothing to do with it. We do not doubt that in joining in it the last Administration had only honorable motives, and that they believed they were defending China against their wicked partners; but, as President Wilson so well says, there is danger that our alliance with them may compel us even to join them in enforcing claims that might arise. It is better to join no league of this sort, which will involve our Government in the internal affairs of a strong sister republic. Nor do we believe that the bankers who were to supply the American money are sorry to get out of it. They joined in the scheme at the request of our Government, and with no enthusiasm. They expected little profit, and have their labor for their pains.

To be sure, it is the better part of government to advance the prosperity of the country; and the maintenance of a share in commerce is one element in prosperity. No doubt our government, in its fine work for the open door in China, inaugurated by John Hay, had in mind the preservation of the right of our people to the same privileges of trade in China as other nations should have; and the participation of the United States in the six-Power loan had this same object. It was meant to assure that a fair share of the equipment of the Chinese railroads should be purchased in the United States. That is all right; but why cannot bankers, if they think best, make their own terms without the support of their Government? Just for this reason, that the Government's protection means that the loan is not made at the bankers' risks. If China should fail to meet the obligations assumed, our Government would be pledged to compel it to do so. It would seize the custom houses. The very conditions of the loan provide that certain national taxes, domestic or foreign, should be set apart for the interest. If in any disturbance that income is diverted we should be obligated to put military pressure on China. Now, that we ought not to do. It is better that our financiers should take their own risks and not involve our nation. For this reason we are glad that China has so strenuously rejected the hard terms imposed by the six Powers, and we are glad that by this delay we are out of the business, thanks to President Wilson. We have responsibilities enough of the sort at home with our Monroe Doctrine to warn us against adding others with China.

While we have only approval for the decision made by President Wilson, it is not so easy to approve the way it was announced. No notice of it was given beforehand to the five governments involved with us, nor to the American bankers concerned, nor to the State Department in Washington, in charge of First Assistant Secretary Huntington Wilson, during the absence of Mr. Bryan in the West, and Secretary Wilson has instantly resigned.

During the long negotiations over the loan there has been no occasion for China to feel harshly toward the United States. It is not our Government that has been pressing severe terms. We believe this proclamation of President Wilson, with the recognition of the republic, which is likely soon to follow, will prove to China our good will and make the United States the most kindly regarded of all nations. We have no desire to exploit China for our benefit. We only desire her prosperity and her success as a great Oriental republic.

Santo Domingo and Central America

It is asserted in Washington that the Wilson Government's action with respect to the proposed Chinese loan foreshadows and will be followed by repudiation of what may be called the financial policy of the Roosevelt and Taft Governments in Central America and Santo Domingo. We hope this is not true. The questions relating to China may well stand by themselves. A settlement of them does not necessarily involve similar action concerning what has been undertaken in countries lying between the United States and South America.

The attitude of our Government toward those countries has been helpful and unselfish, if we except the Panama incident, as it was characterized by Mr. Roosevelt. It is true that we have not overlooked an extension of trade and influence, or the prevention of complications which might arise under the Monroe Doctrine, but it is fair to say that the fiscal experiment in Santo Domingo has been mainly altruistic, and that the projected similar experiments in Nicaragua and Honduras were designed to serve the interests of the people of those countries. There has been no thought of gaining political control, of promoting annexation, or of interfering with the independence of the republics.

When the agreement with Santo Domingo was made, that country had for years been subjected to almost continuous revolution. At least one European Power was ready to seize custom houses in the interest of its bondholders. The borrowed money, loaned at usurious rates, had been expended in corruption, extravagance and wars. Our Government procured a reduction of the principal of the debt from nearly $40,000,000 to $17,000,000, and helped the republic to pay it by providing for an honest collection of revenue. In seven years about $20,000,000 has been collected and more than $9,000,000 has been deposited in New York for the foreign creditors. Honest supervision has more than doubled the customs receipts, the sum remaining annually, after setting aside about one-half for the debt, exceeding the entire annual revenue at the time the work was begun. Santo Domingo's tariff has been reduced, there have been public improvements, from Europe there has been no threat of interference, and during nearly all these years the republic has enjoyed peace. Recently there has been some disturbance, but the Government has been upheld.

Nicaragua and Honduras had been racked by revolutions. Honduras had suffered from seven bloody wars in fifteen years. Both had been the prey of corrupt rulers, raised to power by factions that sought control of the custom houses. Both were virtually bankrupt. Honduras had a foreign debt of $124,000,000, four-fifths of which was unpaid interest. After the deposition of Zelaya there was an opportunity for giving aid to both of these republics. Our Government devised a plan, which the foreign bondholders accepted. It involved a loan of $10,000,000 to Honduras and another of $12,000,000 or $15,000,000 to Nicaragua, with a supervision of the collection of revenue by agents whom the loaning bankers should name and whose appointment should be approved by the President of the United States. The greater part of the money was to be used for certain specified purposes; a portion was to be set aside for the foreign debt. Nicaragua's currency was to be reformed. It was in a deplorable condition, owing to the paper issues of Zelaya and others of his kind.

The agreements entered into with these two countries were sent to our Senate, which has refused to ratify them. Hoping that they would be ratified, the bankers have done something in Nicaragua, where the currency system has been greatly improved by American ex-

perts. The new coins for which provision was made were recently shipped from New York. There was to be an American bank in Managua. A charter was obtained, but probably there will be no bank, if the policy of our Government is to be reversed. Some have said that the recent abortive revolution in Nicaragua would not have been started if the loan convention had been approved by our Senate. If there had been no revolt the cost of landing our marines would have been saved. One object of what has been unjustly called "dollar diplomacy," in the countries south of us, has been to save money, for the cost of patrolling coasts, landing marines, etc., to protect Americans and their property, has averaged at least $1,000,000 a year.

The plan proposed for Nicaragua and Honduras, if carried out, would serve our interests as well as the interests of their people. It would promote peace, a development of national resources, and the settlement of just obligations, American claims included. We do not see that the bankers could gain more than a fair interest on their loans, and we understand that they were by no means anxious to lend the money. Probably they do not regard their advances already made in Nicaragua with much satisfaction. The average revolutionist leader in Central America has the custom houses in mind. If these can be placed under the indirect guardianship of the United States, revolutionists will be discouraged and the plain people of the so called republics will be enabled to live comfortably, to improve their opportunities, build up their countries, pay their foreign debts, protect their foreign residents and give a hearty welcome to foreign capital. Very careful and dispassionate examination should precede any abandonment of Mr. Taft's policy by Mr. Wilson.

Peace in Sight

Turkey begged the great Powers of Europe to intervene in her behalf, and the allies consented to hear what they would say. They have now offered their propositions. They are, substantially, that Turkey should lose to the four allied nations the territory they have taken, and should also lose Adrianople, but that Albania, including Scutari, should be reserved for further decision, as also the Ægean Islands, which means that Albania should be a little independent nation, but that Servia should have a seaport. In Europe, Turkey will retain only enough for the protection of Constantinople, holding the Sea of Marmora, with the entrances to it by the Hellespont and the Bosphorus. Turkey will probably lose the islands. The allied Powers will get what they fought for, unless it be that Montenegro, who will gain something, will not gain all she sought. Her King will go home with a breaking heart, because he did not capture Scutari, but Austria has rudely forbidden it.

This action is taken by the great Powers of Europe, and it cannot well be resisted. But what right have they to intermeddle? The right which Turkey and the four nations have given them, and still further, the right implied in the agreement of all the nations at The Hague to use their good offices for peace. To be sure, all this does not give them the right to enforce their will, but it amounts to the same thing. We believe the war is practically ended.

The four allies get no immense indemnity from Turkey, and ought not to. Turkey could never pay it. They have taken from Turkey all her European possessions, and have no more fear of her. Even the islands are lost. Greece has the best of them, Crete, and will probably have others, while the peril of a Turkish frontier is gone forever. All the four are triumphantly happy, but perhaps Greece the happiest of them all.

The United States has no part in this agreement of the Powers. And yet we have no little interest in the Balkan provinces, as we have also in Asiatic Turkey. Why should not we have demanded that our voice should be heard in the settlement? Not because we are not strong enough; not because we have no interest in the matter. It is simply because we have practically agreed to leave Europe to the Europeans, if they will leave America to us. We do not want the Powers of Europe to attempt to control the nations of this continent. Not

that we will attempt to control them. Brazil and Argentina and Chile may go their own way and we will rejoice. They will keep the peace. We had hoped this were true of Mexico, and we are trying to hope so still. To the small and turbulent republics we simply give a note of warning, and we ask them to keep the peace, and they do well to heed what we say. We have no greed, only a desire for their prosperity, and that they do us no harm. Yet we may well remember that we have a real interest in the welfare of Europe also, and Asia and Africa; and when we are asked, as Liberia asked us a year ago, to give help in time of trouble, we must not stand aloof. We have helped Liberia; and for aught we now know, the time may come when we shall be asked to help Turkey or China. The world is smaller than it was, and the oceans that intervene between the continents are narrower than they were, and humanity in the nations is more closely intertwined than in olden times. The old voice, "Come over into Macedonia and help us," may be taken up in various ways, and be heard from various countries, and our country should not be deaf. China now calls, and it may be that when President Wilson asks John R. Mott to be the Minister to Peking he is listening to a Macedonian cry.

King George of Greece

King George of Greece belonged to the most democratic of the ruling families of Europe, and he inherited the sentiments of his Danish father. Perhaps it is easier to be democratic in a small kingdom; and in Greece King George was no stickler for royal dignity, and was much loved by his people. His son inherits his father's political virtue, has succeeded admirably in the present war, and will be a popular king.

But what a hazardous business is that of rulers! They have to go guarded everywhere, not so much against revolutions as against cranks. As an insurance risk theirs is extra-hazardous. Of our last ten elected Presidents three have been killed in office and a fourth wounded since leaving office. During the last forty years the Czar of Russia, the Sultan of Turkey, the Shah of Persia, the Empress of Austria, the King of Servia, the King of Italy, the King of Portugal, and now the President of Mexico, have all been assassinated, while numerous attempts have failed.

The last is the murder of King George of Greece by a weak-minded anarchist of his own nationality. It is a matter for congratulation that if he was to die, it was not by a Turkish hand. That will not be added to the international hatred. We anticipate new prosperity for the Greek nation, if it will only understand that its glory is not to come from war, but from the arts of peace. No other nation has such a history, and may its future be worthy of its past.

Static Architecture

The editorial which inspired Mr. La Farge to his eloquent plea for classical architecture merely ventured to express our disappointment that the design chosen did not show something of that originality, individuality and freedom from traditionalism which was so eminently characteristic of Lincoln himself. Mr. La Farge's reply convinces us that we were altogether wrong in hoping for anything of the kind from American architects of the establisht school.

But it is curious to observe that Mr. La Farge's article is really much less a criticism of our views than it is an attack upon the monument it undertakes to defend. The Bacon design does just what Mr. La Farge says ought not to be done, for it sets before us, in imperishable bronze, the body of Lincoln with all those personal and external characteristics which he finds so disillusionizing. We did not propose to model the building after Lincoln's unique bodily proportions. We did not propose to carve upon its walls his Rabelaisian jokes. But the Bacon memorial is designed to contain a statue of Lincoln which will doubtless bear some resemblance to the man whom it is intended to represent. If so, it will fall under Mr. La Farge's censure, for it will convey to future generations the disenchanting knowledge that Lincoln's face and form deviated in some particulars from the standard which the Periclean artists establisht for all time as the only proper embodiment of gods and heroes.

It may show the wart upon his cheek as well as that divergence from bilateral symmetry about the eyes which Gutzon Borglum finds so full of meaning. The statue will doubtless be clothed, and, if so, it will perpetuate a memory that the world would willingly let die, the fashions of the '60's. Perhaps—tho we hope this crowning horror may be avoided—there will be the stovepipe hat, the most hideous habiliment that human ingenuity has ever devised. How, then, can the devotee who makes a pilgrimage to this shrine pay due reverence to the pure and eternal spirit of Lincoln when these earthly and temporal accidents are obtruded upon his attention?

Now this anachronism, this incongruity between the Greek temple and modern effigy inside of it, would be no less distressing to us than to the classical taste of Mr. La Farge. It is, however, inevitable, because portrait sculpture is in America a growing art, while monumental architecture is a stagnant one. A hundred years ago there would have been no such incongruity between the statue and the shrine, because then sculpture was under the dominance of the classical tradition, as architecture is still. In those days the artists, reasoning quite logically from the same premises as Mr. La Farge, portrayed our statesmen and generals in the costume of classical antiquity. It is to this period and to these ideals that we owe Greenough's colossal statue of George Washington which stands in front of the Capitol, his expressive gestures seeming forever to say, "Here is my sword. My clothes are in the National Museum over yonder."

All the other fine arts—sculpture, painting, music, drama, literature—have broken away from the rules and limitations which the Greek theorists laid down as eternally right. But the architect, he stands pat. Yet even he has been driven to his last ditch. He is forced to confine his imitative genius chiefly to the construction of mausoleums. Live people will no longer live in what he builds.

But we are reminded that there is still another department of modern civilization where the classical tradition is still strong, that is, education. We admire the Greeks for many things, especially for their courage and initiative in freeing themselves from their traditions and environment and originating new movements in almost all forms of human activity. We could speak as enthusiastically, tho not so eloquently, as Mr. La Farge of Greek achievements in sculpture, architecture, literature, politics, philosophy and ethics. But we must say that the disposition shown in some quarters to uphold Greek ideals as perpetual and unsurpassable, and Greek civilization as worthy of indiscriminate imitation, seems to us false to history and inimical to progress. We prefer to maintain those virtues and ideals which have been developed by more than twenty "centuries of man's slow growth, his struggle upward toward perfection," which now form the foundation of our modern civilization.

Boutet de Monvel

How many children and how many that are children no longer have delighted in the work of Louis Maurice Boutet de Monvel, the French painter of children, whose death was reported last week from Paris! De Monvel was best known to the world as an illustrator—illustrator, above all, of two volumes of French songs. To many of us the lines of such old favorites as "Malbrouck s'en va-t-en guerre" (that every one remembers as occurring in *Henry Esmond*), or "Au clair de la lune" (that Trilby sang till tears filled all eyes), or

Sur le pont d'Avignon,
L'on y danse, l'on y danse,

suggest nothing more immediate than the simple and beautiful pictures of a home-loving, child-loving artist, great enough to please children and fellow artists alike with his simple, pure and flat toned drawings in color.

Boutet de Monvel was a veteran of the Franco-Prussian war; he bore the same name as a famous actor of the Comédie Française; he came to America some fifteen years ago and made some paintings here; but most of us will remember him ever not for any of these reasons, but because of our associating him with lessons in *La Civilité*, with his *Jeanne d'Arc*, and with his delightful variations on children's roundels, like *Savez-vous planter les Choux*. Many a

painter of battle scenes and cubic brainstorms will be forgotten—but Boutet's memory is secure. He understood and loved children.

Marriage Looking Up

Marriage is coming into favor again. This is perhaps the most interesting discovery made by the Census of 1910. The announcement is a bit of a shock to economists who had made up their minds that the rising cost of living had made an end for good and all of the nice old custom of early mating. It puts out of business, too, those social moralists who specialized on the perversity of our modern young people. We shall have to get on without the sermons and the editorials on the folly of young women whose appetite for candy, flowers, theaters and late suppers has frightened away our aspiring clerks and bank tellers in the twelve hundred dollar salary class, and on the lamentable depravity of young gentlemen of means that care more for clubs, motor cars and bachelor functions than for cosy little homes in flats.

It seems that since 1890 the proportion of the married, widowed and divorced in the American population has been increasing. Twenty years ago the males who then were married or had been married were 58.1 per cent of the population. In 1900 they were 59.4 per cent, and in 1910 they were 60.8 per cent. The females that were married, or had been married, were, in 1890, 68.1 per cent of the population; in 1900, 68.6 per cent, and in 1910, 70 per cent.

The explanation of this change in our domestic habits is not entirely obvious. It is not accounted for by the composition of the population. Native and foreign born both are displaying a new appreciation of the connubial relation. Each principal race, nativity and parentage group shows increasing matrimonial proclivities. Among white foreign born males the married, or had been, were proportionately fewer in 1910 than in 1900. This last item means, however, only that immigration in the last decade brought us a larger proportion of single men and a smaller proportion of families than in former years. The married, or had been, were 70.3 per cent of total foreign born white males in 1900, and 67.8 per cent in 1910.

If the statistics are examined by age groupings, they are even more significant. In 1890, one-half of 1 per cent of our male youngsters between fifteen and nineteen years of age were married. In 1910, 1.2 per cent of this class had entered into the matrimonial experiment. In the age-group from twenty to twenty-four years, 19.2 per cent were married in 1890, 22.1 per cent in 1900, and 24.6 per cent were married in 1910. In all the age classes up to thirty-five, the increasing proportion of the married is found, but in the age classes above thirty-five there is a decrease. The married, widowed or divorced males in the age class thirty-five to forty-four were 84.5 per cent in 1890, and 83.1 per cent in 1910.

A study of the vital statistics of foreign countries discovers the significant fact that this phenomenon of a rising marriage rate, manifested chiefly in marriage at earlier ages, is not restricted to the United States. Even in France the new tendency is marked. Plainly, therefore, the cause is general, and it is not to be found in the migratory shiftings of population. It began before the rise of prices had greatly affected the economic situation, and it continues in disregard of the average price of rent, clothing, food and fuel.

It would be pleasant to believe that the change has been brought about in part by a general response to sound teaching; that it is, indeed, indicative of moral progress and good sense. It is possible that the world-wide crusade against habits of sexual irregularity have had some effect. Beyond any doubt the number of young persons wholly ignorant of the devastation wrought by the diseases that penalize such habits is vastly smaller than it was a generation ago. In view, however, of the present magnitude of the so-called white slave traffic, it would be rash to assume that this consideration has greatly affected the marriage rate.

We fear that a far more important factor is indicated by another statistical fact. The marriage rate is rising thruout Europe and America, but everywhere the birth rate continues to fall.

In Paris it is now very near the death rate. In the German cities of Hamburg and Berlin, which until recently were still in the high birth rate column, the rates are now rapidly falling toward the French level. America is a close second to France in this tendency. It looks very much, therefore, as if there were no escape from the conclusion that the marriage rate, which for a long time fell as steadily as the birth rate did, is now again rising while the birth rate continues to fall, because the population in all countries, and to a great extent within all economic classes, has learned that children are not inevitable consequences of the marriage relation.

The Week

At the beginning of the year we enlarged the scope of our "Survey of the World" to include news of what is being done in the fields of science, invention, engineering, art, drama, religious and philanthropic activity, business, agriculture, household affairs, etc. This department in its new form has proved its value and will be retained, for it provides information of important movements not adequately covered by the daily press. But many of our readers missed the concise and impartial summary of current events which had for so long been the leading feature of THE INDEPENDENT. It was used in private and public schools as a manual of contemporary history, and even subscribers who read several newspapers a day found it valuable as a sort of review to correlate and fix in their minds the chief events of the preceding week. In response, therefore, to a very general demand of our readers, we have restored this department under the title of "The Week."

The Korean Conspiracy Case

The trial on appeal of a hundred Koreans who had been condemned in the court of first instance to terms of imprisonment, on the charge of conspiracy to murder Governor-General Terauchi, has ended with the acquittal of all but six men. The case attracted very great interest, from the fact that most of them were Christians, and were convicted on their confessions, forced from them, they said, by torture. While the final details are not yet available, we may safely assume that the charges of torture were proved, and no other evidence against these men, who included not a few teachers and preachers, was presented, except that they may, some of them, have belonged to purely benevolent societies. The acquittal shows, as we have all along believed, that the Japanese Government has no prejudice against Christianity in Korea.

Six men are convicted, one, Baron Yun Chi-ho, a Christian and a graduate of Vanderbilt University, formerly Minister of Education in Korea; and another was editor of a Korean journal suppressed five years ago for reprinting an article approving the assassination in San Francisco by Koreans of D. W. Stevens, the American adviser of the Japanese in Korea. It is not incredible that there was a conspiracy, for the feeling against Japan rose high among many Koreans, and Prince Ito, the first Governor-General, and the most honored, and deservedly so, of all the Japanese, was assassinated by a Korean. But it is simply incredible that there should have been, as claimed, a thousand men engaged in a conspiracy to murder one man. It is not done in that way anywhere. It is not easy to believe that so worthy a man as Baron Yun Chi-ho would have been guilty of such a crime; but that he was a foe to Japanese rule, and even a member of a society for its overthrow, is not incredible. In the case of the six there may be a yet further appeal.

The trial appears to have been carried on with great fairness and patience, and has lasted quite two months. As we have read the reports we have observed that the counsel for defense have not been inclined to deny that a conspiracy existed, but argued that their clients could not have been in it. Only praise is due for the judge, who has allowed the men accused to make long and rambling speeches in their own defense, and has called the witnesses they asked for. The trial has been a great contrast to the first trial, in which witnesses were refused and the prejudice of the court was clear. The accused have suffered for a year imprisonment and torture, but

the acquittal of a hundred of them is a source of much gratification to the missionaries, who have never believed them guilty; and it is a credit to the Japanese judiciary, which had suffered a stain by the subservience of the inferior court to the local military regime.

Unicameral Government

England had originally but one House of Parliament, the Lords. It did not occur to anybody that any one else could be fit to rule. The lords owned the land; the rest were serfs. By and by those not lords began to get intelligence and wealth and to demand their rights. Then was created a feeble House of Commons, giving to England a bicameral form of government. By degrees the Commons grew stronger and stronger, until the Lords fell to be the Second House, and now it has no power to prevent any legislation that the Commons shall insist on. Even the reformed House of Lords will not have the right of veto. The system approaches the unicameral.

Because Great Britain was thus governed, the United States put the bicameral system into its government, a Senate and a House of Representatives, the Senate representing States instead of a landed nobility. Our States and cities followed the same bicameral plan and it became universal, except as smaller units had direct government by town meetings, with a single board of selectmen.

But it appears that in our cities the bicameral system is breaking down, and the experiment is being tried of a unicameral, commission system, less cumbrous, less open to corruption, with more responsibility. So far it seems to work well, and is likely to extend.

Now the question arises, Can the unicameral system be applied wisely to an entire State? Not yet is the question raised as to the nation, as in a measure in Great Britain. In the coming constitutional convention in Kansas this is likely to be the fundamental question. But which shall be kept, the Senate or the House? Is it proposed to keep neither, but to create a new sort of legislative body, the members of which shall not represent special localities, as at present, whether districts or counties, but be elected on a general State ticket, just as is the Governor.

An even more radical plan has been recommended by the Governor of Kansas, and will be described next week in an article by Mr. Harger. It would put the whole State under a commission of no more men than there are Congressmen. That is not quite a joke, but is not likely to find favor this decade.

Either is a radical change, indeed, but not for that reason unwise or impracticable. It is in the line of the better fixing of responsibility. Whether it will work well depends on the character of the people, for any system will work well with a safe and sane people. The advantage of the plan as proposed in Kansas and Colorado is that it abolishes the conflict in the legislature of local demands or jealousies, and will direct the attention of such a new legislature to the interests of the State as a whole. Our people everywhere, who are carefully watching the commission system of city government, will be glad to see the experiment of a single legislative chamber tried—in some other State than their own. Let Kansas try it. She has played with more devices, good and bad, and has more political philosophers to the thousand, than any other State in the Union. And Kansas has courage.

Maple Sugar

Wherever maple sugar can be made, it is a moral duty to make it; not merely to add to the wealth of the community, but to the welfare. Boys brought up in the country should know as much as possible of the sweet side of country life, and we do not remember, dating from the writer's boyhood, anything else quite as full of fun, yes, and lasting joy, as that which was obtained from a sugar bush in spring.

We go back to the tapping days with delight. We can, in memory, taste the sap as it first worked its way out from the bored trees, thru the old-fashioned elder spiles, and dropped reluctantly into pail or pan. Then came the "boiling down"; and the syrup that grew sticky; and then the cleansing process, which summoned the feminine

art of the household to displace the masculine. This cleansing was done with milk and eggs, and there must not be any carelessness just at this point or the sugar would be second grade. From the syrup, the next stage was what was called "the waxing," and at this point the hot stuff was dropped in spoonfuls on cakes of ice or pans of snow. Finally came the granulating stage, and then the young people of the house must stir the kettle for half an hour, to secure whiteness of the sugar. It was a simple household art, and altogether as charming as it was effective.

The little cakes, which were the final result, were just big enough, each one, to lie quietly in a boy's pocket; yes, two or even three might find room in a schoolboy's capacious pocket—after removing the marbles. It did not make any difference whether the little mother had placed these cakes legitimately where they were found, or whether they had found each other out thru illegitimate wisdom. Any spirited schoolboy would refuse to eat a cake of maple sugar, at recess, if he had not one over for Susan.

Tapping the trees broke in on winter's dulness, and shortened the dreary days close on to one-fourth. It came with a clear, sunny March morning, frosty and sharp, but with a bit of leaking along the edges of the roofs and the tips of the icicles. Somehow everything else came with it. The first bluebird cleaved the air that morning with that clear, faraway song, as high up as one might be seen or heard. What a tremble of song it was, rippling as it had all the way from Florida to New York. But as the sap began to fill the pans, the first robin also would look down upon us and chirp his greeting. Then every hand clapped, and all the northern world was glad, for everywhere the robin was the signal of spring, and the pledge of flowers and fruit.

And the woodpeckers pecked, and the squirrels stuck their heads out of their winter holes with a rustle of inquiry and a shoo-fly for intruders. Toward noon the sun rays had felt their way into the middle of the hives, and the bees, warmed to life, ventured out for a flight of inquiry. Very few of them, alas! ever got back again. A few tasted the sap in the pans and were drowned, but others with stiffened wings lay down on the snow, nor could any sun ray ever again wake them to joy. Hens cackled and roosters shouted that the days had returned when superfluous corn grains should be turned over into eggs. What fun it was to hunt those eggs in the haymow and in the old cutter and corners.

Not one of us but expected forever to make maple sugar every spring, and for that matter to carry some of it in our pockets for school lunch. Editorial offices were unthought, and big cities—well, we had not even seen a small one. Those were the days of quiet and comfort; of small things that filled up big hearts. We were all happy, moderately pious, and joyfully industrious. We had not yet got into the age when nobody could be happy or contented who was less than a millionaire, and he least of all.

Maple sugar is a Yankee affair, and all other sugar is mercantile, without romance. The last thing to please a boy is a beet garden, where weeding is carried on, or a cane field where still there are weeds to pull, and where the mules must be driven in the cheapest sort of unromantic harnesses. Every Yankee, therefore, ought to make sugar, if he owns five acres of New England soil. For that matter he can make it all the way thru New York and far up into the Northwest. It is not quite easy to discover why these inseparable products have become so widely separated, the Yankee and the sugar. We believe it would be economically advantageous if the crop could be a good deal more than quadrupled every season. The market is always good, and the amount of real sugar that is for sale is insignificant. Most maple sugar is made in bakeries, or otherwise has never seen a maple tree.

The chief trouble has been that you cannot grow a maple grove in a year, nor even in ten years. The sugar maple tree is a deliberate grower, and does not come to profit before it is twenty-five years old; but after that a tree rightly tapped should be in good service for two hundred years. It is a grand property to hold, quite as good as a Southern pecan grove, or an orchard of butternuts and

English walnuts. The difficulty has been increased by planting the trees in the streets for shade, and then giving them over to professional trimmers, who have invariably spoiled them for "spiling." Today not one maple tree in twenty, thruout the country, is fit for even shade. Bad trimming has let the sun strike the bark and split it; then have come in the insects; and the people are now afraid to plant maples either in the streets or in the orchards, for fear of blight.

However, there really is not a hardier or healthier tree in the American sylva. All you want to know is how to treat it. The sugar maple asks mainly to be let alone. Set a "tree surgeon" at a grove or a row and give him a saw, and you may set it down as a certainty that he will start them on the road of a short life. The maple likes to have its limbs come down toward the ground, and what a tree likes you have got to consider. Those people who go around with ideals in their heads must be looked out for. They want all trees to grow alike; well, Nature does not. If you try to compel it by knife and saw you will have nothing but mutilated foliage and growth.

So from either standpoint, that of pleasure or profit, or both, maple sugar appeals to us strongly. It is a native industry; it is full of fun for young and old. There is plenty of room for maple groves, and there is no sort of reason for supposing the maple tree to have played out. We wish that every one of our readers could have a taste of genuine maple sugar, and we imagine that most of them would immediately resolve to plant a grove.

In Brief

The most disturbing factor in the Balkan situation is the apparent determination of Austria to forbid the capture of Scutari by the Montenegrins and Servians, and the insistence that Albania shall be a separate principality under her protection. With the disapproval of Europe, Austria seized, in violation of treaties, Bosnia and Herzegovina during the Turco-Italian War, and now she would make Albania her *appanage*. Austria is playing with fire. She has sent a squadron to make a demonstration against Servia, and active measures might involve Europe in war.

'Twas on Saint Patrick's day,
  Says Wilson: "Brother Bryan,
Be careful what you say;
  You've stept on the British lion.

"The Secretary of State
  Must keep his tongue in tether.
When you the Lords berate
  Look out for squally weather."

But an expansive grin
  Spread over Bryan's face.
"If mine is such a sin,
  Are you in better case?

" 'Tis Redmond's sprig of green
  You wear on Patrick's Day,
To insult the King and Queen;
  And what will England say?"

The difficulty that President Wilson has in finding any but millionaires to fill the higher diplomatic posts, emphasizes the importance of the possession by our Government of residences for ambassadors in the European and other capitals. It is not decent for a man to pay half his salary for rent. An ambassador must have a place worthy of his country at which he can officially entertain guests. This is not a matter of Jeffersonian democracy, but of good service and official propriety.

We take this from the *Western Watchman:*

> We do not see the use of spending millions of the people's hard-earned money to keep up the seventh and eighth grades in our public schools, seeing that so few enter them. The most that a boy or girl learns in a public school after the age of ten is bad habits. The three R's could be better taught in half the time that is now given to schooling and at one-tenth of the cost.

Is not this utterance quite exceptional? Would any other Catholic journal say as much?

THE INDEPENDENT refused to give credence to the story of the discovery by Professor Reisner of a cavity and temple inside the Sphinx, and last week positively denied the story as a reporter's invention. Since then we have seen cablegrams from Europe doubting or denying. It is all a fake.

President Wilson and family occupy the same pew in the same old New York Avenue Presbyterian Church in Washington that was occupied by Abraham Lincoln, and which gives occasion to the lines by Dr. Lyman Whitney Allen in our issue of this week.

The punishment which Coatesville, Pa., receives for its horrible lynching of a negro does not quite fit the crime, but it has its fitness. The County Court has refused to renew its liquor licenses.

The Duty of the Democrats

A Practical Proposal for a Moderate Reform of Tariff Schedules

By H. R. Mussey

[The most important political issue before the American people at the present time is the revision of the tariff which the new Congress will consider at the special session. In this article Dr. H. R. Mussey, associate professor of economics in Columbia University and secretary of the Academy of Political Science, explains clearly what changes we may reasonably anticipate and what effect they will have on the cost of living.—EDITOR.]

The Democrats may fairly maintain that they have been given a mandate for tariff reduction. During the campaign the President-elect steadily pushed this issue forward, and tariff revision is a logical first step in his program of "industrial liberty." The public expects revision, and the business community is prepared for it, being too busy and prosperous to anticipate death and destruction from a lowering of the rates. With an overwhelming majority in the House and with a reasonable probability of support from progressive Republicans in the Senate for a moderate tariff program, the Democratic leaders have the best opportunity in a generation to make a start toward a rational adjustment of rates. They ought to go at the task soberly and unflinchingly, appreciating the importance of the public and private interests involved, but realizing the exaggerated importance attached to our tariff by its friends and its foes alike.

They are confronted by a demand that they redeem, if they can, their promises to do two things almost hopelessly irreconcilable—to reduce the cost of living and to injure no honest business (which term it is assumed does not include monopolies). If tariff revision is to reduce the cost of living, it must reduce prices. If prices are reduced, weak and inefficient producers, who at any long-maintained price level do little more than cover expenses, will be seriously embarrassed if not driven to the wall. We have built up, for example, a three-hundred-million-dollar woolen and worsted industry on the basis of prices determined behind a 100 per cent tariff barrier. In this special case, the removal of duties would unquestionably lower prices, with serious consequences to some manufacturers. The same thing is true in the making of tin plate, some sorts of fine cottons, silks, and in general, goods which are produced under competition and the price of which is actually kept up by the tariff. Here lower prices are to be had only at the cost of some manufacturers.

On the other hand, where our prices are already below the point that makes import possible, the removal of a duty in any really competitive industry will leave things just as they are now and prices will be unaffected. Duty or no duty, there are no imports in such an industry. Thus the duties on many iron and steel manufactures are purely nominal, and might be entirely taken off without materially affecting either price or production. In such a case tariff reduction does the producer no harm and the consumer, directly, no good.

There is a general belief, however, that our tariff is utilized by monopolies to maintain high prices, and the common custom of making lower prices for export than for domestic trade lends color to the idea. In such cases it is expected that duties will be mercilessly slashed, with great gain to buyers and with no loss to manufacturers save a loss of ill-gotten monopoly gains. It must not be forgotten, however, that almost every so-called monopoly is annoyed by a group of small competitors trying to make head against it. Price reduction is likely to hurt them quite as much as the wicked monopoly. Of course there are some cases in which a number of strong concerns have combined to fix prices, but they are so few that any hope of large gains to the public thru cutting into the profits of such pools is likely to prove illusory.

In other words, the process of lowering prices thru tariff reduction without injuring honest business is not so simple as it looks in a stump speech. In many cases duties can be abolished without hurting any producers, but then prices

will not be reduced; in other cases prices can be reduced, but then some producers will usually be hurt.

The necessity for getting revenue imposes another limitation. We collect $300,000,000 a year, half the ordinary income of the Federal Government, from import taxes. These customs, in a system such as ours, are objectionable as a main source of revenue because receipts are not easily adjusted to varying needs; they are objectionable as taxes because they bear heaviest proportionately on the poor. Nevertheless, the Democrats stand committed, by tradition and platform alike, to a revenue tariff. It is to be hoped that the income-tax amendment will be promptly ratified and an income tax imposed.

Even if this should be done, however, the Democratic leaders will still be confronted by the task of raising immediately between two and three hundred millions from tariff duties. Now customs receipts are the product of rates multiplied by dutiable imports. If receipts are to be kept up when rates go down, dutiable imports must be increased. This will increase the competition of the domestic manufacturers of such goods and in so far make their situation less easy. This is an unpleasant fact for those who would revise rates downward comfortably, but in no other way can the required revenue be realized from imports, unless we impose duties on goods not produced here, like tea and coffee, which we show little inclination to do. Whether tariff revision is undertaken one schedule at a time or by the old log-rolling method of a general overhauling, the leaders must deal with the revenue problem as a whole; they must keep steadily in view the three hundred millions of government receipts that have got to come from somewhere.

Between the devil of high prices and the deep sea of embarrassed producers, the tariff reformer will be sorely puzzled which way to turn. His high hopes of reducing the cost of living without disturbing honest business, of drawing the teeth of monopoly without breaking the back of small-scale competition, of wiping out "special privilege" without annihilating struggling enterprise, of "freeing industry from its shackles" without killing some of its children in so doing, and thru it all, of securing an abundant and certain revenue—these hopes are not easy to realize.

Have not the Democrats indeed undertaken a hopeless task in trying to make such a downward revision as they have promised? It is safe to say that the general anticipation of great direct gains thru lower prices will be largely disappointed. In tariff making, spectacular gains of that sort can usually be made only at cost of spectacular losses to special producers, and such losses no political party finds it in its heart to occasion. None the less, certain things can be done to the considerable ultimate advantage of all the people as consumers and to the relatively small disadvantage of special groups and concerns that now directly and indirectly depend on the duties.

What then may we reasonably expect? We may hope for an honest measure of downward revision in the interests of consumers, so far as those interests are substantially identical with those of strong groups of producers. Ever since the machine and modern science freed the Western world from fear of famine, commercial legislation has represented primarily the interests of producing groups, checked by the interests of other similar groups and playing within limits set by considerations of general welfare. Such making of laws seems inevitable; for men's interests as producers are so large and direct that they can afford to spend time and money to secure favorable legislation, while their interests as consumers are relatively so small that they cannot afford to take corresponding measures. In our present situation, then, those who expect to see a radical cut in rates simply to lower prices will doubtless be mistaken. What else does the promise not to harm business mean? We should expect, and broadly speaking we should get, revision only where the interests of strong producing groups coincide with those of the consumer or the general public.

Where is such coincidence to be found? First, in securing free food and raw materials for manufactures. Already we have seen the disappearance of free land in the United States, with the beginning of soil exhaustion and of a change from the old extensive land-skinning agricul-

ture. Already we realize that we face definite tho not determinate limits in our supply of timber, coal, iron, copper, oil and gas, to mention only a few of our most important resources. With this realization comes a steadily increasing pressure from manufacturers to get the right to secure wherever they can the food, coal, hides, lumber, pulp wood and other materials that they want. Hence the increasingly successful attempt to free these materials from duty.

This is the meaning of the Canadian reciprocity agreement. driven thru Congress after a long fight, but rejected by Canada. The Middle Western insurgent Republicans charged truly enough that it was a manufacturers' measure, but they played the part of children in statesmanship in opposing it on that account. Let our duties on wheat and meat products become actually effective, as they may do before long, and they will inevitably be swept away; there will be a coincidence of interests between manufacturers and the consuming public before which the resistance of the farmers will crumble. The simple truth is that the greater profits of a varied agriculture have made it relatively unprofitable for us to supply our entire demand for wheat and beef by the old-fashioned cheap methods of extensive farming and ranching.

A first step in a statesmanlike program of tariff reform, then, would be the sweeping away of pretty much the whole of Schedule G (agricultural products and provisions) and the abolition of all duties on lumber and timber, coal and coke, iron, lead and zinc ores, flax, hemp, hides and skins of every kind. Schedule G has been simply a sham from the beginning, designed to make the farmer think that he was getting his share of the tariff plunder. Looking at the matter from a purely selfish point of view, his representatives should realize that that schedule can never be anything but a sham; if ever it became effective, it would quickly be swept away. How much better to be rid of it at once, in order to help the farmer to see where his real interest lies. The duties of these foodstuffs and materials could be removed without serious injury to any strong interest, and with increasing advantage to important industries that increasingly desire to go abroad for their supplies.

In passing, it may be noted that such remission of duties would benefit consumers only indirectly and would do little to bring in the millennium of low prices. Further, it would mean little in removing "special privilege." It might reduce the stumpage value of some timber land a little and cut down the royalties on certain mines; but it would have no effect on a concern like the Steel Corporation, for example, nor would it deal a body blow to the "beef trust," which as a seller of beef and hides is supposed to profit from the duties. Raw hides are free already. The removal of these duties, moreover, would be of small importance to the revenue; for all the materials mentioned above yielded last year less than five million dollars, while all breadstuffs (mostly macaroni and rice), meat and dairy products (mostly cheese) together contributed less than seven millions.

This change, then, would be useful more largely for the future than for the immediate present. It would enable us to get, as we have need of them, the iron of Cuba, the coal of Nova Scotia, the timber of Quebec, the wheat of Saskatchewan, the beef and hides of Argentina. It would help us in the inevitable industrial transformation that is occurring with our growth in population. Agriculture and other extractive industry need no handicap in a country such as ours, and it will facilitate the prompt adjustment of industry to our changing economic and social needs if we get rid, now while we easily can, of these illogical and deceitful taxes. Such action, moreover, will make somewhat easier the more difficult tasks of the tariff reformer.

A second step in a rational program is the removal of duties on all goods that we export largely. Notwithstanding all the ingenious arguments put forward to show that a concern can afford to sell cheaper abroad than at home, unaided commonsense, to say nothing of economic analysis, teaches clearly that a company producing cheaply enough to sell in competition with the foreigner in neutral markets needs no help to hold its own market. The exporter may possibly be more efficient than his non-exporting competitors—but even so, are we to cod-

dle weakness and inefficiency forever? Making all necessary deductions, extensive exports are sufficient proof of the ability of producers to stand on their own feet.

The removal of a duty in an exporting industry will not lower price, unless the business be monopolistic. Under unlimited competition, exports will not occur till domestic price has fallen below foreign, in which case the foreigner cannot send in his goods even if there be no duty. The removal of the duty then serves simply to steady price by broadening the basis of supply at times of extraordinary demand—a not inconsiderable service. Where a monopoly is exporting part of its product for the express purpose of keeping up domestic prices behind a tariff wall, few persons could be found to oppose knocking down the wall. The courageous application of this export principle, if so it may be called, would mean a considerable elimination of duties on the statute book, with consequent simplification and improvement of our tariff system and with but slight lessening of actual receipts.

With iron and steel exports mounting in 1911 to $230,000,000 and running thru almost the whole range of such manufactures, we maintain duties of from 15 to 60 per cent and more on these products. The Steel Corporation sends 10 per cent of its rolled and finished products abroad. Our machinery makers yearly dispose of $100,000,000 worth of their machines in foreign countries. For these goods Canada is our best customer—Canada, in whose market the dreaded British competitor actually enjoys a preference over our makers equal to one-third of the Canadian duties of 10 to 35 per cent. Further, out of $9,600,000 worth of metal-working machinery exported, more than a quarter went to Germany, and almost as much to Great Britain, so that a half our exports actually went into the shops of our two chief competitors. Again, among the foreign buyers of almost $10,000,000 worth of our typewriters, England was our best customer and Germany came next. Against our hundred millions of exported machinery last year stood but nine millions of imports, the dutiable part of which paid above 40 per cent. In the face of facts such as these, who will have the effrontery to say that our machinery makers need duties of 30 and 45 per cent? Our wire mills in 1911 sent $10,000,000 worth of wire to almost every country under the sun; yet our small wire imports paid 37 per cent duty. A half hour's examination of import and export figures is enough to convince any unprejudiced person that a large part of our iron and steel duties could be wiped out of existence without serious injury to anyone.

Our exports of agricultural implements rose from a value of $21,000,000 in 1905 to $36,000,000 in 1911, but we maintain a 15 per cent duty on such goods coming from a country that taxes our product. Our imports of cement last year were but one-seventh of their amount ten years earlier; meanwhile our industry expanded enormously and exports rose five-fold, or including cement sent to Panama, twenty-fold. Last year 3,000,000 barrels of cement were shipped from the United States, yet we taxed imports about 20 per cent. With exports of automobiles trebling within five years and amounting to almost $13,000,000 in 1911, with imports falling by a half during that same period and totaling last year less than $2,000,000, with an output of pleasure cars for 1912 estimated by the best authorities at not less than 250,000 and for 1913 at twice that number (a greater expected increase in one year than has been made in ten years), it requires a credulous man to believe that a 45 per cent duty is necessary to keep our automobile factories in operation. Thirty-seven million dollars' worth of leather and $14,000,000 worth of boots and shoes left our ports in 1911; yet the tearful pleadings of our manufacturers were enough to keep duties of 5 to 20 per cent on leather and of 10 and 15 per cent on boots and shoes. Weak as we are, relatively speaking, in textiles, our manufacturers managed to sell last year of certain cotton cloths above $24,000,000 worth in Canada and Central America, in the West Indies and South America, in China, Arabia, British East Africa and Australia. Do manufacturers who can do this need a complex and tricky schedule of duties running from 25 to 60 per cent on goods actually imported and averaging 43 per cent? Eleven million dollars' worth of rubber exports last year represented 100 per cent growth from 1905;

some of the duties were raised in 1909. Exports of photograhic goods rose almost fifty-fold from 1905 to 1911, when they exceeded $7,000,000, while our duties stood at 20 and 25 per cent and one great concern fixed prices in our market.

It is needless to multiply examples; the lesson is clear enough. Whether such goods are produced by monopolies and trusts or by many separate concerns, the very existence of an extensive export trade constitutes all the evidence needed that no duty is required, even from a protectionist point of view. To the reasonable tariff reformer it indicates a point at which a duty may be lowered to any extent desired without creating serious industrial disturbance and without reducing revenue largely. If the Democrats really wish to lower duties as much as they can, they will select these points for attack, and the more thoroly they do their work here, the better.

Their real trouble will come in dealing with those duties that do really raise prices here by compelling us to depend largely if not wholly on the domestic supply of goods for whose production we have relatively poor advantages as compared with our facilities for producing other things—sugar, for example, woolen goods, fine cottons, linen, silks, china and porcelain, tin plate and finely finished goods of most sorts. In general they are wares in whose making we have no advantage because of cheap raw material or the possibility of wholesale production.

Many of these articles are large revenue producers because we tax both raw material and finished product, like raw and refined sugar or wool and woolens, or because even our high duties do not offset the superior facilities of foreign producers, as in fine cottons, linen and silks. Of $310,000,000 duties collected in 1911, $53,000,000 came from sugar, $36,000,000 from cotton manufactures, $29,000,000 from wool and its manufactures, and $21,000,000 from flax, hemp and jute and their manufactures. In many cases the duties are prohibitive and a lowering of rates would enlarge imports and increase revenue.

The real problem in all these industries is to safeguard the interests of producers. If prices are to be cut by lowering duties, imports will increase and competition will be intensified; unless producers can in some way be compensated, many of them are likely to suffer severely.

As regards Schedule K, the storm center of discussion, a large degree of improvement can probably be effected with rather less difficulty than in many other schedules. It may be doubted whether even free wool would ultimately be a serious matter for many sheep growers outside the Ohio flock owners who stubbornly persist in growing merinos. Free wool was vindicated even during the short life of the Wilson bill, sturdily tho the fact is denied. Give our manufacturers free wool, and there could be severe cuts in the duties on cloths and other finished goods without causing more than temporary difficulty for well equipped and skilfully managed mills. Such cuts would mean a great increase of imports, and we should not blink the fact that there would be a troublesome period of readjustment for manufacturers as well as for some sheep growers; but the gain would be well worth the cost.

The situation in sugar is somewhat different. To take the duty off both raw and refined sugar, as has been proposed, would cut our national sugar bill by something like a hundred million dollars; but it would make a big hole in the revenue; it would be a severe blow to Louisiana cane and Western beet growers alike, and it is hard to see how they could be compensated. Under the existing arrangement the refiners gain simply by the differential between the price of raw and of refined sugar. There is no reason for maintaining this differential and it ought to be abolished no matter what is done with the duty on raw sugar. If we think it worth while to continue the encouragement of beet growing for the sake of its supposed benefits to agriculture, we may conceivably maintain the rates at or near the present level. If on the other hand it is desired chiefly to reduce the price of a commodity universally used, here is an opportunity. It must be remembered, however, that that result will be accomplished, not chiefly at the expense of the well hated sugar trust, but at that of sugar growers and the owners of sugar land.

As for the producers of most of the other goods in the group above referred to, no great compensation to them in the

shape of markedly lower prices for materials or in similar advantages seems probable. If the prices of their goods are lowered as a result of lower duties, they will be injured unless they can shift to other lines of manufacturing, and some of them will perhaps fail. But their protests are not to be taken too seriously; the party in power ought to make courageous reductions in rates, somewhat disregardful of the cowardly dependence that American business men have come to feel on the tariff. Such reductions, however, ought to be carefully planned with reference to the conditions of industry. At the same time they ought definitely to provide for the increase of imports, so as to compensate the revenue for the lowering of rates.

It is probably too much to hope for the consistent carrying out of this part of the program, for there appears to be no sufficiently strong group of producers backing it to insure its success, but along some such lines relief from our present ridiculous tariff situation must be sought. The party that can make even a beginning in attacking these peculiarly stupid and injurious duties will deserve the gratitude of the country, tho it is little likely to get it. It is only by some such painful cutting of rates that much lowering of prices can be directly accomplished.

As regards the tariff, then, the duty of the Democrats may be summarized thus: (1) The enactment of an income tax at the earliest possible date, so as to release the Federal Government from its exclusive dependence on indirect taxes. (2) The freeing of food and raw materials from duty. (3) The putting on the free list of all articles that we export in large amount. (4) The fearless yet judicious cutting of rates where they are actually effective in keeping up prices, such cuts to be made with careful regard to conditions within the industry affected, yet without undue tenderness for producers, and with careful consideration of the effect on the revenue.

Such a moderate program of tariff reform stands far more chance of enactment and of continued support from the people than would any indiscriminate slashing of rates for the sake of lowering prices, any attempt by repealing duties to stick a knife under the ribs of monopoly with the probable result of slaughtering small competitors, any effort to drive that mysterious creature "special privilege" out of the lair in which he hides. An industrial structure built up over half a century is not to be re-made in a day, and the Democrats will do well to remember that an intelligent and moderate beginning in the difficult process of readjustment will be both better politics and better statesmanship than a rash attempt to redeem too optimistic campaign promises.

Columbia University.

The Fool

By Mary Eleanor Roberts

There's a fool runs the mission, that place on the pike,
For darkies, and dagoes, and bums, and the like,
And if I had his job, why I'd go on a strike.

With coal at eight dollars, and working alone,
All smiling, and eager, and thin as a bone,
"For the Lord," so he says, "will take care of His own!"

And the ghost of a coat, and a stitch in his side,
And his eyes bright and starved, and his boots gaping wide—
I got tired of waiting for Thee to provide.

So I sent him a check; just to shame, it might be
Such a God by an out and out sinner like me;
But he fell on his knees and gave thanks unto Thee!

Philadelphia.

The Fiction Factory

How a Man Writes and Sells Over Half a Million Words a Year

By George Allan England

[The most remarkable characteristic of modern literature is the rising flood of fiction. In the United States alone about a hundred novels and two thousand short stories are publisht every month to say nothing of those not thought worth printing. Yet the demand is still greater than the supply as is proved by the great rise in prices paid for fiction in the past few years, and by the number of young men of education and ability who have in consequence been drawn into this field. The fertility of invention and facility of composition shown by some of the writers for the story magazines is a constant marvel to the uninitiated. We asked one of the most popular of them "how he did it" and he responded with this article which explains so clearly his method that doubtless any reader can do the same if he wishes to. Among Mr. England's best known serials are *The House of Transmutation, The Elixir of Hate, Darkness and Dawn* and *The Golden Blight.* Of his hundreds of short stories many have been translated into Italian and Danish. In reply to our request for some autobiographical data for an introductory note he sent us the following, which the editor, with unusual modesty, thinks is better than anything he could say himself and so quotes verbatim from Mr. England's letter: "Here's who I am: Age 36, son of an army officer, born in Nebraska, Harvard A.M. Got Bowdoin prize for my *English Petrarchism,* a study of the influence of Petrarch on Elizabethan sonnet-sequences. (No publishers have ever been willing to print this.) First heard of in 1900, when I won the 500 franc prize of the New York *Herald,* with my translation, in verse, of *La Course des Grands Masqués.* Have been a Socialist 8 years. In 1908 ran for Congress; 1912, for Governor of Maine, on the ticket. Both times defeated by largest pluralities ever given in State. Overwhelmingly the most unpopular man in the country, politically. Intend to keep on, and be elected school committeeman of Pinpoint Corners in 1948. I guess that's about all I can think of. Oh, one more point: Publisht *Underneath the Bough,* a book of verses, in 1902, and lost only about $250 on it, A real triumph."—EDITOR.]

Just the other day, the editor of THE INDEPENDENT put a new idea into my head—which is certainly a fit and proper function for an editor. He suggested to me the possibility that a view of the fiction-wheels actually turning, in my factory, might be of interest to the public. Tho naturally of a shy and shrinking disposition, and averse to dispelling popular ideas of the writer, in general, as a creature of fine inspirational frenzy (substituting therefor a real mechanic, prosy and practical), still I shall open the door and bid ye all come in and look around. You shall witness the cogs grinding, the buzzsaws humming, the sawdust flying and the finished product—all masterpieces, of course—shooting out into the bin. Also shall you hear the gladsome clink of silver; tho banish the thought that any writer really considers money a vital factor!

This being a personal narrative involves an almost Rooseveltian use of the vertical vowel. With which general apology, here goes!

Imprimis, my being a fiction-smith is all an accident, like most careers. I planned to be a professor and wear spectacles, also write Ph.D. after my name and be very wise. Instead, I have neither the Ph.D. nor the spectacles. Fate willed otherwise. She let me get as far as A.M., and then diverted me into the insurance business, where at least one can earn enough to eat on. My rôle was advertising-man and writer of insurance-puffs. In describing the wondrous advantages of insurance and dispelling its disadvantages, I received my first real lessons in imaginative writing and the forging of fiction. Beside this training, all my Harvard English work paled into insignificance.

After a year at this supremely excellent preparation, ill-health laid me low. I had overstrained my imagination. I retired to the woods of Maine, curled up and proceeded to starve, or near-starve, at any rate. But the gnawings of poverty inspired further effort. The idea of trying a hand at the short-story game dawned upon me. I wrote my first story on scraps of brown paper, with a pencil, copied it out on a near-typewriter, and sent it to *Collier's.* Pretty soon $100 came back, whereat I near-fainted. After that, the wheels began to buzz in earnest.

The Building of the Factory.

My plant was very primitive and crude, so I set to work enlarging and improving it. *McClure's, The American Magazine, Harper's* and other publications began accepting things, and the machinery began to turn rapidly. I commenced constructing my method. Nobody taught me; I was far away in the wilderness, and had to make my own tools and equipment. I began observing and taking notes, read-

ing the papers with an eye to striking situations, keeping scrap-books, and in general collecting data from the environment. The rough-and-ready Maine woods-life was crammed with local color. I annexed much of it, and landed a series of Maine stories on a whole string of magazines. And the money kept coming in at a rate which surprised nobody as much as it did me.

After a while, a good fairy crossed my path, in the form of one Robert Hobart Davis, "Bob" Davis, who edits, builds, molds and cradles in the hollow of his palm a number of magazines for Frank A. Munsey—just how many magazines, even he himself doesn't know. Mr. Davis invited me to go fishing with him, in a driving rain, on a very deep Maine lake. He sat in one end of the frail canoe, I at the other. He weighs 592; I weigh, well, something less. He talked contracts with me, and rocked the boat gently. So I closed with him. I loved life then, even as I love it now. Also, I could not swim. From that narrow escape, the truly large aspects of the factory-building all date.

THE FACTORY IN OPERATION
George Allan England, one of the most prolific of American writers of fiction.

How It Is Done.

Bob Davis put the scenario idea into my head. That is, the concept of working on approved orders, along a definite plot already agreed on between publisher and author. True, I still "free-lance," but only as a by-product. My solid, bill-paying work is all done on orders, according to the plans laid down by the good fairy and me.

The scenario, then, came to take a definite place alongside the note-books and the clippings. On this tripodal arrangement, plus an avid observance of human life and nature and a habit of pounding the typewriter-keys many hours each day, Sundays included, rests the ever-growing work of my fiction-shop. Genius, avaunt! "There's nothing to it." Method and sweat, these solve the riddle of the meal-ticket.

My eye is ever open, also my ear, for every bit of good material coming my way. Into the note-book goes now a bit of scenery, a face, a phrase, again some new idea, a plot-germ, an odd garment, a deformity, a beauty. The *olla podrida* receives all; and in good time, each bit is fished out and consumed. For example, I open the book at random and read:

Aug. 21, '12.—Man on boat, dark Dago; hair gray, brushed back; eyes slant up, heavy lids; thick, up-curved lips, mustache waxed up, goatee, swarthy, handsome, looks like Pan.

(He'll be the villain in some still-unwritten tale.)

Sep. 1. Sea-view.—Dappled white and slate clouds, breeze, sun in dazzling shine, beach wet, black, green, shiny; seaweed smells. Weed, lank and wet. Haze over beach. Big surf makes lather. Sea very pale green, running to white at top of wave. Thunder of surf, mist of spray, wind from surf in face.

(This will form part of the scene of reconciliation between M. and N. at some future date.)

Gormin'. Any God's a-mint o' things to tell ye. Swell up on your leavin's. Make longs arms. All puckered up to a goolthrite. Double up the prunes! All of a high to go. He ain't goin' to stan' it a gret sight longer. Jillpoke. Hotter'n a skunk. Fatter'n a settled minister, etc., etc.

(Local color stuff, Maine dialect.)

So much for the minutiæ. My books contain a world of every kind of "property," like that at the stage director's hand. No situation can arise where I cannot find a character, scenery and dialect to fit the case. Now for the plots.

"Where Do You Get Your Stories?"

Everywhere! The writer who is alive, can pick up stories right from the air. On trains and boats, from the newspapers, from the living speech of humans, from a thousand and one sources, good fiction can be culled. All you have to do is to watch for it—and grab it. And after years of work, the watching becomes second nature; you can't help it. Writers are just big tom-cats stalking plot-rats thru the attics and cellars of life, or sitting at incident holes waiting for the story-mice to pop out. It's so easy! Sometimes a chance bit of conversation will detonate a whole story or series of stories. About two years ago I took a morning walk with a friend. We got to speculating on what would happen if all the people in the world were killed, save two. From this germ has grown a trilogy of serials. Two have already been published in the *Cavalier*, and the third is now in course of preparation. They are *Darkness and Dawn, Beyond the Great Oblivion* and *The After-glow*, and they have kept bread and cheese on the shelf for a long time.

The Scenarios.

They weren't written, of course, without careful planning and the previous construction of scenarios, in collaboration with the Good Fairy Davis aforementioned. ("Some" fairy!) All serials have to be approved in detail, before I do a word on them; then they're practically certain to sell. There's no sense in running the fiction-factory on any uncertainties.

What does a scenario look like? This:

THE GOLDEN BLIGHT.

Characters: John Storm, young scientist; Murchison, billionaire; Maximilian Braunschweig, Jewish financier, etc., etc., (many other characters).

Scenes: Edgecliff, N. J.; New York City; Washington, D. C.

Action: Storm discovers a method of turning all the world's gold-supply into ashes. He demands that Murchison shall take steps to put an end to war, on pain of ruining him and the entire capitalist class, and overthrowing capitalism. Murchison refuses, and defies him. Storm demonstrates his power. At a great banquet given by Murchison, Storm projects his power and turns all the gold-plate and ornaments to dross. A hasty meeting of financiers is called, and plans laid to kill Storm. But he foils all plots, and continues his work of destruction, with repeated demands that the capitalists yield, etc.

The entire scenario occupies perhaps 1500 or 2000 words, and of course is far too long to quote here. These few lines will, however, serve to give some idea of this particular piece of machinery in my shop.

The Golden Blight was begun on January 1, 1912, and finished on March 5. It sold for an even $1000. If you're interested to see how war was done away with and the coöperative commonwealth brought in, you can find it all told in *The Cavalier*. My best record so far is $200 for a story written in two days.

Some Personalia.

I don't believe in driving the machinery too hard and running a risk of wearing it out. After it has turned out 3000 words for me, I shut the shop for the day and go for a walk, a skate or a run in my auto, which was bought with part of the proceeds of a single story. About once in two years I go to Europe, picking up still more books full of data, people and plots. I find these trips pay about 200 per cent dividends, in cash.

I'm always at it, the rest of the time. I take no Sundays off, nor any regular holidays. The shop runs best in daylight. Lamplight seems to dull the product. Tobacco is a prime necessity as a lubricant —lots of it, all kinds, the ranker the better.

In between the serials, of which I write two or three a year, I sandwich dozens and scores of short stories. The factory can turn out about two short stories a week, or three, if need be. Occasionally I do a novelet, running from 15,000 to 20,000 words, as a kind of *apéritif* for the longer novels. The little odds and ends of time are chinked in with moving picture plots, good for $25 apiece and taking only a few minutes to frame; also with "knitting work" in the

shape of juvenile stuff, boys' stories, small illustrated articles on how to do things, and so on. *Nulla dies sine linea* makes a good working motto. On a par with it is, "Every little bit, added to every other little bit, makes just a little bit more."

I rarely rewrite to any extent. The great majority of my product goes into cold type just as the fiction shop machinery has produced it. My special treat is writing about three or four serious essays and articles a year, on economics, Socialism or current events, for THE INDEPENDENT, *Review of Reviews, Twentieth Century Magazine* or some other review.

This material I rewrite very carefully. can afford to, as it is my prime dissipation. My principal vice is writing verse, but I can never sell any. Verse, for the usual fiction writer, won't buy matches to light his indispensable pipe. Of course I write endless stuff for the Socialist press, but most of this is given away. Every factory has certain by-products. These side lines are mine.

Vital Problems.

A few important problems arise in the shop. Am I a capitalist or a proletarian? Nobody can tell me. I own my tools of production—my cortex and typewriter—but at the same time I employ myself and exploit my own labor. So I'm both slave and master. It's confusing. Then, too, arises the matter of dissociating myself from my work. As time passes, I find the factory more and more absorbs my personality.

The business makes one cold-blooded. From observing other people and outside events, all with an eye to fiction, one comes to observe one's own self and acts with a similar view. One begins to capitalize one's own emotions, which is shocking.

No longer can I enjoy a sunset, an opera, a foreign town, a friendship or a flower with disinterested frankness. No, always the shop intrudes! The notebook ever itches to be in the hand. Alas! I leave the reader to figure it out for himself. When one's own woes and blisses, romancings, hates, loves, ambitions, passions, begin to assume the notebook stage, wherein lies any spontaneous enjoyment of life? Ask any writer, and—if he be not a "short and ugly word" fellow—see if he won't tell you that his inner shrines have really become an annex to the shop!

There lies something fundamentally tragic in the drying of a tear with the thought: "No matter—even this grief, too, will make good copy!"

Genius?

How small a role it plays in modern fiction! Perhaps it still exists, in certain attics; but it doesn't habitually ride in motors or smoke cigars. No, gasoline and nicotine come to a well regulated shop rather than to a stable which houses Pegasus on musty hay.

Perseverance, notebooks, cold-bloodedness, scenarios, contracts, many hours a day in the factory, an observant eye and some knowledge of what the public, "that big baby," really wants—these supply the lack of genius with most satisfactory sufficiency.

Some day, when I am very, *very* rich—oh, worth maybe $5000—I'm going to be a genius. Till then I shall remain a mechanic, sawing wood like any other, making the chips fly, capitalizing myself and everybody and everything else I can get my hands on, and in general enjoying life thru the very function of trying to interpret it.

Everything and everybody must pay toll to me and go into the notebooks. Even the editor of THE INDEPENDENT, while he was ordering this article, was being crammed into the mental pigeonholes, marked "Hero."

Is it all made clear? I fancy so. To the best of my knowledge, nothing more remains to confess. So, having made a clean breast of everything, I turn back once more to my daily task of sawing the wood of contemporaneous fiction.

South Paris, Me.

An Abridged Bible

A Plea for a Shorter Bible to be Used in Home, School and Church

By B. F. Beazell, D.D.

[The author of this article is a Methodist Episcopal clergyman, greatly interested in the religious education of the young.—EDITOR.]

The children of this world continue to be wiser than the children of light. Teachers in schools of lower and higher grade find pupils so generally unacquainted with Bible characters, and particularly with its stores of apt, quotable literary gems, that especial effort is being made to supply this deficiency.

An appreciative reviewer says:

> It is a significant fact that so many textbooks for secular use have appeared in recent years upon the study of the Scriptures as literature. It signifies, primarily, such a defection in old-fashioned Bible familiarity that it is necessary to supply this gap by international study courses. What cannot be supplied by such a mode of study is the reverent atmosphere of the old method of approach to the Bible, so that it spoke to the spiritual imagination.

Protestantism is eagerly interested in popular education. Is it willing, however, that the first and most alluring knowledge of its Book should come to its young people in the schools rather than thru the home and church? When selections are made for their literary merit chiefly, the religious element is likely to be denatured or eliminated.

But, say many, there are serious objections to any abridgment or rearrangement of the sacred writings. In reality this work has gone on, in some form, thru all the Christian centuries.

When the Old Testament was given its present form, eighteen hundred years ago, what reams of old parchment were set aside! Missionaries wisely carry only portions of Scripture into the dialects of their people. The New Testament and the Psalms furnish a convenient volume for thousands of households. The responsive readings of churches are selections; very narrowly gleaned, it must be confest. The whole modern system of Sunday school lessons is an abridgment of Scripture.

Dr. William Newton Clarke attained high rank as an expositor and theologian. Two years before his death, after reading his little book, *Sixty Years With the Bible,* I suggested that he ought to edit a volume of Old Testament scripture containing such portions of the Pentateuch, the histories, the Psalms, the wisdom literature and the prophets as would enable the common reader to pass on toward the crowning event of all scripture, and of the world—the coming of the Divine Man.

He fully agreed with me that such a volume was needed; said he had thought of attempting something of the sort, and that the only hindrance to the usefulness of such a work would be popular prejudice.

One of the most effective Sunday school teachers of our time says:

> It would be desirable if we could have an abridged edition of the Bible for use in the Sunday school, from which all portions having no especial educational value might be eliminated, and particularly from which some portions might be omitted which, for indiscriminate use, I feel are often harmful.
>
> I fear, however, that we could not secure consent for the use of such an abridged Bible, as a good many people would at once say that we were emasculating it, and those who entertain a sort of superstitious conception of the Book have a feeling that everything in the Bible, simply because it is there, is sacred and should be studied by all people of all ages. Gradually we are coming to see that we must use the Bible intelligently and with discrimination.

Prejudice! Superstition!

The Jews of the first century braved and disregarded these when they gave the world its present canon. Are Christians of the twentieth century, because of popular superstition and prejudice, to refrain from placing the essential teachings of their Book in such form that it will not pass from common use?

Sentiment and lifetime associations are valuable things in their place When they block the way to truth-seeking and the gaining of saving wisdom they are positively harmful.

No one proposes to supplant the old Book. The abridged dictionary does not supplant the unabridged; it advertises it. The single volume which carries child or man easily and quickly thru the outstanding events of the nation's history, from Plymouth Rock to Appomattox, sends its reader with zest to the great volumes of the library. Discriminating, thoughtful minds will suggest various reasons for an abridgment that would aid the ordinary reader. For it is the giddy child, the indifferent, listless man and woman, the Church must always aim to interest and instruct.

Printed, as it should be, in clear, bold type, the old volume is too bulky. The ceaseless productions of the press inevitably push the tome aside. Bigness is a serious barrier. There is not a little that should be excluded. Many portions are repetitions. Many had only local and temporary use. Some are unsuitable for public or even private use. Adam Clarke, the great commentator, declared that he could "find nothing in Solomon's Song to promote vital godliness, or cause the simple and sincere not to know Christ after the flesh." Most of the Psalms are sublime, but some are commonplace, a few are unfit; just as in our hymnals glorious utterances of Wesley, Watts and Heber are sandwiched in with mediocre songs. Many of the Proverbs are gems; others have no glint. The vindictive, blood-vengeance records of the histories have always caused the judicious to grieve, while the scoffer exulted. The Old Testament was never edited, but compiled from pre-existing manuscripts, written by various authors thru many generations. In the case of the histories especially, fragments are simply woven into a common web. The modern method of history writing, the careful searching for and weighing of evidence—there is nothing of that. Consequently there are many duplications, some inaccuries, and in parallel narratives, as Kings and Chronicles, there are frequent divergencies. But the enormous bulk of this ancient ceremonial law, history and prophecy!

One can easily imagine a pious, thoughtful Hindu saying to his missionary friend:

> When I embraced Christianity I laid aside the endless series of sacred books of my own people. Why should I, in order to be a true disciple of Christ, be asked to search thru the mazes and repetitions of the ancient Hebrew writers? They are dead as a nation, and as a race seem not to have been greatly benefited by their own teachings, and are today harder to win to Christ than we Hindus.

The average man of any race is likely to think the same. Rites, ceremonies and local laws have archaic value chiefly.

The histories, by scientific, wise compression, could be reduced by half. Sixteen books of prophecy there are, some very small, others quite large. The prophet, it is now recognized, proclaimed what would eventuate under certain contingencies. Under the theocracy he was a preacher-statesman who charted the safe, righteous course the nation should follow, and the penalty of refusing to be guided by Jehovah. Lodged in these impassioned pleadings and threatenings are principles and inspirations humanity must never lose. They may, however, be grouped within much fewer chapters. Truth needs to be reset for each oncoming age.

The Master annulled some utterances, and reinterpreted many others. The tremendous responsibility He placed upon His disciples of binding or loosing such as seek admission to His kingdom must never be forgotten. Zealous ignorance binds, but never sets free.

Who today reads the Bible regularly? is a question often asked with anxiety. Few, we fear, and they such as need its counsel least. Multitudes seldom see it, never become acquainted with it, even by handling and looking thru its pages. Leaves, nothing but leaves, for the young life of the Church. Truth seldom sticks unless visualized. The eye, as the spirit's helper, must not be ignored. Lips, tongue, voice, quickly rivet sentences in the memory.

Mr. Edison, it is said, is putting his enthusiasm and millions of dollars into a great scheme for revolutionizing public instruction by means of moving pictures. Much may be expected of this. Think of the healthful enthusiasm that might be carried into the Sunday school by a wise use of the camera in Bible lands! The environment of patriarch, psalmist, evan-

gelist and the Master could be vividly reproduced. Fancy teacher and scholars sitting together for forty minutes reading together, audibly, each from his own book, the boy life of David. Then, moving before them, home and tent life, shepherd, flock, desert, stream, mountain, the starry heavens and the wild beast. Jonathan, David, Saul, Goliath. The mental pictures carried from book and canvas would never fade.

What book is this?

It is an abridged Bible, in clear type, with marginal references, and brief, illuminating footnotes; the essential teachings of the Old Testament, synchronized as far as possible, together with the books of the New; the gospels combined into a harmony. Such a volume, however, must please the individual and family, as well as the school. It has not yet been constructed, but it will be; it must be. The materials are at hand; translations, references, assured information for footnote illumination.

The doers of this gracious work may well have much of Emerson's two halves of culture—the world of books and the world of men. Yet having that only would mean failure. The supreme equipment must be a true spiritual conception and sympathy, that the religious imagination of all kinds of people may be enchained and nourished. Paul's declaration must always be the test: "Every scripture inspired of God is profitable for teaching, for reproof, for correction, for instruction, which is righteousness." Few will insist that the Bible is as profitable for instruction in righteousness as it might be.

Why should it be thought an incredible thing that a Christian council in this century should be able to fashion a more inspiring book than a Jewish synod in the first century? Surely Protestantism will recognize its high privilege and responsibility. For generations the heart of humanity has turned to it in all struggles for national, social and spiritual betterment. The vital, inspiring messages of the old Book, put within easy reach and comprehension, His saving health will more quickly and certainly be known among all nations.

Belle Vernon, Pa.

Lincoln and Compulsory Greek

By C. Grant La Farge

[We are glad to be able to present to our readers this able defense of the Bacon design for the Lincoln Memorial at Washington, which we criticized February 6 in an editorial entitled "How Lincoln Would Have Laughed." Mr. La Farge was associated with his father, the late John La Farge, in the architectural work of the Cathedral of St. John the Divine and numerous churches and mausoleums and other buildings in all parts of the country. He has been president of the New York Chapter of the American Institute of Architects and of the Architectural League. We comment upon his point of view in the editorial pages of this issue.—EDITOR.]

How Lincoln would have laughed—yes, how "he who looked with a genial eye on all the follies and ineptitudes of men" would have laughed at the crass ineptitude of those who would make the memorial of his greatness and his deep significance an experiment station for the uncultured commemoration of his mere personal attributes. For that is one question, one of the two strange questions, propounded by those who decry Bacon's noble and scholarly design. They say that it is not a fitting memorial of Lincoln. Why? Because it is based upon tradition; because it is scholarly; because it is a "temple"; because it exhibits him as a pagan deity.

What is it, then, that we commemorate? Apparently, if one must follow their line of reasoning, it should be his uncouthness, his humble beginnings, a certain almost Rabelaisian quality of his. These are the merest externals. It is not because of these that he lives, a resplendent figure, in the minds of men, and it is not these that should be perpetuated here in this enduring shrine. For when the assassin's blow sent his frail mortal body to its long rest, there rose from its poor clay a figure destined to grow in glory with the passing years; to be stript of all that was sordid and temporary; to stand forever among his peers, the eternally great—great for

their common possession of the heroic qualities which know not time, nor place, nor race, nor condition.

He would have laughed, you say, at the following of tradition, what you so cheaply call "imitation." Would he? What was it that the gaunt hobbledehoy studied when he wished to form *his* style? He did not try to invent a new language, to cut loose from the examples of a classic past. With an eagerness not to be thwarted by obstacles or ridicule from the narrow-minded world in which he lived, he sought that past. Read the story of his reading, and then read again the Gettysburg address. If the Doric order is not there, then our tongue has no form or rules.

His effigy, you say, should not stand in a temple. Well, this building is a temple only by implication. It certainly is patterned on no classic form of temple, except in that it has a colonnade about it. But grant that it recalls a temple. It is not the body of Lincoln that is here to be set before our gaze, it is his spirit. Since men began to honor their great dead and exalt their memories, they have found no nobler expression of their sentiment than the monumental edifice. They know today no graver form, none of greater dignity, none more abstract, freer from a connotation that would verge close upon blasphemy, than one based upon the models of classic antiquity. And they know none more appropriate, because of the roots from which spring their law, their literature, their art and their learning of today. If this place to which shall come the generations of our country to do homage, to learn a great spiritual truth, to revere a splendid soul, shall appear to be a temple, then indeed it is well.

We are told that Lincoln will be made to appear as a Greek deity. Any statue of a hero under a colonnade is a Greek deity, then. Very well, a statue in the open air is a Greek deity; a statue in almost any place is a Greek deity. The only thing that prevents our taking the statues in Central Park, or in the various "circles" of Washington, for Greek deities is, perhaps, that they are not chryselephantine! It is probably some dulness of comprehension that debars us from realizing the truth, that the figure, alleged to be George Washington, on the steps of the Sub-Treasury in Wall Street, is really Jupiter Tonans, or perhaps Augustus Cæsar.

What insufferable nonsense! But it ceases to be nonsense, and becomes a sheer insult to the intelligence, when we are requested to believe that Lincoln would not have taken the stand he did on the slave issue had he been subjected to compulsory Greek. This is a pretty comprehensive insult, for it is directed not alone at us, but at Abraham Lincoln. Think what it means: that he—wise, patient, suffering soul, seeker thru all his days for learning and great example, shrewd disentangler of truth from sophistry—would had he in his youth been brought into the high company of the great poets and reasoners from whom flow the undiminished rivers that still refresh our thirsty minds and hearts, have been deluded into following the paths of cruelty and oppression. And you, who think this of him, think you are fit to counsel us! You would have us, we take it, believe that among those who so nobly gave the last full measure of devotion, were none who were taught the humanities. You would persuade us to ignore all the long centuries of man's slow growth, his struggle upward toward perfection; to set aside, as of no worth, all his experience of the need to follow in known and proven paths if his footsteps shall lead him to any sure result. You would have us substitute chaos, ignorance, lawlessness, and a carnival of eccentricity, for decency and order.

You say that this design is alien. We reply that its origin is the common heritage of civilization, of which we will not be despoiled.

You say that as it is Greek, so is it dead. We reply that great art never dies.

> Tout passe; l'art robuste
> Seul a l'éternité;
> Le buste
> Survit à la cité.
>
> Et la médaille austère,
> Que trouve un laboureur,
> Sous terre,
> Révèle un empereur.

Solving the Negro Problem in Detail

How One Colored Man Made His Way to the Front

By Booker T. Washington, A.M., LL.D.

Scarcely a week or a month goes by that I do not find on my desk a letter, a pamphlet or a book in which some one has tried to formulate a solution of the race problem. Many of these letters and pamphlets contain valuable suggestions, and, so far as I am able to do so, I read them all, read them with interest and, I hope, with profit. As a rule, however, it seems to me that these solutions have one common fault. They start out apparently with the notion that the Negro is a fixt quantity, always and everywhere the same, and then proceed as if the race problem, like a problem in arithmetic, could be solved once and for all by a mere process of reasoning, once you had defined all the terms.

WATT TERRY

Who, starting work with a capital of twelve cents, twelve years ago, now has a gross income of over five thousand dollars a month.

The trouble in this case is that, like other human problems, the race problem is one in which the terms are not fixt and cannot, therefore, be brought into the shape of a hard and fast formula.

For my own part I have long ago given up the notion of solving the race problem wholesale. It seems to me rather that it can only be solved in detail. It is for this reason that I find myself interested in the progress of the individual Negro quite as much as I am interested in the progress of the general average. The colored man who breaks a record, who does something new and better in his particular line than any other colored man has done before, is not only widening the opportunities of the race, but he is encouraging others to follow in his steps. What one man has done another may do.

Recently I have run across two instances of Negro progress which are interesting in this sense. One of them is that of an individual colored man in the North and the other that of a Negro community in the South.

During a recent visit to the western part of Alabama I passed thru a little farming village known as Uniontown. This town, which has a population of only about 2000, is the center of a farming district in which there is a population of about 50,000 white people and 220,000 Negroes. Uniontown is the metropolis of this region. On Saturday afternoon, when all the farmers from the country for twenty-five miles around have come into town to bring in their produce or secure their supplies, it is one of the most lively communities in the State. The remainder of the week, however, is correspondingly quiet.

It was for this reason, perhaps, that Uniontown, which has the reputation with colored people of a town in which

Negroes do more business in proportion to their numbers than any other town in the South, is noted also as having the only wholesale grocery store conducted by Negroes in the United States. The advantage of conducting a wholesale grocery in Uniontown is that in that case it is possible to do business six days in the week, while a retail store is very largely confined to one, the Saturday market. About six years ago the firm of Eldrige Brothers, which had for a number of years been doing a retail business at Uniontown, began selling groceries in quantities to some of the smaller stores in the surrounding country. This gave the firm an opportunity, as I have said, to do business for six days in the week instead of one. The business, begun in a very small way, prospered. As yet the total amount of business done does not amount to more than $40,000 a year, but it is, as far as I can learn, growing steadily. The firm now keeps one traveling man on the road, and the wholesale business at the present time represents three-fourths of the trade of the firm. It has, in fact, grown to such an extent that Eldrige Brothers are now planning to give up their retail business altogether.

I wish that I had time to tell in detail the whole story of the growth of this business, how step by step the father, who had been a slave, starting with a little shop in a side street, picking up here and there, and often by hard experience, some knowledge of business methods, finally moved into the main street of the town; of how he sent his two sons away to school, one to a business college and the other to a medical school; of how upon their returning, one of the boys entered the business with his father and the other started a drug store in connection with his practice as a physician, and how finally these young men have won the respect of white as well as black people until they are now counted substantial citizens of Uniontown.

There are about thirty other Negro business men in Uniontown. In numbers, at any rate, Negroes represent nearly half of the business enterprises of the town. In every case they are natives either of the town itself or of the surrounding counties, and in every case they have been assisted and encouraged by the white business men of the town. One of them, for example, a blacksmith, now runs the business in which he formerly worked as an apprentice and helper under a white man, who, when he left Uniontown to go to Birmingham, sold out his business to his Negro assistant on easy terms. I wish that I might describe, also, the condition of some of the Negro farmers living in the neighborhood of Uniontown, many of them conducting large plantations of their own. I might add, also, that if the white people have assisted and encouraged the thrifty Negro members of the community, it has not been merely a philanthropic interest which led them to do this. Negroes have, as I have been informed, not less than $70,000 deposits in the three white banks of the town, and there has never been a lynching in that neighborhood.

The other instance of Negro progress to which I have referred is that of Watt Terry, of Brockton, Mass. Watt Terry told his story at the last meeting of the Negro Business League in Chicago. Mr. Terry is a modest appearing young man, about thirty years of age. When he landed at Brockton some twelve years ago he had, according to his own story, a capital of just 12 cents. He found work at first as a coachman. After a time he obtained what he thought was a better position as janitor in the Young Men's Christian Association Building. Some of the members of the association then succeeded in getting him a position as a railway porter.

"Somehow or other," said Terry, "I did not care for that sort of work and after a few months gave it up. I made up my mind that I would rather work at a trade and tried to get work in one of the shoe factories in Brockton. As I did not know the trade and there was a good deal of competition for the places open to apprentices it looked rather hopeless at first. Finally, I got the foreman to say he would give me a chance, provided I was willing to work for two weeks without pay. I accepted that offer and made up my mind to make the most of those two weeks."

At the end of the two weeks Terry

had done so well that he was given a position in which he earned $7 a week. By sticking close to his job and making the most of his opportunities he was gradually promoted until he earned first $10, then $15, $18 and finally $25 a week.

"I had some difficulties at first," said Terry. "The other men did not like me at first and showed it. However, I stuck to the job, kept on smiling, and it was not long before I was on just as good terms with the men in the shop as I cared to be. As I did not have much opportunity to spend my money I found it easier to save."

When Terry reached the point where he was earning $25 a week his wife was earning $9 as matron in the Brockton railway station, and they both saved their money. Meanwhile Terry had begun to buy and sell real estate in a small way. One day he sold a house and lot upon which he cleared as a commission $100.

"That seemed to settle the question of my future," said Mr. Terry. "I decided to go into the real estate business."

He added that at the present time his gross income from his houses was between $6000 and $7000 per month. Altogether, including several store buildings and two apartment houses containing fifty-four suites of rooms, Mr. Terry now owns 222 buildings in Brockton. One of these buildings is leased to the United States Government for the use of the post office; another is rented for a public library and reading room by the city.

I should not, perhaps, have dared to make this statement if I had not confirmed the truth of Mr. Terry's statement by independent inquiry. In a recent letter from Secretary White, of the Brockton Young Men's Christian Association, he says: "Some weeks ago I wrote you relative to our mutual friend (Watt Terry's) business, but now I want to enclose a clipping from the tax list which you will see is positive evidence that the time the taxes were recorded he was carrying well on to $300,000, and I know that his purchase of $120,000 occurred since that time. It is certainly a most wonderful development within a few years."

I ought to add that during all the time that Mr. Terry has been in Brockton he has been connected with the Young Men's Christian Association, and not long ago he contributed $1000 toward the support of that institution.

Many persons will, perhaps, feel that money which is acquired in this rapid way is likely to do the person who obtains it as much harm as it does good. I confess that it seems to me that the same amount of money acquired more slowly would mean more in character to the man who gained it. On the whole, however, the Negro race has not reached the point where it has been troubled by the number of its millionaires. And if getting slowly and laboriously is a good discipline, the Negro has almost a surplus of that kind of blessing. I ought to add, also, in justice to Mr. Terry, that from all I can learn, his rapid rise has neither injured his character nor destroyed his good sense. I suspect that the effort to keep all those houses rented and the effort to pay interest on his mortgages has had a tendency to make him humble.

Tuskegee Institute, Alabama.

Chemists

By Ralph M. Thomson

Hate compounds with cunning craft,
  In his noisome beaker,
An intolerable draft,
  Sickening to behold;
And as souls the deeper drink
  They become the weaker,
Until Time, from whom they shrink,
  Counts them with the old.

Love distils in his retort—
  Love, who labors longer—
Potions of the purer sort,
  For all hearts unstrung;
And as famished mortals sip
  Do they grow the stronger,
Until Age, of ashen lip,
  Comes, to find them young.

Savannah, Ga.

The Making of Woman

(The idea of this poem is founded on an ancient Asian tradition of mythology).

When now the high gods had perfected man,
The making then of woman they began;
But no material durable was left,
So from the slight and subtle she was weft.
And they took counsel; for her soul was drawn
The mystery and the moment of the dawn.
And for her fragile face they sagely took
The primrose opening pale with upward look;
And for her motion stayed a fleeting star,
Therefore so bright she seems and so afar!
They gave her the first leap of the loosed deer,
Then rustling secret of the fringed mere,
And elfin-mischief of the guilty glade,
Lighting wherein a mortal grows afraid.—
The dance of fays upon illumined bank,
The frolic, and the freak, and moonshine prank.
The tremble of first dew upon the grass,
The yearning of the moon as she doth pass;
Then the suspense of the o'erbrimming billow
And dream of moon-breeze upon wild flower pillow.
They gave her golden music's dying strain,
The quiet prattling mercy of the rain.
They stole her heavy sorrow from the sea,
And yet from running brooks their laughing glee;
And thus with subtle touch and yet most sure,
They fashioned a frail thing that shall endure.

Stephen Phillips.

THE NEW BOOKS

The Chinese Republic

Unlike a hundred other authors of books on the Middle Kingdom, who have written of China's intellectual awakening and educational progress, and who hold a high opinion of the leaders of the new republic, Mr. Bland, in *Recent Events and Present Politics in China*,[1] says that the establishment of the new Government is a farce, and that Dr. Sun Yat-sen is a dreamer of dreams, a "blind leader of the blind."

Mr. Bland opposes the anti-opium movement; condemns the sympathy of the Anglo-Saxon for "the under-dog"; reproaches Americans for sending missionaries to the East; calls the Chinese "stupid people"; denounces the sympathetic European and American press for giving moral support to the new Government; and predicts for China more revolution, corruption, foreign interference, and partition. His book contains fourteen chapters, dealing with the causes of Chinese unrest, the passing of the Manchus, Young China, the policy of the Powers, and the opium question. It would have greater worth if the British author did not give so one-sided an account of the Chinese revolution and the establishment of the republic. One cannot refrain from marveling at his finding "no bright spot in the process of the new republic, no self-sacrifice, no patriotism, no honesty, only nepotism, bribery, extortion"—all more unbridled under the republic than under the monarchy.

Tho the author of *Recent Events* must be accounted an authority in matters Chinese, we are reluctant to accept his assertion that the revolution was merely the accidental triumph of a set of politicians, hot-headed students, and office-seekers. Such writers as Mr. Arthur Brown, Dr. C. W. Eliot and Dr. Morrison regard it, rather, as a triumph of patient, far-seeing organization. Nor can one accept the statement that "the leaders of the new Government regard the employment of Europeans in positions of authority as a waste of money or a loss of face." Dr. Morrison is at present acting as adviser to the Chinese Government, Professor Jenks has been offered a directing office in the Chinese Treasury, and other Europeans and Americans occupy positions of authority in the Celestial Republic.

Mr. Bland prophesies that "Young China will pass, the shadowy fabric of a restless dream. An inevitable reaction will restore the ancient ways, the vital Confucian morality and that enduring special structure whose apex is the Dragon Throne." The English historian seems definitely to prefer the system of limited monarchy to that of republicanism, and believes the former to be the proper system for the Chinese, above all, because, he says, they do not understand representative government, and the great body of the people have had no voice in the election of their alleged representatives. In contrast with this view we have that of Professor Giles, who sees China as "a great democracy living in the greatest republic the world has ever seen." And there is certainly evidence to show that the Chinese do manage their own affairs, and the affairs of their villages, by the simple expedients of local self-government. With the aid of a local press, the formation and propagation of a public opinion is made possible.

Mr. Bland calls Dr. Sun Yat Sen a born republican, describing him as "lacking historical consciousness, unredeemed by the European's attitude." Tho he admires the ex-President's strong character, picturing him as "a man of sincerity, earnestness and high enthusiasm for ideals," he regards him as a visionary, like Danton. Wu Ting Fang, formerly Minister to

[1] *Recent Events and Present Politics in China.* By J. O. P. Bland. Illustrated. $4. Philadelphia: J. B. Lippincott Company.

the United States; T'ang Shao Yi, Dr. Sun's first Premier, and Wen Tsung Yao are also the subjects of brief biographical and character sketches. T'ang Shao Yi achieved republicanism, and Li Yuan Hung had republicanism thrust upon him, we read.

Mr. Bland shows insight and knowledge in his discussion of the intellectual and political activities of the Cantonese party, due to its geographical position.

According to him, the fundamental problem in the situation is over-population, since there is no outlet for the steadily growing surplus. The United States and other foreign lands exclude Chinese immigrants, while they send missionary doctors to check the death rate, which used to prevent over-population. Evidently Mr. Bland ignores the fact that thru the introduction of Western scientific farming, the food supply likewise will be increased. The author does not hesitate to condemn the Manchus as parasites living in corruption and intrigue, who preserved their Dragon Throne by the constant diversion of hostile elements, and lost it because they were inefficient and ignorant and corrupt. And he blames the British Government for saving the Manchu dynasty by allowing Gordon and "his ever-victorious army" to crush the Taiping rebellion.

In spite of the gloomy and awful future of China pictured by Mr. Bland, the new Government is progressing peacefully and rapidly. Troops have been disbanded to cultivate the soil; the provinces where the crops are very good have begun a regular remittance of revenues to the central government. Evidently the book was written during the Revolution, for now that the republic has been peaceably maintained for over a year its pessimistic view cannot be justified.

The American Spirit

"The American spirit in literature is a myth," writes Mr. Macy, who publishes a series of papers on our more distinguished men of letters, from Irving and Cooper to Lanier and James;[1] "like American valor in war, which is precisely like the valor of Italians and Japanese." Dickens, who writes of London, "influences Bret Harte, who writes of California, and Bret Harte influences Kipling, who writes of India. Each is intensely local in subject matter." Yet California did not "produce" Bret Harte, is the contention; the story-teller rather created a certain kind of California; "and Indian gentlemen, Caucasian and Hindoo, tell us that Kipling invented an army and an empire unknown to geographers and war offices." Does Mr. Macy believe, with Vivian in Oscar Wilde's essay, *The Decay of Lying,* that "Life imitates Art far more than Art imitates Life," that "Life is the mirror, Art the reality?"

However that may be, this would-be revolutionary has written a book provocative of thought and of contradiction. True, its occasional slanginess is the least of its defects; its jerky lack of grace or style, in discussing style, is more grave. "The American literary artist has written about everything under the sun," he says, "except what matters most in his own life." Our literature is, from his conning-tower, seen to be "idealistic, sweet, delicate, nicely finished"; so that one may infer that the essayist finds American life to be, *per contra,* materialistic, sour, coarse, and—this much we grant—unfinished. "There is little of it —*i. e.,* of American literature—which might not have appeared in the *Youth's Companion.* The notable exceptions are our most stalwart men of genius—Thoreau, Whitman, and Mark Twain."

One resists the inclination to protest at Thoreau's inclusion here, for that is what Mr. Macy wants us to do. We are, however, glad to note that he does not altogether despair of the republic. Tho Poe, Hawthorne, Howells, James, Aldrich, and Bret Harte ("admirable in manner") are "thin in substance, not of large vitality," a contemporary literature that includes, among the books published in a single year, Mr. Wharton's *Ethan Frome* and Theodore Dreiser's *Jennie Gerhardt,* reassures him. And most properly. We all lack perspective: and Mr. Macy is one of us. Yet in devoting ourselves to the introductory chapter in which Mr. Macy generalizes about American literature, instead of studying the uneven, rather unmethodical chapters in which he takes up our greater names, one by one, we are scarcely fair to the

[1] *The Spirit of American Literature.* By John Albert Macy. Pp. ix, 347. Garden City, N. Y.: Doubleday, Page & Co. $1.50.

writer. He is much better in his individual appreciations. But why, then, has he given his book the misleading title, *The Spirit of American Literature?*

Children of Toil

It appears from the book of Thomas Robinson Dawley, Jr., *The Child That Toileth Not* (New York: Gracia Publishing Company, 115 Nassau street), that there are "interests" and "interests" connected with the exploitation of the cotton industry of the South, and those that are most reprehensible are to be found where we should look for them last. Mr. Dawley was appointed a special field agent of the Bureau of Labor to assist in the work of investigation into the conditions of labor in the Southern cotton mills, undertaken by the Commissioner of Labor in accordance with an act of Congress in 1907. After some service rendered in both field and office positions, Mr. Dawley was discharged, because, he alleges, he was not able to make his findings agree with predetermined results inimical to the cotton manufacturers and justifying the complaints and accusations of certain social workers and general busybodies who are the real "interests" behind such investigations. Hence Mr. Dawley appeals to the public with his facts, which he declares have been purposely suppressed in the Government reports.

These "facts" are not very convincing. To be sure, the author gives many observations of the life of the people made on his tours of investigation, but there is no systematic presentation and no evidence of a desire to let the facts speak for themselves. Everything brought forward points but one way. The book is largely a panegyric on the beneficence of the cotton mill as a civilizing agent. Far ahead of strictly educational methods or any other means yet tried in the South for building up the manhood, self-reliance and efficiency of the people is this simple, benevolent, profit-paying cotton mill. Mr. Dawley's reiterated message to the millionaire who would become a benefactor of the South is direct and unequivocal: "Build and equip cotton mills." The "investigator" does not seem to have found a single fact or condition that could not be construed as ideal or at least favorable, and all other efforts for social betterment in the mill communities are viewed as filthy rags in comparison with the achievements of the mill and its attachments. The author discovers that even the laws made with kindly intent to protect women and children in this industry have in most cases worked evil. It would be better, we are led to believe, to leave the whole matter to the wisdom of the beneficent mill owners, who, in spite of legal obstacles, are yet working wonders for the uplift of their country. That Mr. Dawley can see an encouraging aspect to almost any situation may be demonstrated from his description of a community notorious for its ignorance, criminality, poverty, shiftlessness and "moonshining," and his declaration that the manner of life there was similar to what he had known in his earlier days in New England.

Mr. Dawley's book is interesting, but does not command confidence in many respects. When due allowance has been made for the author's eccentricities and misinterpretations, however, two significant facts will be brought home to the reader with telling effect: the sections of the South described are in dire need of industrial and agricultural education, and the entire absence of physical employment does not leave a child in the best situation to absorb elementary instruction. The emphasis on these facts is unmistakable, and it is worth having.

How Old Is Man?

Prof. George Frederick Wright, of Oberlin College, is both a geologist and a theologian, and is editor of the *Bibliotheca Sacra.* His special department as a scientist is surface geology, and he has written much in this department on American and Asiatic conditions. As a theologian, he is known as a conservative expander of the accounts of the Creation and the Deluge as told in Genesis. As a scientist, he is conservative; as a theologian, is liberal; at least, not one of the extreme conservatives. For example, in his new book, *The Origin and Antiquity of Man,* published by the Bibliotheca Sacra Co., Oberlin, Ohio ($2), he will not have it that the world is but six thousand years old, nor yet that man was created four thousand years B. C. Indeed, he admits that the Genesis dates are not to be followed and that Egypt and Babylonia had civilized inhabitants four or five thousand years B. C. He connects the Deluge with the breaking up of the Glacial Period, and has given great study to the arguments from erosions, etc., which make the Glacial Period quite late. The present volume gathers all this evidence and presents it as strongly as it can be put and in full detail.

While we cannot unqualifiedly accept the writer's idea that the Deluge of Genesis is to be explained by the glacial floods, we note that Professor Wright does not in this volume assert but rather implies the iden-

tification; for he admits that man began to appear earlier and that the glacial floods must have destroyed multitudes of men whose flints are found in the drift. Such an argument as is here presented must be considered seriously; and certainly for the last decade or two the tendency has been to reduce the antiquity of man, and, indeed, of geologic history. But it must be remembered that the effort to reconcile Science with Scripture rests on a narrow theory of inspiration.

English Society in Transition

E. S. Roscoe's description of *The English Scene in the Eighteenth Century* (Putnam, $2.75) represents an endeavor to treat the subject broadly, without failing to offer enough concrete facts and examples to command interest and some degree of authority. The transitional century offers the social historian a fascinating field, and the chapters on London, Liverpool and Bath; the aristocratic, literary, industrial and mercantile societies; such types as the woman of letters, the naval officer, the country clergyman and the rural laborer, are full of soberly interesting generalization and circumstance. We consider the explanation of eighteenth century morality—that essential coarseness of the times, without prejudice to the spirit of liberty or the love of free play, but related to one or both of these—one of the best passages in Mr. Roscoe's book. The representation of the century en bloc, without much attention to the fact that the dates 1701 and 1799 mark very different periods, is occasionally bothersome; as where we read of the monotony of women's lives, "as yet unstirred by novels."

The high importance of that relatively small body, the British nobility, is, on the whole, justly estimated, and the point is well made that the aristocracy as a class "had no dislike of the people," as it had in France, and was not "a combination of small autocrats and high officials." These English aristocrats were notable art collectors; like our nabobs of today, however, they were shoppers rather than Mæcenases, and their collections of Dutch and Italian canvases, which they purchased on the Grand Tour or secured thru Continental agents, had little or no effect upon the taste of their contemporaries. Affluent representatives of the middle class, who traveled less and had smaller houses, were the better patrons. They it was who purchased "small portraits and homely landscapes by English artists."

Mr. Roscoe's book is well illustrated. We wish, however, that he had given under each reproduction of a print or painting the artist's name and other details of its *provenance*. This would have doubled the interest of his well chosen illustrations.

Woodrow Wilson, Idealist

A baccalaureate address by the President, delivered during his service as president of Princeton University, is issued in a new edition by T. Y. Crowell & Co. under the title, *The Free Life* (50 cents). This lay sermon is informed thruout with the spirit of idealism, and lends itself to quotation. "Learning," says Mr. Wilson, "is knowledge purged of all that is untested and ephemeral. It is neither the rumor of the street nor the talk of the shop nor the conjecture of the salon. It has been purified and sifted in quiet rooms to which passing fashions of thought do not penetrate. It has passed thru mind after mind like water thru the untainted depths of the earth, and springs to the places of its revelation, not a thing of the surface, but a thing from within where the sources of thought lie. Men come and go, but these things abide."

"And so the fountains of learning become the fountains of perpetual youth." Mr. Wilson himself is the exemplification of his principle that there is a stream of continuity in life and thought, for he expresses in the fashion of the twentieth century the religious faith and stern high seriousness of his forbears. He writes:

> Our true wisdom is in our ideals. Practical judgments shift from age to age, but principles abide; and more stable even than principles are the motives which simplify and ennoble life. That, I suppose, is why the image of Christ has grown, not less, but more distinct in the consciousness of the race since the tragic day in which He died upon the cross. . . . He is the only permanent person of history, the only being who was of no age because He was of all, the only complete and unalterable epitome of what man is and what man would be, a creature of two worlds.

Literary Notes

Dr. Robert Francis Scharff's *Distribution and Origin of Life in America* (pp. xvi, 497; $3) is issued by the Macmillan Company: a scholarly work well illustrated with charts.

Houghton Mifflin Company issues a new edition of the authoritative guide to *Auction of Today*, by Milton C. Work (pp. xxi, 289; $1.25). Another textbook in the same field is E. V. Shepard's *Scientific Auction Bridge*, published by Harper (pp. 241, $1).

Louis D. Brandeis contributes the introduction to Frank B. Gilbreth's *Primer of Scientific Management* (New York: D. Van Nostrand Company, $1): a condensed statement of principles formulated as questions and answers.

We recently announced that the publications of the Cambridge University Press had been taken over by the University of Chicago, but this is true only of a list of periodicals. Messrs. G. P. Putnam's Sons remain the American representatives of the Press, and have local control of the whole series of the Cambridge publications, aggregating some five thousand volumes.

Whether or not the public is tired of Mr. Phillpotts' Dartmoor there is no evidence that Mr. Phillpotts is tired of it. A New York newspaper has absurdly called him the Balzac of that province, and in one respect—longwindedness—he justifies the title in *The Forest on the Hill.* (Lane, $1.30.) High tho the novelist's reputation is as a prosateur, good as his yokel dialog is, one almost wonders if his style is not too labored. Is it that too much or too little labor goes into the evolution of his fine nature descriptions?

Eden Phillpotts is at least a most serious minded novelist: both in his imaginings and in his art. When all is said, he is one of the few Englishmen worth hearing out. In another recent novel, *The Lovers* (Rand, McNally, $1.35), he returns to the theme of an earlier story, *The American Prisoner.* Here at least is stirring romance, the scene being laid in the Dartmoor prison a hundred years ago. There is dash and fire to the adventure for freedom which makes *The Lovers* good reading.

Madame Judith, one of the clever Jewish actresses who made Paris sprightly under the Second Empire, and before, makes a diverting thing of the volume which she names *My Autobiography* (Putnam, $3.50.) How much that is due to her, how much to the "editor," M. Paul G'Sell, who "edited" Rodin's interesting conversations on *l'Art* (lately translated), is another question. The anecdotes of Rachel and other tragedy-queens, the accounts of Hugo, Musset, Sand, and other poets, furnish no small part of the light entertainment. The work of translation has been capably executed by Mrs. Arthur Bell.

Dr. Henry K. Carroll's *Religious Forces of the United States* appears in a new edition. The first edition was of much value, based on the Religious Census of 1890, of which he had charge. The present volume gives desirable information as to the history and standing of our religious denominations, including in the tables results of the Census of 1906, and further reports from denominational year-books. So far as the volume fails it will be in not incorporating the later results into the chapters which describe the several denominations, when we find tables not agreeing with the figures in the statistics of the Appendix. (Scribner, $2.)

The use of art museums in vitalizing instruction in history, literature, and other humanistic studies has been too little understood in theory, and almost wholly neglected in practice. The four lectures, now publisht, given in the Metropolitan Museum of Art last spring, on the relation of *Art Museums and Schools* (Scribner, $1), are well adapted to arouse more interest in this important subject. Teachers working in the vicinity of such great collections as those in the Metropolitan will find that they have extraordinary opportunities of enriching their instruction and encouraging higher artistic ideals if they but seek the leadership of such competent guides as these lecturers: G. Stanley Hall, Kenyon Cox, Stockton Axson, and Prof. Tonks.

Constantly increasing interest in folk songs justifies a collection of *Folk Songs of Eastern Europe,* publisht by the Oliver Ditson Company ($1.25). Wisely the piano arrangement of these songs is of the simple, unostentatious character suited to folk music. Less to be commended is the editor's scheme of substituting English verses—which he considers appropriate to the music—in place of original texts and translations. It is a dangerous prerogative: one would be sorry to see *'Way Down Upon the Suwanee River,* or *Comin' Thro' the Rye,* or *Sur le Pont d'Avignon* treated in that way. But the volume is valuable in opening the way to such inaccessible fields as Croatian, Herzegovinian, Lithuanian, and Finnish folk music.

In *Forty Songs,* by Tchaïkovsky, a welcome addition to the Musicians' Library has been made (Ditson: paper, $1.50; cloth, $2.50). One cannot help wondering, however, whether a somewhat thinner volume would not have meant a higher average of worth. In making a selection of songs from Schumann, Schubert or Franz, the problem is how to keep it within bounds; with Tchaïkovsky the difficulty is to find enough really great songs for a volume. At any rate, all the best ones are here. Their emotions range from the tragic intensity of Goethe's *Nur wer die Sehnsucht kennt* to the mellifluence of *Déception* and the airy grace of *The Cuckoo.* The publishers are to be thanked for finding English words which escape the too common inanity of song translations. The introduction, by James Huneker, is one of his penetrating studies of comparative music.

It is, very properly, the reference librarian of Princeton University, Mr. Harry Clemons, who compiles *An Essay Toward a Bibliography of the Published Writings and Addresses of Woodrow Wilson, 1875-1910* (50 cents). Space is left on alternate pages for notes and additions.

Miss Jimmy is one of "the desirable citizens." She is a paragon of physical endurance, fortitude, devotion, good humor and self-sacrifice. She is almost "too good to be true." But Laura E. Richards's book about her is a relief from the "problem novel," and crass realism. It is sane, sweet and wholesome (Dana, Estes & Co., $1).

We suggest to the teaching bodies of schools and colleges that are planning a course of study in sex hygiene and morals that they write to Reed College, Portland, Ore., for a copy of its syllabus of such a course. It is not only full, but it has the further merit of adopting the growing habit of using a measure of simplified spelling.

Irvin S. Cobb has drawn a portrait of Judge Priest in his collected stories, called *Back Home* (Doran, $1.25), which is loving and faithful to a vanishing type of Southern gentleman. Mr. Cobb's "Back Home" is in the State of Kentucky, and he tells the stories of his blue grass land with humor and genuine feeling for the human and homely characteristics of a passing generation.

Poor Dear Margaret Kirby is one of the eighteen short stories that go to make up a volume with the same name by Kathleen Norris (Macmillan, $1.30). The stories are all good, some of them of such merit as to warrant a more emphatic adjective. Indeed, we do not know what book of short stories we would feel like naming as better, if a friend asked for a book to help relieve the tedium of a journey.

A recent issue of *The Journal of Race Development* (Clark University, Worcester, Mass.; 50 cents) is chiefly devoted to China and contains a number of valuable papers. Ex-President Eliot writes on "The Means of Unifying China," Professor Hart on "The New Holy Alliance for China," and Dr. Wang on the relations with the United States. Major Seaman pleads for the recognition of the Chinese Republic.

Pierre Loti has written a book entitled Agonizing Turkey—*la Turquie agonisante* (Paris: Calmann-Lévy)—and the literary editor of the *Temps* recalls the fact that the writer has defended the conquered in other wars: Spaniards and Boers alike. Also Loti declared, long ago, that he has a Turkish soul (or is it an Arab soul?) and one may also see in his defense of the Mussulman a tender recollection of his fondness for Aziyadé. Moreover, he has especially loved Constantinople as an exotic capital offering a change of scene without too long a voyage out of his own Occident. Just as one of his literary forbears loved a *solitude à deux*, so has Loti loved an East accessible by the Oriental express—without changing cars.

This author, who has praised Turkey as "the last refuge of calm, respect, sobriety, silence, and prayer," and Stamboul as "a sacred domain of history, art, and poesy," has also sung the praises of one of the Balkan states, or, rather, its ruler; the Queen of Rumania. The Macmillan Company publishes this paen in honor of *Carmen Sylva* in a volume which includes several other sketches: impressions of Snake Charmers, Japanese Women, Constantinople in 1890, etc. (Pp. 214, $1.) Mr. Fred Rothwell has done the translation, and done it tolerably.

Patriots is one of the plays of the Abbey Theater, Dublin, being the work of the stage manager, Mr. Lennox Robinson. This piece, a tragi-comedy in three acts, had its first performance in New York on the evening of February 11, and has been publisht in Boston by John W. Luce & Co. (75 cents.) The theme is the return of an Irish revolutionist from prison, after eighteen years' incarceration, and his failure to fit into the new Ireland, which he finds concerned with problems of material prosperity; the study of Gaelic and indulgence in many meetings and lectures being its only reminders of the old national spirit to which he has sacrificed his all. The scene is an Irish country town, and the dramatist succeeds in providing his players with a number of portraits to vivify, and a plenty of humor and satire and pathos.

Another Irish play comes to us from the same publisher and is listed at the same price: *The Drone*, by Rutherford Mayne. This is, we believe, a North of Ireland product; its scene being County Down, and not Synge's wet West Coast. The play was acted in New York not long ago by another company than that of Dublin's Abbey Theater. The central figure here is a lazy and rather sympathetic incompetent, who for a good many years has posed as an inventive genius and thereby escaped doing his share of the world's work. There is less action than some of us would exact of acting plays, but the characterization is equal to that of the minor plays that have come out of the Green Island.

Pebbles

"Mrs. —— celebrated her one hundredth birthday yesterday. She was visited by her twin sister, age ninety-five."—*South Wales Echo.*

The absence of the third member of the triplet, an old lady of eighty-two, was much regretted.—*Punch.*

"Here's where I deliver the goods," remarked the skipper as he unloaded a cargo of missionaries on the coast of Africa.—*Columbia Jester.*

"I'll make a clean breast of this whole fowl affair," muttered the chef as he scraped the last vestiges from off the diaphragm of yesterday noon's roast duck.—*Gargoyle.*

At the International Art Show

THE MATISSES.

Each one of them reveals a master's hand.
What technique! And what color! And—
And? And?

PICABIA'S "PROCESSION, SEVILLE."

Of fair Seville's towers
I gained a faint impression,
But still am several hours
In rear of that "procession."

BUST OF MLLE. POGANY, BY BRANCUSI.

Art is itself embodied in each curve!
The sculptor chisels life down to its core.
We know he's found the germ, for we observe
That it is but an egg and nothing more.

"NUDE LADY DESCENDING STAIRCASE."

O lady fair,
As down the stair
You trip, your air
Enthralls me being!
Ah, could you wiss
The sense of mys-
Tery, the bliss
With which I'm seeing!

The face unguessed,
The form repressed,
And all the rest
Unseen, I'm chanting.
Each curlicue
And whirl of you,
Each splotch and hue
But leaves me panting.

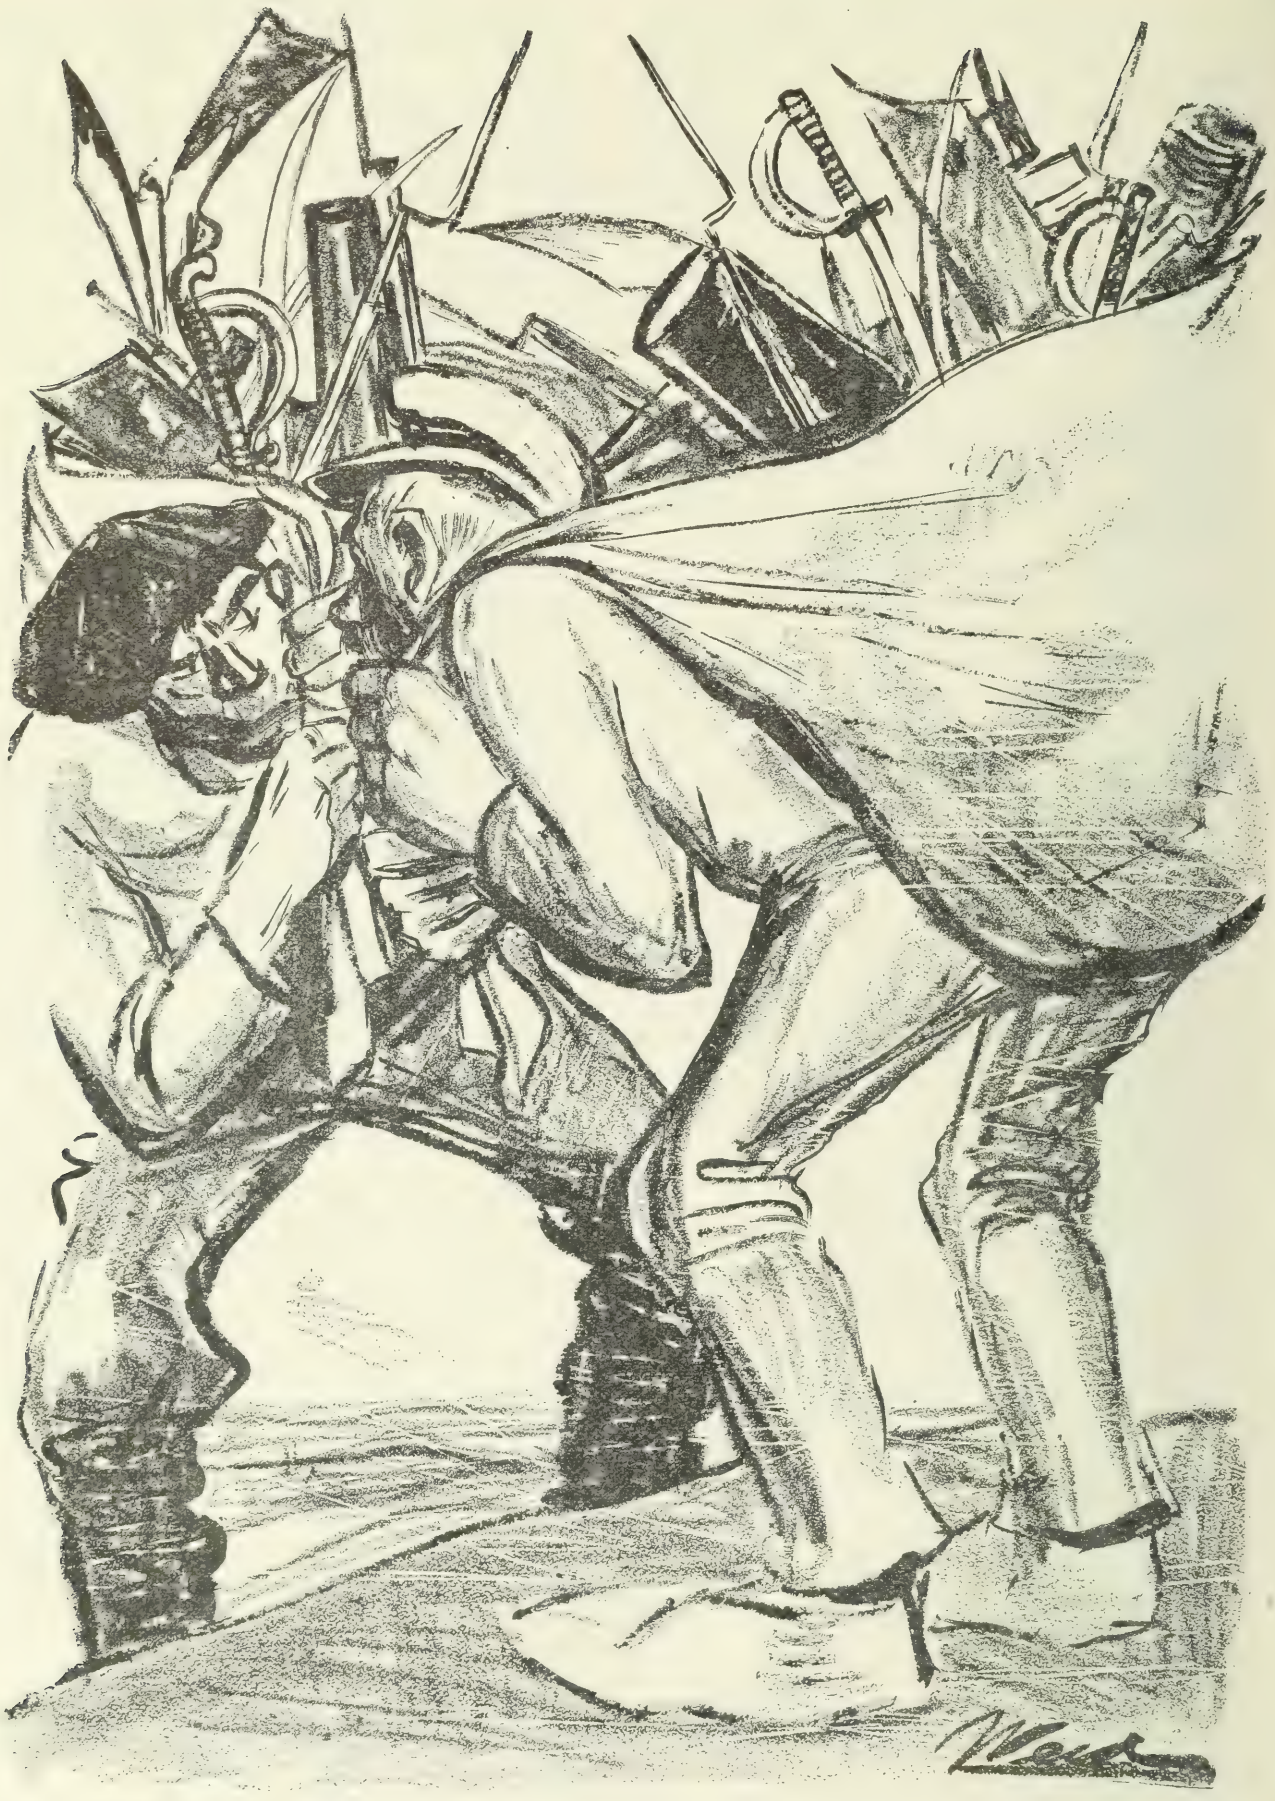
A tear unbid
From 'neath each lid
Has downward slid.
Ah, depth of woe! You
Upon the street
Suppose I meet;
I cannot greet
You. I won't know you!

—Maurice Morris in New York *Sun.*

Fifty Years Ago

From **The Independent,** March 26, 1863

THE WAR



In General.—Preparations advance rapidly everywhere, and against Port Hudson and Vicksburg troops and fleets advance slowly. The rebels are certainly experiencing the great distress in consequence of the war, the navy continues to catch prizes, and there is a perceptible lack of hope in the tone of rebel newspapers. Reports also reach Washington of purchases by leading rebels of exchange on Europe and of Northern funds, as if they were getting ready to desert a sinking ship. And it is also variously indicated that it is not beyond their expectations to be driven out of Richmond; which would surely destroy the *morale* and confidence of the whole rebel rank and file, both civil and military. From day to day, and almost from hour to hour, the most important news may reach us.

The Advance on Vicksburg and Port Hudson.—On March 16, the water seems to have been let into Lake Providence, and it now remains to be seen whether this cut will admit our fleets, as has been hoped. If it does, it affords an easy road to pass Vicksburg, cut off the rebel supplies *via* Red River, and get into the rear of Port Hudson.

But even if the Lake Providence cut fails, the report is apparently quite to be believed that Admiral Farragut with his whole fleet has passed the Port Hudson batteries on the night of March 14, losing only the frigate Mississippi, which ran aground and had to be burned. This maneuver places our fleet in a much better attitude to cooperate with Gen. Banks, and at the same time cuts off the Red River rebel supply road with a gate too strong to be forced open. This gives one more twist to the rope round the throat of the rebellion. General Banks is operating against Port Hudson by land, and was reported at the date of Farragut's passage within five miles of the rebel works.

The Conscription.—Preliminaries toward operations under the conscription law have been commenced. Col. J. B. Fry, formerly on Rosecrans' staff, and since Assistant Adjutant General of the U. S. Army, has been appointed Provost-Marshal-General of the United States under the act.

It is said that Copperheads in various parts of the country are organizing and arming to resist the act, and so apparent have such operations become in Ohio and Indiana, that the military authority at Cincinnati and Indianapolis has forbidden the sale of arms except under precautionary regulations.

THE FRENCH AND THE GERMAN PEASANT (chorus):—Let's chuck the bundle!"

SURVEY of the WORLD

Vitality of Stored Seeds

The old stories of seeds from which plants have been grown after hundreds of years of storage are now generally discredited. It used to be asserted that a variety of wheat, known as mummy wheat, began in a few stalks raised from seed found in the hand of an Egyptian mummy. Something of the sort seems to have been done, but there is much doubt whether the original grains were as old as the hand that held them, for the rascally Arabs along the Nile are not above trickery. Whatever may have been the truth, the announced results of experiments long conducted by the Royal Agricultural Society of Great Britain show that there has been error somewhere in the legends.

It was proposed to test, thru as long a period as the matter required, the length of time in which carefully protected seeds of grains and fodder plants would preserve their power of germination when offered favorable conditions. Samples of forty-three kinds of farm seeds were procured in 1895, and have been since stored in paper bags kept in close, dry cabinet drawers. Tests indicated that the germinating power of barley and wheat was little affected during the first five years, but decreased rapidly until the tenth year, when no live seeds remained. Five years later white oats showed no life, but black oats germinated for fifteen years, owing, it is thought, to the adherence of the glumes. In the case of grasses, all the samples died between the eighth and thirteenth years. The various kinds differed somewhat, timothy proving strongest on the whole; but grass seeds showed great individual difference, some samples of each kind losing germinating power long before the others, altho apparently just as perfect and vigorous. The clovers showed a slight loss of vitality during the first three or four years, a rapid loss for about four years more, and finally the gradual loss of the last 10 per cent during the following three or four years. The hardiest seeds of alfalfa lasted nearly fourteen years. Of the vegetables, most kinds lost vitality rapidly, and none of their seeds responded to cultivation after the eleventh year.

One rather curious bit of by-knowledge was learned during the course of the experiments, namely, the "living embryos transferred to the food-store of dead seeds utilize it freely, and that the store of food retains all its properties for years after the seed is dead."

Insurance Against Unemployment in England

Judging by the English newspapers there has been a remarkable change of sentiment among British working people since January 15, when the Insurance Act of 1911 came into full working. On July 13, 1912, the weekly payments under the law became compulsory, and for six months about 14,000,000 men and women were called upon each week for their contributions, while as yet no benefits were available. By January 15, a sufficient fund had been accumulated, and both sick and unemployment benefits began to be paid out to the insured workers. During the six months of all outgo and no income, the Conservatives had made much political capital out of the discontent of many of the working people with the act. It is now acknowledged even by the Conservative newspapers that no popularity can be gained from attacks on the principle of national insurance, and little is likely to be heard of the unpopularity of the Lloyd George Insurance Act. The unemployment section of the act is admittedly experimental. It covers only a few selected trades—shipbuilding, building and construction trades, engineering, iron-founding, and the construction of vehicles. These trades employ about two and a quarter million people, of whom only 10,000 are women and about 100,000 boys under eighteen. When the figures for February were available, about 2.2 per cent of these insured workers were in receipt of unemployment benefits—a smaller percentage than were unemployed in the same trades in February, 1912. The contributions to unemployment insurance in the trades that come under its operation are 5 cents each from the employer and workman, to which the Government adds 3 1-3 cents, making 13 1-3 cents per week as payment into the fund. The benefit during unemployment averages $1.70 a week

up to a maximum of fifteen weeks in any one year. The payment seems small for the head of a family, but it is expected that the certainty of receiving even this much will be an incentive to further thrift, and will certainly be no temptation to unenforced idleness.

The Harvard Idea in Politics

There are Harvards and Harvards. There is the big Harvard up Boston-way and a little Harvard out on the Nebraska prairies. The Nebraska namesake has evolved the biggest idea that appeared in the politics of the recent Presidential campaign. The ambitious little city of the West has devised a way to lessen campaign expenses, and to elevate political campaigning to a plane of decency, intelligent discussion and effective consideration by the community of current political issues.

Harvard, Neb., population 1200, 200 miles west of Omaha, has two railroads and the usual appurtenances of a small prairie trading center. Like thousands of railroad towns, Harvard just grew up, Topsy-like, with no thought or concern about community looks, community obligations or community opportunities. Without great riches and without poverty, the Nebraska Harvard, like its New England namesake, was satisfied with itself. But now it has decided, while existing as a trade center, to get acquainted with itself as a community; to ask itself what community duty commands. Too small to break up into the congenial groups of a big city, a village must either fall out and fight, or fall in and pull together. Harvard has tried both social programs. Many small towns have commercial clubs. The trouble with commercial clubs is the name and the membership. The social vision of business men is very prone to be limited and blurred by the dollar sign. The death rate of clubs so limited is and ought to be very high. After a due season of mourning for the death of the Harvard Commercial Club, the Harvard Community Club was formed, with a community basis of membership and a program broadened to a humanitarian vision. The membership consists of merchants, professional men, and, in fact, of all men with a social conscience and a will and willingness to do team work. Neighboring farmers are members, because progress in transportation and transmission of intelligence has made corporation limits meaningless. The new community unit made possible by telephones, rural delivery, good roads and autos knows no town boundaries. The community unit today is more nearly a county with a trading, educational and religious center. This county community is composed of all who trade, educate or worship at such a center. This is the strongest argument for county option and county community control.

The recent Presidential campaign gave the new Harvard Community Club a chance to show its mettle and to demonstrate its mission and right to be. The club decided that the community ought to hear the big issues of the hour discussed by the big men of the three big parties. This determined them to hold a tri-partisan community political revival. A large tent was secured, seated camp meeting style, provided with platform and piano, and patriotically decorated. Community talent was asked to furnish appropriate music. The community's advertising spaces were covered with quarter-sheet bills, printed in brilliant colors, announcing a tri-partisan political revival.

The revival was held during the afternoons and evenings of October 1 and 2. The tent was crowded. The community enthusiasm rose to the highest pitch. In the two days eleven political addresses were given. Among the speakers were the candidates for Governor, for the United States Senate and for Congress. The whole community was there three hours of afternoons and three of nights. It was not a joint debate, but a joint presentation by men of State and national reputation of the State and national political issues. The community, sitting as a jury, heard the arguments of the attorneys. The audience, made up of voters, of women who fully expect to vote soon and are fully qualified to vote now, and of the young folks, listened, laughed, cheered and poked one another over especially good hits. After eleven hours' argument, the community as a jury retired, and returned a sealed verdict on November 5th. There was no more campaigning in that community, no one-sided partisan rallies. The Community Club bore all local expenses. Candidates and speakers had only their hotel and traveling expenses to bear.

The Harvard Community Club, having demonstrated its ability to do big things in a big way, has gone about doing bigger and better things. Plans have been prepared to build a community club house to provide rest rooms for women and children; to be, in fact, the community's front parlor and retiring room. When a community discovers that its reason to exist is not only to make money, but to live, there is hope that humanity's vested rights will be respected and developed. The Harvard Community Club is a delightful oasis in the American political and social desert—a vivifying example of community gumption.—GEORGE L. MCNUTT.

Dogs in the Hospital Corps

The Red Cross dog bids fair to be a conspicuous feature of the battlefield of the future—in so far as the future is disgraced by battlefields. His new duty makes of him a second cousin of the police dog, and it is likely that he will, in most cases, be something like the police dog in size and in breed, since his work demands of him an inconspicuous color, medium size and plenty of reserve force. But what are to be his duties?

To sum it all up in a word, he is to be a canine Good Samaritan. He is to seek out the wounded on the field of conflict, carrying them nourishment and bandages. Having found an unfortunate, and, in cases where the soldier is able to help himself to supplies, supplied him with relief, the dog will return to his chief and lead him to the wounded combatant. Having been used for time immemorial by sporting men as an engine of destruction, this natural friend of our race is at length granted an opportunity to express those gentler sides of his character that have marked his service of the monks of the Alpine missions. And the Red Cross dog is by no means a creature of the remote future; already, we read, the German army is equipped with some two thousand of him.

Agricultural Proselytes

Among the recent interesting attempts to extend the knowledge of agriculture to new classes of the population are the experiments of foreign governments in the agricultural instruction of soldiers, and the work of our own country in the organization of boys' and girls' agricultural clubs. Germany began the teaching of agriculture in the garrisons four years ago. It is too soon to look for practical results, but during these four years an agricultural course has been conducted in nearly every garrison in the empire. It is usually held in the winter months and for one or two hours a week. In France and Italy also the soldiers are instructed in agriculture. Rumania, by way of encouraging agricultural knowledge, reduces to one year the military service of all who have graduated from elementary agricultural schools.

From figures now available concerning the boys' and girls' agricultural clubs in this country, it appears that in the year just closed there were 90,000 boys engaged in club work, under the auspices of the Department of Agriculture, for the raising of corn, Kaffir corn, and cotton. Besides these there were in the northern States some 40,000 engaged in club work or in agricultural contests. Competition led to large yields per acre. In the South several of the boys in the corn clubs secured yields of 200 bushels per acre. The girls' corning and poultry clubs in twelve southern States had over 23,000 members. Each member of the canning clubs kept a careful account of expenses and outlay. Each had to cultivate one-tenth of an acre of tomatoes and report her net profits. The lowest average net profit for one-tenth of an acre was $14.57 and the highest $40. Here again the keen competition led to some remarkable yields. One girl is reported to have raised on her plot 5928 pounds of tomatoes.

Hydrogen for Food

The importance of hydrogen gas as an indispensable factor in modern military aeronautics and such technical operations as autogenous welding and soldering, cutting metals into shape for construction work, steel plates, beams, girders, etc., is generally well known. The trade in comprest hydrogen has expanded wonderfully in the United States as well as in Europe; in the case of a leading German house from 34,000 cubic feet in 1899 to 32,000,000 cubic feet in 1911. Vast sums of money appropriated for military ballooning have gone into hydrogen factories and relay stations in Germany, France, Russia, Austria, etc.

But a more surprising utilization of hydrogen has sprung into existence from the work of this year's winner of the Nobel Prize, Professor Sabatier, of Toulouse, France, who, in conjunction with Professor Senderens, established "hydrogenation" as a practical and commercial process. Hydrogenation, or chemical introduction of hydrogen into organic compounds, may mean either that the hydrogen is taken up and retained as an additional constituent of the compound, or the hydrogen supplants some of the oxygen of the compound. In the latter case, the oxygen is ousted in the form of water, resulting from its union with a portion of the hydrogen. Sabatier and Senderens have found that it is possible to induce organic compounds to take up this extra hydrogen by presenting it to them in a novel and more attractive form. It had long been known that certain metals, such as copper, nickel, iron, platinum and palladium, readily dissolve hydrogen under certain conditions of temperature and pressure. One volume of nickel will, at 300° C., absorb about 50.5 volumes of the gas. Palladium was found by Graham to absorb nearly 1000 times its own volume, and thereby increase in bulk by about 10 per cent.

The metals thus charged with hydrogen retain their characteristic metallic appearance, but readily evolve part of the absorbed

gas when circumstances are changed. The two French chemists found that a union with organic bodies could be readily effected, if the hydrogen was made available in this dissolved form. Their process of hydrogenation consists in letting hydrogen gas act on the organic bodies, in presence of finely divided, powdered metals, which first absorb the hydrogen and then transfer it to the body to be hydrogenated. These metallic hydrogen carriers are not in any manner changed or used up, and a small quantity of nickel or palladium will effect the hydrogenation of large amounts of material.

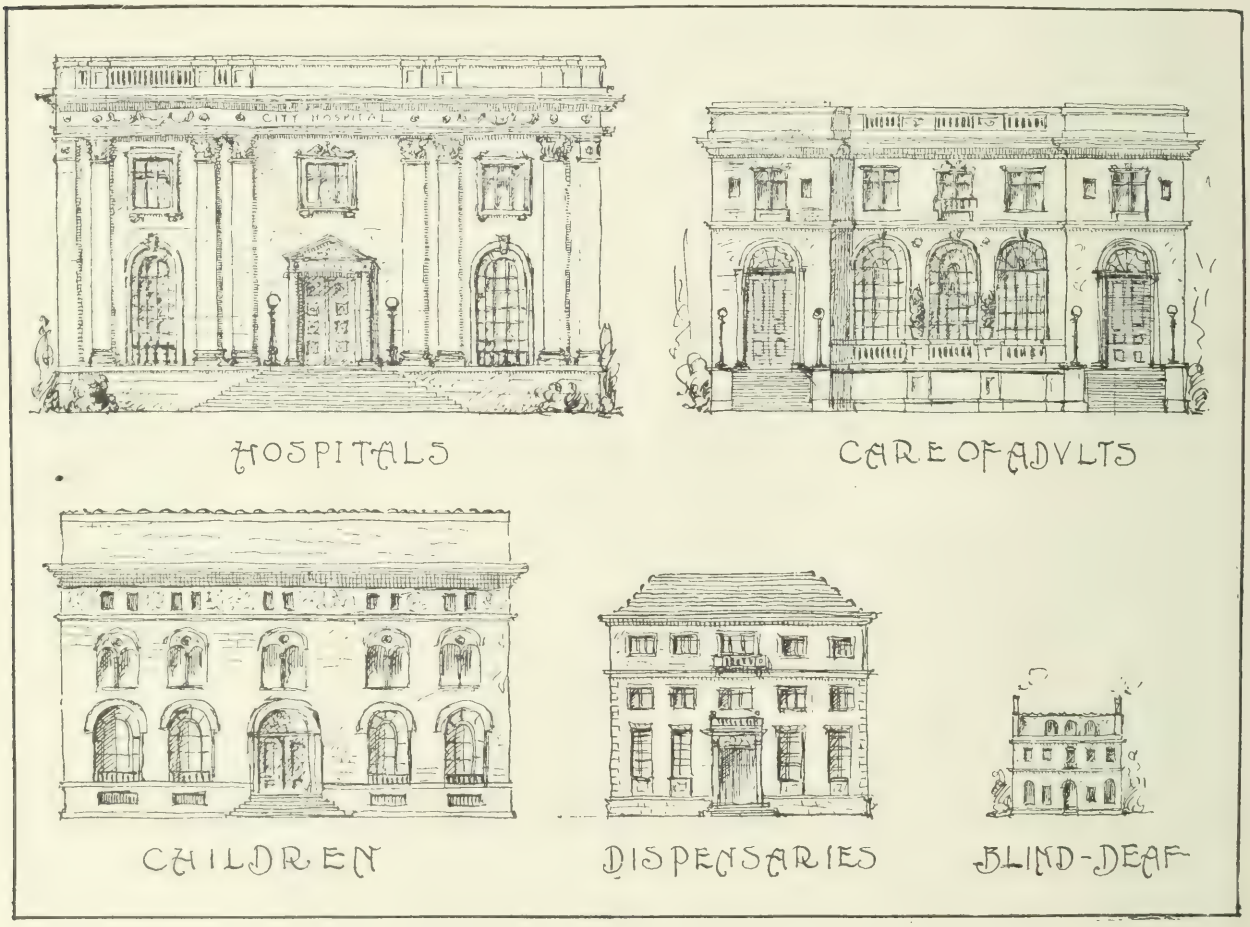
This process is already revolutionizing the industries of fats, soaps and candles, since it affords a ready means for converting cheap oils into more valuable solid fats. Tallow, indispensable for making hard soaps and candles, may thus be supplanted by cottonseed oil and fish oil.

When a heated mixture of cottonseed oil with 1 per cent nickel is treated with hydrogen gas for several hours, a white, lard-like mass is obtained, which as "Crisco" has become popular for cooking and frying.

By carrying hydrogenation to its farthest limit the cotton oil material attains the hardness of the stearin as used in candle making. None of the nickel or other metal enters into the finished product. The chemist would state the process to be, converting unsaturated fats (oleic acid) into saturated ones (stearic acid)

$$\underset{\text{Oleic acid}}{C_{18}H_{34}O_2} + 2\,H = \underset{\text{Stearic acid}}{C_{18}H_{36}O_2}$$

The increase in weight only amounts to about half of 1 per cent on the cottonseed oil.



That certain bad smelling constituents are liable to be entirely changed in nature and constitution by hydrogen, has become a factor of vast importance, for odoriferous fish oils may now be converted into palatable and wholesome foods.

The importance of the discovery will be realized when we remember that our annual production of tallow exceeds 400,000 tons; of butter, 1,000,000 tons; of cottonseed oil, 700,000 tons; and our national fat trade amounts to $800,000,000.

Benevolent Institutions

A special report on benevolent institutions in the United States is in course of preparation by the Bureau of the Census, but certain preliminary figures have been already issued showing the number of institutions reported, together with certain data relating to the inmates of these institutions.

The total number of institutions reported

RELATIVE SERVICE OF OUR BENEVOLENT INSTITUTIONS

in 1910 was 5,397. These are classified as follows:

Institutions for the care and protection of children	1,361
Institutions for the care of adults or adults and children	1,442
Institutions for the education and care of the blind and deaf	110
Hospitals	1,896
Dispensaries	576

There were, either in these institutions or under their care at the close of the year, 380,337 persons. Of these 107,401 were in children's institutions and 35,279 were in societies for the protection and care of children. Institutions for adults or adults and children had 121,876 inmates. In the institutions for the blind and deaf there were 651 inmates and in hospitals 28,869.

The extent to which the hospitals and dispensaries are now being utilized is shown by the fact that nearly 2,000,000 patients were treated in the hospitals and nearly 2,500,000 in the dispensaries during 1910. The number treated in the hospitals shows an increase of more than 900,000 over the number treated in 1904, and in dispensaries an increase of more than 825,000 over 1904.

During the year 82,011 children were received into institutions and 37,825 were turned over to families or institutions for care. It is interesting to note that most of them were placed in families where they could have the benefit of home life rather than institutional treatment. The rapid increase in the number of institutions in this country does not imply a corresponding increase in the number of those who require institutional treatment, but rather an increase in the proper provision for them at the hands of the public. It was not so very many years ago when children, the insane, the feeble minded, the epileptic, were all cared for in town or country almshouses. Now the State is building and equipping institutions for the care of special classes of dependents and defectives. Statistics are not yet available to show the amount of money invested in these institutions nor the annual expenditure for their maintenance. If the future of the race in this country is to be safeguarded we must make adequate provision for the permanent segregation of the mentally and physically defective.

WILLIAM B. BAILEY.

Liverpool's Great Docks

Liverpool has wisely kept pace in its dock improvements with the increasing size of the vessels it has to accommodate, and in this respect it offers a marked contrast to New York, which is now suddenly confronted with the problem of accommodating at its piers the 1000 foot ships. Liverpool will open next July the greatest of all its docks, the Gladstone, 1020 feet long, or nearly 140 feet longer than its present biggest dock, the Olympic. The structure of the Gladstone dock is such that it can be used when required as a graving dock for overhauling and repairing the largest steamers afloat. Liverpool also had the honor of building the first dock in England, which was opened in 1715, almost two centuries ago. Next followed what was called the Salthouse dock, and in 1761 a third dock was authorized. In the half century following more and greater docks were built, until by the middle of the nineteenth century Liverpool had outstript London as a port. It is today the greatest port in Great Britain as to exports, tho London leads in imports. The total trade of Liverpool is only slightly less than that of London, the value of its imports and exports in 1911 being, in round numbers, $1,682,000,000, as against London's total, $1,941,000,000. Her docks have a total area of 416 acres, with a gravage of 26 miles, and an additional area of 10 acres in the three Liverpool basins. Including Birkenhead, the total tonnage of ships arriving at and departing from Liverpool for the year 1911 was 29,175,986 tons.

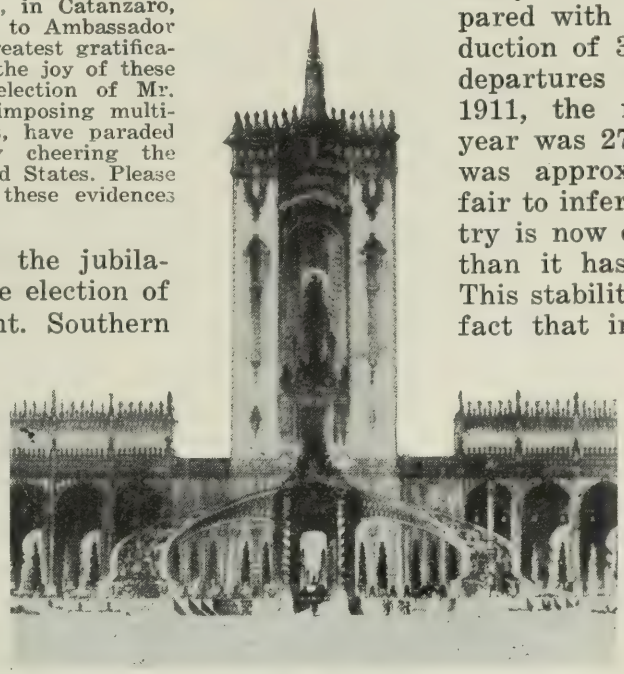
Waste of Life by Earthquakes

It is reported that Reggio, the city on the mainland shore opposite Messina, Sicily, has been again shaken by a destructive earthquake. This has happened many times before, and the town has been several times rebuilt, as have other towns in that region. The western coast of Italy, from Ischia and Naples around to the extremity of Sicily, is a line of weakness in the earth's crust, where volcanoes give vent to melted and crushed matter far down beneath the surface, and by doing so cause a slipping among the loosened strata. This goes on almost incessantly, and every few years so jars the overlying rocks as to upset human erections on the surface. This will continue, and so will the destruction of life and property, so long as men continue to fabricate houses, churches, harbor works, etc., in disregard of natural conditions. The Italian Government took a great responsibility when it permitted Casamicciola and similar towns to be rebuilt in the same old fashion after such destruction as overtook the Ischian watering place in 1883, or Messina more lately. The statistics of the destruction of life by earthquakes compiled by the celebrated seismologist, Professor Milne, and mentioning only the most notable instances, are appalling. In India in 893, 180,000 persons were killed by a single shock, four-fifths of them in a single city. Japan

lost 200,000 at one time in 1703, and Pekin 100,000 in 1731, and India again 300,000 in 1737. In 1169, 15,000 were killed at Messina; in 1693, 75,000, and in 1908, probably 100,000. But these terrific losses were due in some cases to density of population, or to special circumstances, such as that the shocks happened at night when people were asleep and had not time to get out of doors. One great fatality occurred at Caracas by reason of the fact that masses of the townsfolk were crowded in a church at a religious feast, and were crushed by its falling roof and arches.

This indicates the real explanation of the destructiveness of earth-movements, at least as relates to the unstable border of the Mediterranean. A very small percentage of persons are killed by the movement or cracking of the ground, or by seismic ocean waves (as has happened frequently in Japan and China), but by the falling of buildings. The Italian coast cities and villages, and those of the Riviera, are usually clustered densely along very narrow streets, and in most cases in tiers upon hill slopes or even cliffs. The houses are made of stone or brick, sometimes even of pebbles, are often tall, requiring thick walls, yet the masonry is poor and the mortar as a rule far too weak. Their roofs are usually tiles, held in place mostly by their own weight, and the floors are very heavy and insecurely tied to the walls. A jar which would only rock the shepherd's cabin on the suburban hills will tumble such a town in shattered ruin, and there is no escape for the citizens in the lane-like streets into which the buildings topple. That this style of house and town building in an earthquake "belt" is suicidal is shown by percentages of deaths to population in contrasted places. Thus in San Francisco and Charleston, to cite modern instances, the death rate was less than 1 per cent, while in the Italian earthquakes of the last two centuries, as tabulated by Milne, it was from 50 to 80 per cent. Japan is constantly jarred by seismic disturbances, sometimes very severely, and her scientific men have paid great attention to the matter, and have evolved certain rules for housebuilding which are now followed, reducing to a minimum the danger of the house tumbling upon its inmates. Japanese buildings generally, however, are well calculated, by their structure of wood, and low broad plan, to withstand destruction, even in cities, and it was due to this intelligent architecture that in 1891, when in Japan a shock four times as strong as that which wrecked Messina in 1908 was felt over an area ten times as great, only 7,273 persons were killed as compared with 100,000 in Messina. Until the Mediterranean people learn and consent to build their homes and warehouses with reference to this danger, they must expect to endure fearful catastrophes.

The Immigrant Barometer in 1912



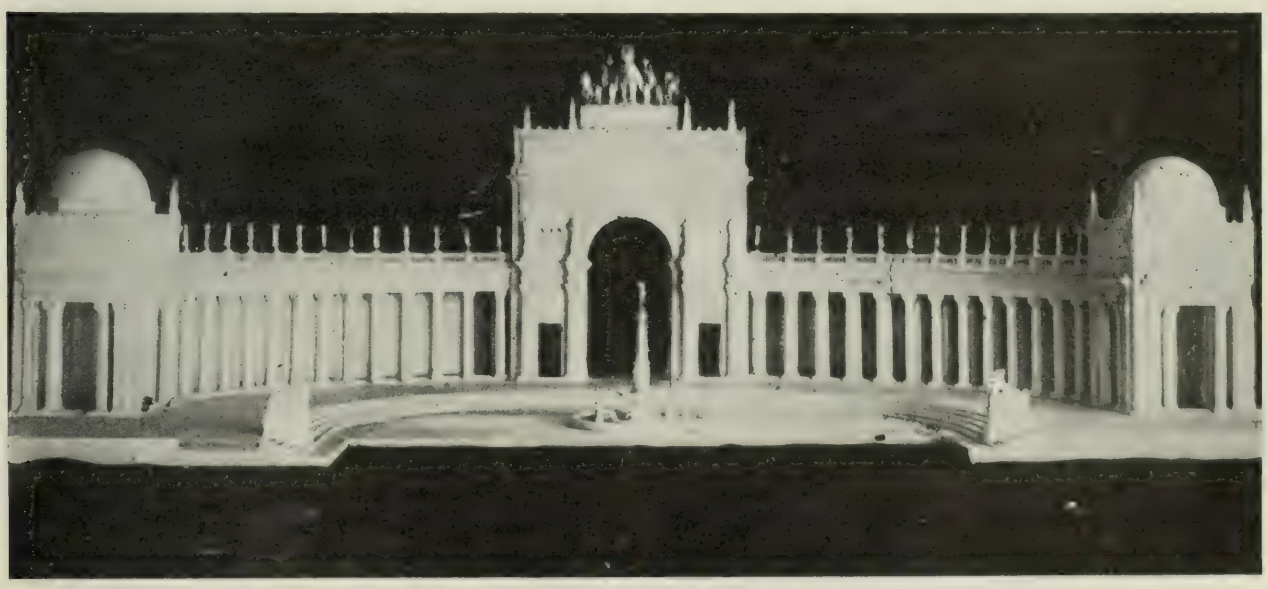
Students of immigration recognize in the movement of American immigration one of the most reliable of indexes of industrial activity in this country. Our immigration is chiefly of the unskilled labor class, the class to which we have adapted a large proportion of our industrial mechanism. It is the first to be released from employment when times are dull, and when they are good its services are in marked demand. Without this labor there would be great difficulty in providing the public utilities required by an expanding commerce and erecting the additional plants needed for the housing of industry. The ebb and flow of immigration has been found to respond with great delicacy to the law of supply and demand, unemployed immigrants taking themselves back to their native countries when their services are not in request, and returning upon the hint of a neighbor already here that the demand has appeared again. Viewed from this angle, the immigration movement of the last year is of special interest. For the first time in a Presidential year more than a million immigrants landed on the American shore from Europe.

It has been noted that in recent Presidential years the immigration has fallen below that of the years preceding and succeeding. This has been credited to the general feeling of industry that the year of a political campaign is a good one in which to modify its activity, to undertake fewer enterprises. Thus, for instance, the total westbound travel in the third, or immigrant, class for the calendar year of 1904 was 696,740, as compared with 806,947 in 1903 and 920,771 in 1905. There is a marked difference in the numbers returning home for the same years, the total for 1904 being 359,992, as compared with 245,527 the previous year and 232,432 the succeeding year. In 1908, the year of President Taft's election, the outgoing total was 620,963, nearly double the incoming total. The large outward flow in 1907 and 1908 was in great part due to the sudden stoppage of the wheels of industry in October, 1907. This event, coupled with the Presidential election of 1908, was chiefly responsible for the falling off in immigration in 1908. The interest which prospective immigrants take

in our elections, or have taken in the past, is indicated in this dispatch which was sent from Rome on November 9, 1908:

There have been a number of demonstrations of rejoicing in the southern provinces of Italy over the election of Mr. Taft. The mayor of St. Andrea Apostolio del Jopio, in Catanzaro, sent the following telegram to Ambassador Griscom: "It is with the greatest gratification that I express to you the joy of these laboring people over the election of Mr. Taft. Our inhabitants, in imposing multitude and preceded by flags, have paraded the streets enthusiastically cheering the new President of the United States. Please communicate to Mr. Taft these evidences of esteem and devotion.

The marchings and the jubilations were due to the election of a Republican President. Southern Italians, until now, have generally thought that prosperity and a Republican victory went hand in hand. If one may judge from the immigration figures for 1912, the prospective immigrant either now lays less stress upon the effect of politics on industry, or industry is on such a firm footing that employment is certain, regardless of political conditions. The total immigration last year was approximately 270,000 greater than in 1911. Moreover, and this is a notable detail, half of the immigrants landed after July 1, and consequently following the date when the names of the candidates of the chief parties became known.



A NOVEL CASCADE

The arrangement of this great waterfall on the lines of a staircase and the two great fountains will be one of the sources of visitors' amazement at the 1915 exposition. The court shown here follows the style of the Spanish Renaissance. There will be enacted mammoth pageants. The great tower, 270 feet high, will contain a pipe organ, with echo organs in the smaller towers. From a photograph copyrighted by the Panama-Pacific International Exposition.

It is of interest, also, to note the movement toward Europe. In 1911, 504,000 sailed away in the third class, as compared with 466,300 in 1912, a reduction of 38,200. Subtracting the departures from the arrivals in 1911, the net immigration that year was 270,000. In 1912 the net was approximately 90,000. It is fair to infer, therefore, that industry is now on a more stable basis than it has been in some years. This stability is emphasized by the fact that industry is able to attract supplies of labor in a year when the political conditions were particularly unfavorable to a large movement of immigrants. Such a westbound flow as that of last year has been exceeded only twice in a calendar year and never in a Presidential year.

If any other evidence of a shortage of unskilled labor were required, it is furnished by the fact that contractors, in some cases last summer, were so short handed that they were obliged to offer $1.90 and $2 a day for Italians. Not infrequently they

THE PANAMA-PACIFIC COURT OF HONOR

A section of the court, which will open on San Francisco Harbor, and measures 750x900 feet. The triumphal arch will lead into the East, or Festive Court. Sunken gardens and mural paintings, designed by Jules Guérin, are features of the plan.

sent skirmishers around to the labor camps to attract men from their jobs.

HERBERT FRANCIS SHERWOOD.

And Yet More Taxes!

The proposal to raise a special war-purse of $250,000,000 in Germany by a general property tax lends significance to an article contributed by the Parisian economist, Raphaël-Georges Levy, to the *Revue des Deux Mondes*. One of his statistical tables shows how large are the resources as yet untapped by the War-Lord. The sums are francs and centimes, and are calculated per head of population:

	FRANCE. f. c.	GERMANY. f. c.
Alcohol pays	10 0	3 10
Beer pays	0 40	2 35
Wine pays	1 0	0 20
Tobacco pays	13 0	0 75
Sugar pays	4 0	2 90
Salt pays	0 25	1 00
Matches pay	1 05	1 10
Customs duties pay	14 50	12 15
Traffic tax pays	2 10	0 40
Death duties pay	8 0	0 75

These figures are the more suggestive since they are issued from the French side of the Rhine, and by no militarist. M. Levy points out that if Germany were to raise her death duties and her taxes on tobacco and alcohol to the same scale as those of France, she could thereby easily guarantee an emergency loan of several milliards of marks. Alcohol taxed at the French rate would produce in Germany a revenue of $90,000,000 a year, death duties about the same, the traffic tax more than $20,000,000, customs $30,400,000, sugar $14,000,000, and tobacco $150,000,000. Examination of the incidence of various taxes upon real and personal property in France shows that even under existing conditions most kinds of property pay far more to the State than the 4 or 5 per cent levied upon income in Prussia.

Roosevelt's African Expedition

The Smithsonian Institution has now given the names of twenty-eight men whose subscriptions it obtained for its expedition to Africa conducted by Mr. Roosevelt four years ago. By these subscriptions the Smithsonian financed three-fifths of the expense, while two-fifths were paid by Mr. Roosevelt. This, says the report, covered all his personal expenses and those of his son, and their proportionate two-fifths share of the total expenses of the expedition. The collections received were distributed in the various departments of the Institution. Of the large mammals groups have been mounted and are soon to be on exhibition, while most of the specimens have been placed in the study series or are assigned to exchanges. Of mammals there are 5013 specimens, birds, 4453; birds' eggs and nests, 331; reptiles and batrachians, 2322; fish, 447; sheets of plants, 5153; insects, 3500; shells, 1500; and of miscellaneous invertebrates, 650. As a result of the expedition the biological collections now in the National Museum from East Africa are probably the most complete and systematic of any in the world.

Parisian Improvements

For thirty years Paris has been agitating the question of razing its old fortifications, and transforming them into parks and boulevards. The Paris Municipal Council last spring reported in favor of the plan, and now, by a vote of 67 to 8, has decided to acquire from the Government this circle of fortifications and the adjacent military zone. The price to be paid to the Government is said to be $20,000,000, and the cost of razing the fortifications, laying out new parks and boulevards and the construction of an ornamental railing encircling the city, will bring the total cost close to $50,000,000. The city, however, will sell a portion of this land for buildings of a certain character, so that the total expense is expected to be about the sum to be paid the Government.

The scheme is a large one and will mean almost as much to the city as the great improvements under the Empire by Baron Haussmann. This scheme is merely a part of the extensive plans formulated within the past few years for the beautification of Paris, for which a loan has been placed of $180,000,000. Some of the other plans now brought to completion, or in the process of realization, are the abolition of antiquated and noisy street cars driven by comprest air, and the substitution of electric cars in their place; the improvement of subway or underground railways; the addition to the water supply, and the elaborate precautions against a recurrence of inundations from the Seine, which devastated a large section of Paris nearly three years ago. Still other improvements are provisions for housing the poor upon which the city is to expend $40,000,000, to the end that the poor of Paris of French nationality may be cheaply, conveniently and well housed. Evidently times and opinions in Paris have changed greatly since the forties of the past century, when Théophile Gautier, wearing a red vest and drawn in a little cart by his trim ponies, made sport of the humble bourgeoisie whose Sunday diversion consisted of visiting the well of Grenelle or taking a walk by the ramparts now to be razed.

A Japanese View of Japanese Christianity

In a Japanese magazine Mr. Uchigisaki has published a long essay on Japanese Christianity of no little interest, for a knowledge of which we are indebted to the monthly summary of the religious press in the Japan *Mail*. It is of interest enough for us to give the salient points of it to our readers. Let it be remembered that the writer of the essay is a Unitarian Christian.

The Catholic Church, he says, gives much importance to ceremony and music, and its converts are mostly uneducated people, while among the educated classes its work has gained little fruit, because its priests fail to realize where educated Japanese stand in regard to current thought. Yet the Church has a great history, and will have a great future in Japan "while there are a very large number of people who entertain great respect for authority in the matter of religion."

Of the Greek Church he speaks more sympathetically. It has 30,000 adherents, and it has two elements of strength: it does not meddle with politics, and it employs native instead of foreign workers. Bishop Sergius is a very great organizer, and the Church has a bright future.

Of the Protestant sects the Congregationalists are noted for their able preachers, and "they have exercised a powerful influence on business men in Kioto, Osaka and Kobe" and elsewhere. "The sect is progressive in character," has three well known literary organs, and "if worthy successors can be found, will yet undergo much development."

The Presbyterians pay special attention to education. "Tho in thought far less progressive than the Congregationalists, it displays devotion and serious-mindedness that impress many people." It seems to have had great influence with officials.

The Methodists, says our writer, "appeal to feeling rather than to reason, so that, while their influence among the learned is not great, they get hold of business men and country people." Their churches are well organized, and they have two good educational establishments. If they can assimilate the food provided for them in their progressive official organ they have a future, "otherwise their prospects are by no means rosy."

The Episcopalians have a very powerful backing and very good schools, but of their literary organ the writer has no good word to say, while their theological organ, *The Four Seasons*, is "unrivaled in this country as an exponent of advanced theologic thoughts." The attachment of the Church to ceremony is in its favor, as the Japanese are a very ceremony-loving people.

The Baptists do not hold a prominent position, for they have paid too little attention to education. They are behind the age, and their prospects are not encouraging.

The Salvationists are fairly successful, and as their movement seems to suit a number of young people of both sexes, it looks as if they had a future in Japan.

The Liberals include three sects, the German General Evangelical Protestants, the Universalists and the Unitarians. The German body was once powerful and represented the higher criticism, but of late has been on the wane, and its theological school has been closed, and it is doing very little The same may be said of the Universalists. whose future depends on one man, Mr. Keirn, remaining in the country. Of the Unitarians, to which body the writer belongs, he says they have small congregations, and no such support as have the other churches. "The more bigoted and narrow-minded people are, the readier they are to provide money to propagate their biased opinions." The liberal section of Japanese Christendom has exercised a wide influence on thought, but is deficient in earnest evangelists. They would have spread all over the land had they had an apostle like the Catholic Xavier or the Greek Nicolai. They have lacked devoted, self-sacrificing men. "Learning and the higher criticism are all very well in their way, but it is not by these alone that religion is rendered popular. Unless our liberal-minded Christians can turn out a man like Neesima, there is little prospect of our eventually succeeding." He goes on to claim that they have won to their side a very large number of Congregationalists, a section of the Methodists, and that there are none of the Protestant bodies that have remained uninfluenced by their ideas.

THE WEEK

Not to Share in the Chinese Loan

President Wilson has withdrawn the United States from the Six Power group that was intending to loan $125,000,000 to China, and thus has repudiated the policy of President Taft and Secretary Knox concerning this matter. Since March 4 the syndicate of New York bankers (J. P. Morgan & Co., Kuhn, Loeb & Co., the First National Bank and the National City Bank) which had been urged by our Government to participate in the loan, has asked Mr. Wilson whether he also would request it to participate. These bankers said they would not continue to seek a share of the loan if our Government should not expressly request them to do so. The subject was considered by the Cabinet on the 18th. Mr. Bryan was in the West, but he afterward published his approval of the action taken. President Wilson wrote and gave to the press a statement as to the policy adopted.

Having referred to the bankers' request for information, he said that they had been asked to participate because our Government (under Mr. Taft) desired that the good will of the United States should be exhibited in a practical way, that American capital should have access to China, and that the United States should be in a position to share with the other Powers any political responsibilities that might be associated with the development of the foreign relations of China in connection with her industrial and commercial enterprises. But the present Administration, he continued, had declined to request the bankers to take part, because it "did not approve the conditions of the loan or the implications of responsibility on its own part which, it was plainly told, would be involved in the request."

The conditions of the loan seemed, he added, to touch very nearly the administrative independence of China itself, and the Administration did not feel that it ought, even by implication, to be a party to them.

The responsibility on its part which would be implied in requesting the bankers to undertake the loan might conceivably go the length, in some unhappy contingency, of forcible interference in the financial and even the political affairs of that great Oriental state, just now awakening to a consciousness of its power and of its obligations to its people. The conditions include not only the pledging of particular taxes, some of them antiquated and burdensome, to secure the loan, but also the administration of those taxes by foreign agents. The responsibility on the part of our Government implied in the encouragement of a loan thus secured and administered is plain enough and is obnoxious to the principles upon which the government of our people rests.

Our Government, he said, earnestly desired to aid the Chinese people in every way that was consistent with their untrammeled development and its own immemorial principles. The American people were in profound sympathy with the awakening of the Chinese people and their aspirations. It also desired to promote the most extended and intimate trade relations between this country and the Chinese Republic. The Administration would urge and support the legislative measures necessary to give American merchants, manufacturers, contractors, and engineers the banking and other financial facilities which they now lack and without which they "are at a serious disadvantage as compared with their industrial and commercial rivals." This was the main material interest of our citizens in the development of China. "Our interests," he said in conclusion, "are those of the open door —a door of friendship and mutual advantage. This is the only door we care to enter."

It was thought that this statement foreshadowed an early recognition of the Chinese Republic; also, that probably the Administration would repudiate or reverse the policy of its immediate predecessors with respect to the financial affairs of republics in Central America and the West Indies. The announcement of our Government's decision caused surprise abroad. Germany, the ally of the United States in the project, felt hurt because no notice of it had been given. It was predicted that the loan would be dropped. In the British House of Commons, on the 18th, the Foreign Secretary had said that the terms of the loan were unanimously approved by the six Powers interested. The American bankers at once announced their withdrawal from the Six Power group saying that they had become interested in the project "not primarily for their own profit," but at the request of our Government and for the purposes which had been indicated by Mr. Taft in a message to Congress.

In Mr. Bryan's absence the Acting Secretary of State was Huntington Wilson, Assistant Secretary, who had resigned and engaged passage for Europe, but who con-

sented, at Mr. Bryan's request, to remain for a time. He was offended because his first knowledge of the decision was gained from the newspapers. In a long letter to the President he exprest his indignation, defended the policy which had been abandoned, and resigned again. His resignation was at once accepted.

It is reported that the Administration preferred to have the United States deal directly and independently with China, and desired to convince China that its dealings would be distinctly of an unselfish character; also that Mr. Wilson has offered the post of Minister to China to John R. Mott, Foreign Secretary of the International Committee of the Young Men's Christian Association.

Coming Tariff Legislation

In preparing the tariff bills which will be laid before Congress at the special session, and which will, in the main, be in accord with the bills heretofore supported in the Democratic House, some differences have arisen between a radical group and what appears to be a majority of the Democratic members. For example, the radicals asked for free wool, but a majority in committee voted for a duty of 20 per cent. It is predicted now, however, that harmony will prevail.

President Wilson shows a lively interest in the projected legislation. It is understood that he will occasionally visit the Capitol during the debates, and that he desires the Democratic leaders to call upon him frequently at the White House and to keep him thoroly informed as to the situation. An income tax bill will be taken up after passage of the tariff bills. No decision has been reached as to the provisions of this bill, but there is an inclination to make the tax a graduated one. Much will depend upon the reports of experts as to the loss of revenue that will be due to tariff reductions.

The Diplomatic Service

President Wilson has been urging William F. McCombs to accept his invitation to become Ambassador to France. Mr. McCombs's final decision that he could not afford to take the office has led the President to express his regret publicly and to add some remarks about the diplomatic service. Mr. McCombs found that his private income, with the salary of the office, would not be sufficient for the maintenance of such an ambassadorial establishment in Paris as would be expected. He also felt that he ought to continue in the practice of law. The President says that the office could have been accepted only at an unreasonable sacrifice:

> It is a great pity that the country has to ask such sacrifices of those who are invited to serve it abroad —a service which every year becomes more exacting and more important. The sacrifice of time, of means, and of opportunity at home is very serious for any but men of large means and leisure, and the diplomatic service is unnecessarily hampered.

Dr. Charles W. Eliot, formerly president of Harvard University, has declined to be made Ambassador to Great Britain. It is understood that the similar post at Berlin has been offered to Professor Fine, formerly dean of Princeton University.

The Situation in Mexico

There was much fighting in the northern states of Mexico, last week, in the vicinity of the American boundary, where the followers of Governor Carranza were, as a rule, successful in engagements with Huerta's troops. Near Monterey, 400 Federal soldiers deserted to the rebels, and General Ojeda, hemmed in at Naco, on the Arigona border, lost a part of his small force in the same way. He had embittered the rebels by shooting several prisoners captured during the preceding week. The lives of those who consented to join his men and support Huerta were spared. Among those who refused was Colonel Gutierrez, and he was promptly executed. The Federal garrison at Nuevo Laredo was attacked by Carranza's men. Their leader was a woman, waving a large red flag. At the very beginning of the engagement she was killed. The rebels were repulsed. Three thousand residents of the town had fled across the Texas line for safety. General Trevino, Governor of Nuevo Leon, resigned his office. This caused surprise. He had been a loyal soldier. It was generally believed that his action indicated disapproval of Huerta's rule.

At Naco and Cananea were the only Federal garrisons in northern Sonora. It was expected that these would be forced to surrender. The rebels were slowly moving westward, their objective point being Guaymas. Our Government sent two cruisers from San Francisco to the west coast in the vicinity of that town. The Governor of the State of Tepic opened the jail doors there and, with the men thus liberated, joined Carranza's rebels.

Abram Gonzales, recently the Maderist Governor of Chihuahua, has been killed by a use of Mexico's convenient fugitive law. He was in custody and was to be tried for conspiracy or sedition. Several of the members of a firing squad that shot him as he was "trying to escape" have told the story. Colonel Alcalde, recently the editor of a

Maderist newspaper at the capital, who escaped in disguise and made his way to San Francisco, says he has proof that Madero was stabbed to death in the palace and that Suarez was strangled there. He severely criticises Ambassador Wilson. It is understood that the congratulatory dispatch sent by Secretary Bryan to the Ambassador has been recalled or cancelled.

There has been very little news from the capital. Ignoring precedents, President Huerta called upon Ambassador Wilson and assured him that steps would promptly be taken for an adjustment of American claims. Foreign Minister De la Barra's brother has sailed for Europe to negotiate a loan, as the Government is greatly in need of money. It is said that a plot for the assassination of Huerta by palace guards was recently discovered, and that several persons implicated have been put to death.

Other Countries South of Us

About two-thirds of the people on the Isle of Pines, which belongs to Cuba, are Americans, and they pay 97 per cent of the taxes. They would like to have the island annexed to the United States, and they have been making a campaign in preparation for an appeal to our Government. This offends the Cuban Government, and it is said that several of the agitators have been threatened with prosecution for treason. Mr. Bryan recently visited the island, and anti-American newspapers in Havana are saying that he has led the American residents to expect his support. The amnesty bill, to which Mr. Bryan, as Secretary of State, emphatically objected, was much narrowed in its application before its passage by the Cuban House. The Senate has rejected the bill as thus modified, and it is asserted that the Senate prefers the original measure, which our Government condemned, and which would release thousands of criminals.

At the recent session of Porto Rico's Legislature bills regulating the work of children and women, for employers' liability, for the construction of roads and bridges, and for increasing the revenue derived from cigars and liquors, were passed. A commission instructed to oppose the removal of our sugar duties will be sent to Washington.

Manuel Bonilla, President of Honduras, died on the 21st. He had been ill several months. Some feared that his death would be followed by revolutionary disturbances, but the latest reports show no disorder. Bonilla gained office by revolution. His successor, Vice-President Bertrand, is said to have much popular support. In the British House of Commons, last week, a representative of the Government said he understood that action at Washington upon the new treaty, by which Nicaragua grants to the United States exclusive canal rights and a naval station, had been postponed indefinitely. Dispatches from Hayti say a revolution is expected there and that many suspected persons have been arrested.

The Canadian Navy Question

It seems now to be the expectation at Ottawa that no further progress will be made with the navy bill—the bill for a contribution from Canada of $35,000,000 for the building in England of three battleships to be given to the British Admiralty—until there has been another general election; and that a redistribution bill giving due representation to the Western Provinces will be quickly past thru both Houses before Parliament is dissolved. The farmers and grain-growers are opposing the navy policies of both the Liberal and the Conservative parties. They consider the increase of armaments a menace to peace, and they desire to keep Canada entirely free from the competition in military and naval strength which is draining the industrial resources of Europe. In addition to this opposition, the Borden Government is now being sharply criticised by many of its former friends for its willingness to accept for Canada the subordinate position implied in Mr. Winston Churchill's letters. The British First Lord of the Admiralty wrote in reply to questions put to him by the Canadian Prime Minister, and evidently tuned his letters to Mr. Borden's wishes. His assertions, however, that "it would be wholly unwise for Canada to attempt the building of a battleship" and that "the idea of building capital ships in Canada is impracticable" have raised again the old question of Canada's manufacturing ability. On no subject is Canadian opinion more sensitive. The theory of the older English colonial system that colonies were to produce raw materials and to buy manufactured goods from England was vigorously repudiated in Canada as early as 1852. The national policy of 1879 was designed to build up Canadian manufacturing; and to be told in 1913 that Canada cannot get together the necessary equipment for the building of a battleship is a sore affront to Canadian pride. Mr. Borden read the letters from Mr. Winston Churchill in the House of Commons on March 11, to strengthen his own position. Apparently instead of strengthening it he thereby dealt a fatal blow at the policy of a colonial contribution to the British navy.

England's Troubles

One of the recent outrages of the British suffragets is the burning of the country residence of Lady White, widow of the general who defended Ladysmith against the Boers. This house, which stood near Staines, was unoccupied. Its owner has taken no active interest in the suffrage movement, nor was the late Field-Marshal ever concerned with the propaganda. Public feeling in England is now active against the agitators, who are frequently saved by the police from mauling by angry mobs. Hysterical women have greeted Mrs. Pankhurst with cries of "Why don't you blow up Asquith?" and "Shoot him!" These suggestions followed the speaker's account of the forcible feeding of her daughter, Sylvia, until a few days since a prisoner in Holloway Jail. The Government has been criticised by the Opposition for its failure to cope with the militant women. Lord Robert Cecil, a suffragist member of the Unionist party, told Parliament that the policy of the militants was "An attack upon the liberty and civilization of the country" verging upon lynch law. The ordinary legal forms were of no effect in dealing with fanatics, he continued, and the Government ought therefore to "provide some new form of punishment or preventive measure." He recommended deportation.

Mr. Justice Eady, in the Chancery division of the High Court of Justice at London, has made a compulsory order for the winding up of the Peruvian Amazon Company, whose methods of trading in the Putumayo district of South America are being inquired into by the British Government.

The Prince of Wales has gone to Stuttgart, where, as the guest of kinsfolk, the King and Queen of Würtemberg, he will gain practice in the German language. He is to be gone several weeks, but will not visit Berlin. The British heir has been promoted to a naval lieutenancy.

France's Parliamentary Crisis

The resignation of Aristide Briand as French Prime Minister on March 18 closed the life of a short-lived ministry. M. Briand, whose second government this was, was named by M. Poincaré when the latter's election as President left the Third Republic without a ministerial head. And the President was inaugurated as recently as February 18.

The fall of the Briand ministry was, like that of many another, due to an attack by Georges Clemenceau. There is piquancy in the fact that Briand formerly served as Minister of Public Worship, and as Minister of Justice, under Clemenceau. It was then that he reported the Separation Law. But the present crisis resulted from the defeat of a bill providing for proportional representation of minorities in the Chamber of Deputies, a measure of M. Poincaré's. The reform of the representative system has been agitated in France for some years; this particular measure was made the subject of an article by Prof. J. S. Schapiro, of Harvard, in THE INDEPENDENT of August 29, 1912.

It was the Senate, and not the Chamber of Deputies, which administered this defeat of M. Briand's. Only twice before, in the more than forty years' existence of the present Republic, has a ministry been so defeated. And the Senators' veto, regarded as a slap at true democracy, and at the President, as well as at Briand and his majority in the popular house, may possibly lead to a campaign against the Senate and a demand for altering its electoral system: propaganda on the lines of the Liberal party's against the House of Lords. The Government bill for the proportional representation of minorities (seemingly especially just in a country where the "group" system prevails, rather than the two-party system) was voted by the Deputies in July, 339-217. The bill was fatally amended by the Senators, 161-128.

M. Briand's successor is Jean Barthou, his Minister of Justice. M. Barthou will, however, hold the portfolio of Public Instruction, yielding that of Justice to Antoine Ratier. Charles Dumont will be Finance Minister; Etienne Pichon, Foreign Affairs; Louis Klotz, the Interior. The Ministers of War and Marine, Etienne and Baudin, are unchanged. The other ministers are MM. Clementel (Agriculture), Morel (Colonies), Thierry (Public Works), Choron (Labor), and Massé (Commerce and Posts).

It remains to be seen whether M. Barthon, too, will fall a victim to the spiteful Clemenceau, the chief of the Republican malcontents, and of all those jealous of Poincaré, or hostile to Delcassé and Briand. M. Delcassé is the newly appointed Ambassador to Russia, who has just presented himself in this capacity at St. Petersburg. "The Flea" (as he is named by reason of his low stature, alertness and lack of facial beauty) served under Poincaré as Naval Secretary, but is best remembered as the Foreign Secretary who, less recently, incurred the wrath of Germany, and lost his head at Germany's

demand. This was in the early stages of the Moroccan question, now settled in France's favor. M. Delcassé's stock has risen in late months. His appointment to Russia is found alarming in Germany, and it is asserted that he goes to the court of France's ally on a secret mission of no small import. Questions of European politics have usurped the place of domestic problems, as a matter of fact, and the population is much more interested in the lengthening of the term of military service to three years, and the increase in military and naval appropriations promised by the Government to offset German aggrandizements, than in the electoral reforms undertaken by a former Government.

A New Ruler for Greece

King George I of Greece, while walking in the principal street of Salonika on March 18, was shot by Aleko Schoinas, a Greek, and died within half an hour. The regicide, armed with a revolver, approached his victim from behind.

The late King of Greece was a Danish prince, second son of King Christian IX. He was born at Copenhagen, December 24, 1845, and was christened Christian William Ferdinand Adolphus George. While a midshipman, aged eighteen, he was made king of a country which he had not at the time visited. The choice of George as King of the Hellenes followed a revolution which in 1861 displaced Otto of Bavaria, then King, who had attempted to override the Constitution. Before it was offered to George, the Greek throne had been declined by the Duke of Edinburgh and the Duke of Saxe-Coburg-Gotha. The Duc d'Aumale, younger son of Louis Philippe, was also "mentioned." The reign of the Danish prince began in 1863; four years later he married the Grand Duchess Olga Constantinova of Russia. Six children, of whom the youngest was the only daughter, were born of this union, the oldest, Constantine (born 1868), now becoming King of Greece.

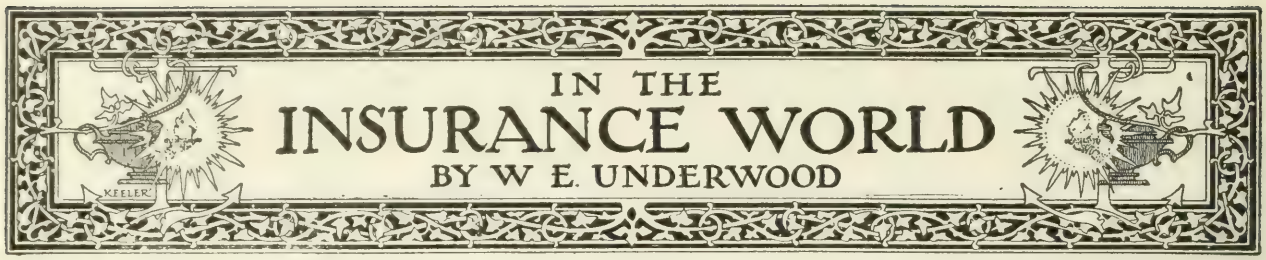
The late reign has been marked by partisan conflicts within, and two wars with Turkey—1897 and 1912-1913. In 1898 an attempt upon the life of the King was made in the suburbs of Athens. Last week's assassination took place in one of the two important towns captured by King George's troops in the second Turkish war of his reign. The murderer is said to be an anarchist, a university graduate, and a former resident of New York. This last particular is hearsay.

The present dynasty in Greece is closely related to many ruling houses in Europe. King George was the brother of England's Queen Dowager, Alexandra, and of the Empress Dowager of Russia. The late King's consort is a cousin, also, of the present Czar of Russia. Haakon VII of Norway and Christian X of Denmark are nephews of the late King—and these are only a few of the royal connections. Constantine, who now comes to the Greek throne, was formerly disliked in his kingdom, but has won popularity by his course as a soldier. Tho he becomes King Constantine I, his name is no novelty in the history of his country. The last Byzantine Emperor, whose reign closed with his death and the taking of his capital by the Turks in 1453, was a Constantine. The new ruler is a tall, soldierly man, reserved in public and private. German tutors educated him, and he is a brother-in-law of the German Emperor, having married at Athens, in 1889, Princess Sophia of Prussia. When the latter became a member of the orthodox Greek Church the Kaiser was offended in his Lutheranism, and it is said that relations have been strained between the brothers-in-law since that time. Constantine has five children, the prince royal, George, having been born in 1890. Besides Prince George there are two younger brothers and two sisters.

Constantine has acted as regent in recent years, his father, the late King, having preferred residence at Paris and Aix-les-Bains to his own capital. It is said that King George planned to abdicate at an early date. Constantine, with his late father and eldest son, left Athens on October 12, 1912, for the campaign against Salonika, which was captured November 8, Janina in Epirus not having capitulated until March 6. These triumphs were at once the crowning events of George's life as King of the Hellenes, and the foundation of the new King's newly won popularity. When the Greeks of New York City wished to commemorate the capture of Salonika some weeks ago they raised by subscription $3000 to purchase a sword for presentation to Constantine. This sword of Toledo steel with a jeweled Byzantine hilt of gold is the work of a New York maker, and is inscribed, "To Constantine the Liberator, from the Greeks in America, 1913." It was blessed on March 16 with elaborate ceremonies, and will soon be presented to the new ruler.

The Greeks have a tradition that when a Constantine sits again upon the throne the Eastern Empire will be revived and the Cross raised to the dome of St. Sophia in Constantinople, which has borne the crescent for six centuries.

Austria and the Near East



Austria has presented an ultimatum to Montenegro demanding a suspension of the military operations around Scutari until the entire civil population has left the town. In case of refusal Austria will resort to arms against Montenegro. In a previous note Austria demanded that all Catholic and Mohammedans in Jakova and surrounding districts who had been converted since the Montenegrin occupation must be restored to their former faith. Italy took similar action, but without expressing any threat, and Russia, the friend of Montenegro, advised the Montenegrin Government to accede to Austria's demand. Montenegro replied that she proposed to appoint a commission, on which, besides the Montenegrin members, there should also be one representative of Austria and another of Italy or some other great Power. Montenegro at the same time stated that she could not allow the sovereign rights of Austria to be exercised in territory occupied by Montenegro. Austria refused to accept the answer to this note.

It is stated that the Catholics and Mohammedans of Ipek and Jakova exprest a wish to join the Orthodox Church, but were dissuaded by the Montenegrins, who advised them to exercise patience. The movement spread, however, as the people were unable to understand why they should not return to the old faith, of which they had preserved the usages. When they repeated the demand their wish was granted.

News from Montenegrin headquarters indicates that King Nicholas believes the fall of Scutari is imminent. He is in command of the combined Servian and Montenegrin army, numbering 52,000. From these sources it is reported that the city has already been partly destroyed, all the large buildings having been damaged. Famine prevails, and it is reported that many Austrians and Italians have been killed.

KING GEORGE OF GREECE AND HIS SUCCESSOR, CONSTANTINE, ENTERING SALONIKA
The late King is the nearer horseman; his son, mounted on a black steed, rides at his side.

Should Not Be Commercialized

Touching lightly the subject of life insurance by the State, Superintendent William T. Emmet, of the New York Insurance Department, is not sure that the time will ever come when his State will decide to go into the business; but he is quite convinced that the people will never again permit the companies to conduct it primarily for personal profit to stockholders. He believes that public opinion has reached that stage that will compel private capital invested in it to take only the most moderate returns, leaving the balance of such profits as accrue for distribution among policyholders.

He is sound in these conclusions and whether public opinion does or does not actively exert any pressure in that direction, the fact remains that the making of money by stockholders out of the business of life insurance is, to the buyers of that class of protection, a form of extravagance against which they should be protected. What is commonly called old-line, legal reserve life insurance needs no capital, particularly after a company is fairly started on its career. In this matter the laws of most of our States are at fault. They render it extremely difficult for any one desiring to do so to organize a mutual company This condition of affairs, we fancy, is a remnant of the questionable legislation of former years, when certain powerful interests dictated the enactment of such laws as would protect the monopoly they controlled against the invasion of competition.

Altho the proper administration of the affairs of a company which provides protection against the losses due to death require the application and exercise of rigid business principles, there is not that commercialism in it that is so pronounced a characteristic of other enterprises involving the exchange of money for commodities or services. Life insurance is a co-operative effort against the effects of the greatest human affliction; it is endowed with a large measure of sentiment; commercially, there are no profits; all the participants are burden-bearers; and, therefore, the exploitation of the service as a maker of money by capitalists is distasteful.

In our judgment the growing business of workmen's compensation insurance will eventually occupy the same position—that of a service too noble in its objects to be permitted to become a money-making enterprise by capitalists.

Supervision

The recent failure of a Pennsylvania fire insurance company under conditions which promise to be scandalous when the whole story is revealed, emphasizes the existence of a glaring defect in the system of State supervision. The laws regulating and defining the financial qualifications of insurance companies are admittedly very complete and, properly enforced, policyholders incur little if any risk of loss due to insolvency resulting from dishonesty or mismanagement. Under these laws it should not be possible for a company to become a financial wreck between annual statements —that is within the period running from January 1 to December 31 of any year. A comparison of successive financial statements should reveal to the practised eyes of Insurance Department accountants some indication of managerial irregularity if there has been any. That there is ground for this assertion is borne out by the fact that the condition of the American Union Fire Insurance Company of Philadelphia fell under the suspicion of the Insurance Commissioner of North Carolina, and that it was upon his suggestion that an examination of the company was undertaken by the departments of New York and Pennsylvania. That investigation revealed an astonishingly bad state of affairs.

It is not unreasonable to assume that the Pennsylvania Insurance Department was in a position to prevent a failure of the character and magnitude of that which became the fate of the American Union. There is no branch of a State's government which is endowed with more power of an autocratic kind. With or without justification, an insurance commissioner may arrest the operations of an insurance company until the courts have past upon the causes which prompted his action. In innumerable directions his instructions may be arbitrary to the verge of tyranny, and in a great many instances they have been too much so. But for one reason or another, apparent when too late, their activities have seldom re-

sulted in saving a company from insolvency. To this extent the reliance placed by policyholders in supervisors is not fully earned by the latter. Herein lies the defect of supervision.

Department examiners are empowered to visit and investigate at any time all the companies within their jurisdiction. This authority should be more frequently exercised. Such a procedure is inconvenient to companies, but those of them that value the good name of insurance as an institution would cheerfully submit to it if, thereby, such a rank failure as that of the American Union could be prevented. Let the examiners call unannounced, at times when not expected, and in this way keep all managerial eyes that may be inclined obliquely straight to the front.

Made Good Progress

In point of assets the United States Annuity and Life Insurance Company of Chicago is nearing the million dollar mark, the figures on December 31, 1912, being $990,461, indicating a gain for the year of $258,390, a measure of progress which should be highly gratifying to the policyholders and management. Last year the company issued new insurance for a total of $5,243,739, while its whole volume of outstanding insurance reached $11,419,962, an increase of $1,666,708. It again gave unusual attention to its existing business in 1912 and succeeded in renewing 76 per cent of it—a very high average. The conclusion to be drawn from its annual statement is that the company is prospering abundantly.

The New Amsterdam Casualty

As the business of liability insurance developed, particularly during recent years, the necessity for maintaining heavier proportionate reserves each succeeding year became plainly manifest to managing underwriters in that line of business and to State supervising officials. There has been complete harmony on this head between the companies and insurance commissioners with the result that as the need for these reserves were increased they were provided either from surplus funds or by stockholders. Under the processes of evolution, employers' liability insurance is now beginning to decline in volume and is being gradually displaced by that of workmen's compensation, the reserves for which are to be heavier than those for the liability line.

All the casualty companies are preparing their treasuries for the change, the latest among them being the New Amsterdam Casualty Company of New York, the stockholders of which late last year made a substantial addition to its cash capital and surplus. The balance sheet of this company on December 31 last, exhibits total assets of $1,283,461, and a surplus on policyholders' account of $507,911. The company has apportioned to unearned premium account a reserve of $466,500 and for contingent losses $239,912, which, with the surplus indicated, places back of its contracts cash securities aggregating $1,214,322, thus providing policyholders with the fullest protection.

Notes

R., Vineyard Haven, Mass.—After carrying a ten-year term policy six years, the policyholder surrendered this policy and took a twenty-payment life policy in the same company. In settling with the agent the company deducted the commission paid the agent on the term policy from the commission of the twenty-year policy. In your opinion, was this a fair settlement?

Yes, we think it fair. You describe one continuous transaction. The settlement of commissions indicated follows the usual custom of the companies.

The Maryland Casualty Company has declared a dividend of 5 per cent for the quarter year ending March 31, thus placing the stock on a 20 per cent basis, an increase of 2 per cent.

The Legislature of New Jersey has appropriated $50,000 as the foundation of a million dollar fund, designed eventually as an insurance fund against loss by fire of State buildings.

The first exclusively women's agency in New York City has been established by the Equitable Life with ten women agents under the direction of Miss E. Marie Little. Miss Little got her experience as stenographer for twelve years with one of the busy metropolitan branches of the company.

A Philadelphia dispatch to a morning newspaper last Saturday states that James F. Stone, president of the failed American Union Fire Insurance Company, now absent in Europe, has been indicted, presumably in connection with the false statements appearing in the company's sworn financial report of December 31.

John D. Browne, for the past thirty-three years president of the Connecticut Fire Insurance Company of Hartford, Conn., died suddenly at his home in that city Sunday night, March 23, of apoplexy. He was seventy-seven years old, a native of Plainfield, Conn., and from 1856 to 1870 a resident of Minnesota as the Western representative of several Connecticut companies. In the latter year he was elected secretary of the Hartford Fire Insurance Company, becoming president of the Connecticut Fire ten years later. He is survived by two daughters.

FINANCE & TRADE

The Harriman Fortune

At the time when the official inheritance tax appraisal of the late E. H. Harriman's estate was made, the valuation of the property, as shown by a report filed at Albany last week, was $69,686,654, of which all but about $3,000,000 was personalty. Since that appraisal was completed, the market value of the bonds and stocks has been decreased by about $11,000,000. Nearly all of this great fortune was accumulated by Mr. Harriman in less than twelve years.

The list of his bonds and stocks is a very long one. It fills nearly two columns of fine print in a newspaper. He was a shrewd trader and, as a rule, a very successful investor, but the list contains many shares and a few bonds which are now worthless. There are holdings of bonds in five companies (par value $77,957) marked as having "no value," and with these are about 40,000 shares, in thirty companies, marked in the same way. The par value of these worthless bonds and stocks was a little more than $4,000,000. The companies included railroad, beet sugar, gold mining, road building and cotton compress corporations, but the largest items were common and preferred shares of the Sinnemahoning Iron and Coal Company, having a par value of $3,553,326. It does not follow, of course, that the loss on these holdings was $4,000,000, but there must have been some loss, and the list indicates to some extent the errors of the owner. Other millionaires have erred in the same way. In Russell Sage's estate of $66,000,000 there were worthless shares having a par value exceeding $500,000, and in Jay Gould's estate of about $75,000,000 there were worthless holdings whose face value had been nearly $2,000,000.

Stock Exchange Incorporation

In the New York Assembly, last week, eight of Governor Sulzer's bills relating to the Stock Exchange were advanced to a third reading. One of these is the bill compelling incorporation of the Exchange. This bill, however, has almost no support in the Senate's Judiciary Committee, where thirteen of the fifteen members have voted against it. Thousands of telegrams in opposition to this measure have been received by members of the Legislature, together with the arguments and protests of prominent organizations. The special committee of the New York Merchants' Association, whose opposition to the proposed increase of the tax upon transfers of securities had much weight, has submitted a report (which the association has approved) in which the incorporation bill is opposed on the following grounds:

> The effect of this bill would be, in our judgment, to regulate the government of the Exchange by inflexible provisions of statutory law. The widest possible latitude should be extended to the good judgment and discretion of the duly constituted authorities of the Stock Exchange, so that they can at any time make regulations adapted to the conduct of business on the Exchange and enforce the same by the present summary method, without the delays and hindrances which would necessarily follow upon the fixation of such regulations in a statutory form.
>
> In no other way that we can see will the Stock Exchange, as at present, be able at any time, without delay, to make such changes in the customs and rules as are needed to remedy injustice arising from new or changed conditions. The rapidity with which new and perhaps injurious methods can be introduced in a business so mobile and flexible as that conducted on the Exchange can in no other way be matched by an equally prompt and flexible method for their regulation, conducted by men who are thoroly familiar with all the conditions surrounding the business.
>
> The provision that the seat of any expelled member of the Stock Exchange should be sold at auction to the highest bidder would, in our judgment, enforce upon the Exchange acceptance of such a person as a member, in spite of the fact that his character and methods might be such as would make him an undesirable associate in a system founded on mutual confidence.
>
> The bill also endows the Stock Exchange with considerable banking functions which it does not now possess, and which we believe are undesirable. In short, this bill, in our judgment, would deprive the rules and regulations of the Stock Exchange of that flexibility and quick adaptability to the changing conditions of business which we feel are essential to the proper conduct of so large and important a branch of the trade and commerce of New York.

We believe that this bill ought not to become a law.

Of the 22,716 shareholders in the New York, New Haven & Hartford Railroad Company, 10,102 are women.

Mr. Roberts, Director of the Mint, predicts that the output of gold will not increase materially during the next ten years.

The Census Bureau's report on the cotton crop of 1912, issued last week, makes the yield 14,295,500 bales. This total may be compared with 16,250,276 bales in 1911, 12,005,688 in 1910, 10,004,949 in 1909, and 13,587,306 in 1908.

The Mercilessness of Nature

We have heard much of the mercilessness of the Yangtse, the deadly river of China. We have now learned more than we had suspected of the mercilessness of our own great river. Who would have thought that here, in our own country, the gentle rain from heaven, twice blest, could be so doubly curst, leagued with the tornado to destroy populous cities and devastate smiling fields and slay its thousands in their homes? Nature is bountiful, gracious, in her ordinary placid course, but when she will she breaks out in rage and cares not, in mad earthquake and whirlwind and storm what or whom she ravages. Therefore, if she is wilful, we must pit our wit against her wilfulness and try to curb her fury.

So we challenge the earthquake with our low buildings and solid foundations. We erect houses of concrete or stone which the fiercest tornado cannot blow away, or hide ourselves in caves in the ground till the storm be overpast. We build our ships to be, we fondly hope, unsinkable. But what shall we do when all the boundless sky conspires to pour down at once its floods of ruin? Can we run away from the rivers and build our warehouses and homes on the summit of the hills? That is not easy. Can we bank the rivers and imprison their waters? We have been trying it for many years, but the levees break thru, and the planted meadows are washed away. The loss in crops is greater than the loss in buildings. Not yet have we learned to build levees high enough and wide enough to resist the flood that falls once in a century, when Nature does her maddest.

They told us a few years ago that the floods are worse than they were, because we have cut down the forests, and this is our punishment. We are not so certain now; the men wise in weather do not believe it. They do not see why the thickets that follow the big trees cut here and there cannot hold the rains as well as the loftier forest. They are not so sure that the forest mold is more of a sponge to hold the water than is the mellow cultivated field. They doubt much if the floods are worse now than they were in the older days when there were no inhabitants to suffer from them. There is no more evaporation from the ocean, no more rain from the sky. That which is, as the wise man tells us, is that which hath been.

What remains is, at leisure, to build banks to restrain and reservoirs to impound the floods. What remains, in haste, is to give generously for the relief of sufferers and tenderly to bury the dead. It is not for us to rebel against the beneficent laws of Nature, or, like the wife of Job, to curse Nature's God, but to accept the occasional evil incidental to the prevailing good, and build better and guard better, and to remember that intelligence can use Nature's laws to mitigate or overcome all her mercilessness.

Why This Waste?

While we bemoan the loss of life by tornado and flood, and devise means to prevent it, we are never weary of multiplying inventions to destroy life in war.

We even rush into war in mad delight, as if the killing of men were the surest path of glory. Even when, as in the present Balkan war, the ultimate purpose has been achieved and peace is offered and in sight, when by the tens of thousands their choicest youth have already been slain, the victors offer as holocausts more victims from their own thinned ranks, that they may slay uselessly as many more of their foes; and all that they may take by force the Adrianople already offered them as their prize in war. We ask, Why this waste?

We presume that the civilized world expected that the struggle to capture the fortress would cease, now that its possession was assured; for we thought that Bulgarians and Servians would add up the cost in life already paid, and would save the lives of the too few that remained. But not so did they reckon values. They felt a certain shame that peace should come before the siege had ended with successful assault. The generals and the soldiers alike did not value life as they valued glory. They were willing to lay down their own lives for honor, and we doubt not that the wives and sisters who followed them, and the widows of the dead who wept at home, equally joined in the cry that Adrianople must be taken before peace was declared. It should not be given by the Turks; it should be taken from the Turks.

Is such a sentiment, such a passion, justified? Surely not, in cold reason. And yet we sympathize with it. We say it was not wise, but was grand. Montenegro feels just so. She has not captured Scutari, but she will, she must, even if Austria and all Europe forbids, and if it costs all her little army. Shall Bulgaria take Adrianople, and Greece take Janina, and shall Montenegrins, bravest of the brave, not do their part and capture Scutari? Not life, honor is the subject of their story.

It is all a question of values. It is an old saying, "All that a man hath will he give for his life," but it was Satan that said it when he went to break the spirit of Job. It is the ignoble of whom Satan's word is true. It is a noble passion which gives life for values greater than life. Patriotism and religion join in this award. The Roman who leaped into the chasm; the Swiss who gathered to his breast the Austrian spears and made way for liberty; the mother who saw her seven sons die taunting the Syrian oppressor rather than disobey the law of Moses; the multitudes who triumphed in the glory of martyrdom in the Roman persecutions, all despised the Devil's claim that all that a man has will he give for his life.

To be sure, we mourn with the living the loss of their dead; of those who rushed proudly to death in attack or defense, the brave on both sides; but we consider what is the total aggregate of confidence, courage and strength this success will give the nations. Thru the generations they will say, "This our fathers did; for their country they valued not their lives; by the tens of thousands they fell for our liberty; they drove out our oppressors; they took by deadly assault the strongest citadels; we must be worthy of such fathers; ours is a land consecrated by holy blood to liberty." Thus there will arise a new and great nation baptized to freedom and justice and truth. This is what those meant that died in the bayonet charge, and this is what we hope will be the purchase of a fearful price.

Tariff and Income Tax

The Democratic party has a very large majority in the House, and the elections in Illinois give it a majority of six in the Senate. Its tariff bills which, before March 4, were opposed by a Republican Senate and a Republican President, will now become laws. They have been prepared and are soon to be published. Business and the manufacturing industries have thus far been only slightly affected—if, indeed, they have been affected at all—by the impending revision of a long list of tariff duties.

Mr. Wilson has shown much interest in the tariff program. The revision bills have been submitted to him, and it is asserted that they have his approval. Not long before his election he said that tariff changes should be made "only at such rate and in such way as will least interfere with the normal healthful course of commerce and manufacture."

He also said, after the election:

> No man whose business is conducted without violation of the rights of free competition and without such private understandings and secret alliances as violate the principle of our law and the policy of all wholesome commerce and enterprise need fear either interference or embarrassment from the Administration.

Mr. Underwood, Democratic leader in the House and chairman of the Ways and Means Committee, remarked that he "would not injure any legitimate business." The Vice-President, Mr. Marshall, said:

> There is no occasion for any man to fear a panic. Democracy does not propose to overthrow at one stroke all the existing institutions. It is not our policy to destroy in thirty minutes what it has taken thirty years to create.

Our present tariff is too high. There are duties which should be removed; there are others which should be largely reduced. Such changes can be made in accordance with the doctrine of protection. When it failed to make them, or to revise sharply downward, in 1909, the Republican party was guilty of one of the greatest political and economic blunders known in our history. By this blunder the party was wrecked. It is true, however, that the party's action was misrepresented by some of its prominent opponents; for example, by Governor Dix when he asserted in a written statement that it had "increased the duties on all the necessaries of life." He must have known that it had not done this. As a rule, it had reduced those duties, but the reductions were slight and ineffective.

While the Democratic party rejects the protective doctrine, its legislators should bear in mind that protection has been the rule for a long series of years; that certain industries have been created by it; and that it has developed and enlarged others. It has affected the standard of wages. Where a duty, originally protective, is no longer required for protection it should be cut off. An industry that exports large quantities of its products exposes itself to the charge that it needs no tariff duty whatever. If those products are sold abroad at prices lower than those which our own people are required to pay, this indicates exasperating injustice to the people of the United States. It may also indicate an unlawful combination for control of the home market. The industry so offending invites the removal of its tariff duty. And yet it may be that the immediate removal of all of it would do more harm than good. In such a case, as in other cases, a gradual reduction might better serve the public interest.

We should like to see the tariff revised in accordance with the reports of a competent and permanent non-partisan commission, engaged in careful and continuous study of all the conditions involved, and we should like to see the revision made in such a way that log-rolling and bargaining would be excluded.

We hope that the bills soon to be discussed and passed will be just in every part, that they will be framed scientifically, that due regard will be shown for the legislative conditions under which various industries have been conducted, and that the changes proposed will not be such as will give any manufacturing industry a reasonable excuse for reducing wages.

It is expected, of course, that there will be a loss of revenue. When the free list is enlarged, the resulting loss can be very closely estimated. But in the case of reductions that increase imports, the effect upon revenue cannot be foreseen. There is to be an income tax to fill the gap. The levying of an income tax has been approved by THE INDEPENDENT. But we cannot see how the desired $100,000,000 or $110,000,000 can be raised by a tax of 1 per cent on incomes in excess of $4000, even if the rate be graduated upward for the much larger incomes. It does not seem unreasonable that those who receive great incomes should pay a higher percentage than is imposed upon those whose receipts are barely sufficient to pay their necessary current expenses. It is well understood that the income tax plan has not been completed, and that the details of it depend in part upon the reports of experts as to the effect of tariff changes. When it is known approximately how much the revenue loss will be, the merits of various forms of income taxation will be considered, we presume, with care and with regard for the experience of other countries.

For a Shorter Bible

We are reminded by a Lutheran pastor in this city, Dr. George W. Wenner, that an abridged Bible is not wholly unknown, that the plea made for it in an article last week was answered more than three hundred years ago by a man named Martin Luther. In order to popularize the reading of the Bible he publisht a collection of Bible stories called the *Passional*, at the same time expressing the hope that some one would arouse the interest of the people by making pictures for the collected stories of the Bible. The suggestion was followed by Fischart, who publisht Bible pictures and verses, a valuable work of art.

In the middle of the sixteenth century Hartmann Beyer, the reformer, of Frankfurt, publisht the first real Bible story book, with pictures, an undertaking which the Brunswick theologian, Justus Gesenius, imitated on a larger scale a century later. It had special reference to instruction in schools. For high schools, Melanchthon's pupil, Neander, had designed his *Historia Populi Dei*, 1582, which aroused great interest. Felicitous creations, with the same end in view, appeared in the latter part of the seventeenth century in the Sacred Histories of Sagittarius, Castellio and Fabricius. Huebner's *Bible Stories* appeared in 1714, and attained such widespread popularity that he has often been regarded as the founder of the Bible story method of teaching. Dr. Wenner tells us that he was brought up on Huebner, and at his mother's knee learned with never-failing interest the wonderful stories of the Old and New Testaments. But Huebner's way of telling the story, in a popular version rather than in the language of Scripture, came to be recognized as faulty. In 1830 Zahn's epoch-making *Bible Stories* appeared, in close conformity with the language of the Bible, and it has been the norm for the numerous books that have followed on this field.

There is not a school in Germany where the Bible story book is not used; and in most Lutheran churches in this country it is regarded as an indispensable adjunct in the religious instruction of children. Is not this the book for which Dr. Beazell has made his plea?

Dr. Wenner gives us the further interesting fact that some of his pupils have taken their Bible story book with them to public school, and during recess entertained admiring circles of their schoolmates by reading to them from its pages.

John Pierpont Morgan

The world's most distinguisht financier and one of its greatest millionaires on Monday last forsook his treasures of wealth and art, and past, as we must all pass, bare of everything but the character which the soul carries with it, into the life beyond.

Mr. Morgan was a great man. He might have attained distinction equally as scholar or statesman if he had not put his powers into the development of the wealth of the nation. He was the master organizer of great combinations of industry and traffic. Confessedly he stood at the head of the business life of the country. But he did not thereby incur the jealousy of rivals or the enmity of the ranks of labor, whatever might be said of the financial system of which he was a part. All thought well of him as a fair man, whose aims were for the general good, reorganizing bankrupt companies, while taking his share of the general profit. His share was large, for his work was large, and as a man of business he was not discredited, but honored.

And this was not all. He spent his wealth freely for the honor and enrichment of his country; and this not only in times of financial peril, when he stept into the breach, but particularly these many years while he made it his task, as president of the Metropolitan Museum of Art, to enrich the country with the choicest treasures of the Old World. For this purpose he spared no money, and he gave to it the same intelligence and industry that he gave to his financial business. These treasures, whether given to the museum or in his own wonderful library, are all the wealth of the nation.

Doubtless he chose well to use his great talents for the accumulation of

wealth, that he might expend it most honorably. And yet it is a strange fact that the poor man who pens noble words in stirring measure has a longer lease of life in the world's memory than crowned and uncrowned kings of thrones or finance, or patrons and dispensers of art. We doubt not that long after Mr. Morgan's fame of the day has past, his grandfather, John Pierpont's, battle-cry will be repeated from many lips:

Stand, the ground's your own, my braves!
Will ye give it up to slaves?

The New "Cure" for Tuberculosis

The newspapers of New York City and indeed of the country have been very much interested in an announced new "cure" for tuberculosis which is said to be in the hands of a comparatively young medical scientist from Berlin who has brought it with him to this country to try it first on a large scale on our people. The publicity given it and him has attracted the attention of tuberculous patients all over the country, and many of them have flocked to New York in the hope to get the opportunity to see him, and so many of them crowded to his hotel that he had to be asked to give up his room. The hotel proprietors objected to the large numbers of consumptives who had to be excluded from their corridors or the hotel guests would feel uncomfortable. Physicians in New York City and many others, particularly clergymen, have received many requests by mail from the friends of tuberculous patients at a distance asking them to secure a special opportunity for these patients to take the new "cure."

A foreigner unacquainted with American sensational modes of publicity would be almost sure to conclude that there was no doubt that a wonderful discovery in medicine had been made and that there was only question now of finding ways and means of applying it so as to prevent the ravages of the most serious scourge of disease from which mankind suffers. There have been, of course, some doubts exprest as to the possible efficacy of the new cure, but as these have come from physicians, apparently the general conclusion has been that they are due to the professional jealousy of those who hate to see a rival colleague succeed where they have failed and who foresee that their practice in tuberculosis is about to disappear under the magical effect of this new "cure" and who therefore quite naturally resent it.

Under these circumstances it is interesting to ask, what is known with regard to this much advertised cure. There are some who think that it is unfair to refer to the opinion of his German colleagues because, as the discoverer held no official position of any significance in university or hospital life in Berlin, it would be only natural to expect that his German confrères would fail to appreciate properly any discovery that he might make, since of course discoveries in official-ridden Germany, to be recognized, must come thru official channels. Perhaps it may not be unfair, however, to refer to English medical opinion in the matter. It has often been said that when German and French medical scientists differ with regard to a subject, the English balance of opinion is a most valuable corrective. In the present case a special investigation of this new cure has been made by the London *Lancet*. The *Lancet* is probably the best medical journal in the world. It has been conducted for a century now on thoroly conservative yet eminently progressive lines, and has been independent of all sorts of influences and has made its investigations of new remedies and modes of treatment for itself, even at great expense. Some three months ago the *Lancet* made an investigation of this new cure and here is what was said:

We are sure that our readers, many of whom for the past three weeks must have been bombarded with requests for information on the subject, will be well advised to state in the clearest possible terms that no 'cure' has been discovered; and they can go further and state that no real advance in therapeutics has been made. This is not to say that there is no possible support for future therapeutic developments to be derived from what Dr. Friedmann has discovered, tho it must be remembered that we do not know exactly what it is that he has discovered; but at the present moment the only possible attitude for the medical profession to adopt is that of willingness to receive with interest any further information which he may have to supply and

any further and better evidence which he can bring forward. We can only believe, having regard to the wide publicity which Dr. Friedmann's 'cure' has received, that he has been the victim of ill-informed and credulous reporters, so that an incomplete and as yet totally unverified therapeutic departure has been published broadcast in the daily papers of the European continent as a conclusive scientific discovery.

His German colleagues are quite amused over the fact that we should have made such a fuss over Dr. Friedmann here in America, and one of them has written to say that Dr. Cook at Copenhagen is as nothing to Dr. Friedmann in New York. He has been given abundant opportunity in Germany, and no one has ever seen any improvement of cases treated by him. He has two or three show cases over a year old, the only history of which available is that their mothers declare that the children have been under the treatment of other physicians who had done them no good, but Dr. Friedmann cured them. Evidence of that kind could be procured for any and every kind of remedy. What has surprised physicians who have investigated Friedmann's methods abroad is his meager case histories and the lack of scientific records of his cases. He has refused to reveal the secret of his treatment, and he withdrew the offer to submit the treatment to his own Government.

The *Journal of the American Medical Association,* the best scientific medical journal in America, says with regard to the new "cure": "The public and the profession alike may be pardoned for remembering that a patent was applied for and the treatment advertised before its value was establisht; that as yet we have the word of no one who has actually tested it except Dr. Friedmann and his assistants or associates; and, finally, that, altho there is no lack of clinical material in Germany, he has chosen to bring it to America first from no other apparent motive than pure commercialism"; and adds:

> It appears, moreover, that the newspapers which have hastily assumed that Dr. Friedmann is being unjustly treated have missed an important point—indeed, *the* important point in the whole matter: What about justice to the public? Would it be fair or just to the throngs of tuberculosis sufferers, excited by hope of a 'sure cure,' to facilitate their unlimited experimentation and exploitation by an unknown and perhaps dangerous method? It would not; and justice to the public, while not incompatible with justice to Dr. Friedmann, is, after all, the paramount consideration.

Here are authoritative declarations on the subject from sources with knowledge and the right to make them. Of course, for evidence for the success of a "cure" for tuberculosis, not days or weeks or even months, but at least a year is necessary. It took over a year to decide Koch's failure. Let the tests, under proper government control, go on then, but until we know more let us keep poor consumptives from having hopes raised that seem surely doomed to disappointment.

Pass It Along!

Has it ever occurred to you, satisfied reader, that there is another who would bless you if you were to send your read copy of THE INDEPENDENT to him or her?

There is such a one, and if you will stop to think you will know just who he is. Possibly he may not be able to buy THE INDEPENDENT or perhaps he is not conscious of the need. In either case your gift will be welcome.

This is the best use that can be made of good periodicals. In many households the read periodicals become a nuisance, they accumulate so rapidly. They should not be allowed to accumulate. If it is thought that there are so many magazines that every person must have one or more, such a conclusion is an error. There are thousands of people in every large city who are hungering for good reading matter, and hundreds or scores in every town and hamlet. There are organizations and people who make it their business to collect and distribute read magazines and books to many classes of deserving readers.

But the gift is in the giving. It is the better way to select some person to receive THE INDEPENDENT, some one to have *The Century,* some other one to get the *Review of Reviews,* and so on, and thus make the matter one of personal contact. We are concerned only about THE INDEPENDENT, and we wish to feel

that the readers who know it and like it and are benefited by it have a spirit of helpfulness so well developed as to respond to this suggestion, if indeed they are not already sending THE INDEPENDENT to some one.

Our Isthmian Canal Options

The last days of the Taft Administration were distinguisht by two great diplomatic undertakings, the drafting of a treaty with Nicaragua and the negotiation of a settlement of the controversy with Colombia. The first failed thru the neglect of the Senate to ratify the agreement; the second thru the refusal of the Colombian Government to accept our very generous offer. The failure of both is much to be regretted on all accounts, for the first settlement would have given us an option on the Nicaragua canal route and would have placed that backward country on the high road to prosperity, while the second would have given us an option on the Atrato canal route and satisfied all of the financial claims of Colombia arising from the secession of Panama.

The first provided for the payment of $3,000,000 to Nicaragua, to be spent on internal improvements; in return for this we secured the exclusive right for ninety-nine years to construct an interoceanic canal thru Nicaraguan territory, and we also obtained a coaling station on the Gulf of Fonseca. This treaty was passed by the Nicaraguan National Assembly on February 26, but was pigeonholed by the Foreign Relations Committee of the United States Senate. It should be dug out and passed promptly, for it gives us control of one of the few good harbors on the Pacific coast and secures us from the competition of a rival canal. Such competition is not so impossible as some Senators believe, for the cost of a canal thru Lake Nicaragua was estimated by our own engineers at $118,113,790; that is, less than a third of what the Panama Canal is costing us. Of course, the plan would now have to be enlarged somewhat, the 800-foot locks would have to be extended to accommodate 1000-foot ships, etc., but improvements in machinery for excavating and for handling concrete may be expected to bring down the cost of construction enough to compensate, so it may be anticipated that Great Britain or Germany could some time in the course of a century put thru a Nicaraguan canal which could make money with tolls a third of what we must charge at Panama.

It should be remembered that we would have had Fonseca and the Nicaragua canal rights sixty-four years ago if it had not been for the opposition of the Democratic majority in the Senate. Tiger Island, in the Gulf of Fonseca, had already been ceded to us when, on October 15, 1849, a British fleet sailed in and took possession of the island. Our agent, Mr. Squiers, ordered the British off within a week, but they did not go, and Secretary Clayton, lacking the support of the Senate, was obliged to conclude the humiliating Clayton-Bulwer treaty, which has been an embarrassment to us ever since and which was the cause of the present dissension between Great Britain and the United States. Great Britain is just now particularly indulgent toward us on account of her fear of Germany, so now is the time to secure the rights in Nicaragua that we formerly forfeited.

While the treaty with Nicaragua would have protected the Panama Canal from competition to the north, the treaty which Secretary Knox vainly tried to negotiate with Colombia would have secured us against any rival route to the south by giving us an option for seventy-five years over the Atrato River route. This route was advocated as early as the seventeenth century, but Philip II, the bigoted King of Spain, who regarded canal digging as an impious attempt to undo the work of the Creator, forbade any one, on pain of death, to connect the Atrato River with the Pacific Ocean. Nobody so far has disobeyed this edict, but they may do it some time, for the surveys that have been made of the Atrato route have hardly been thoro enough to prove it impracticable.

But doubtless the $10,000,000 which in February we offered to Colombia for this option and for coaling stations on the islands of St. Andreas and Providencia was less for the purpose of securing a commercial advantage to ourselves

than of soothing the feelings of Colombia for the loss of Panama. Whatever may be thought of the part we played in the Panaman revolution, nobody can henceforth accuse us of an unwillingness to make generous compensation. Our Minister to Bogota offered to submit to arbitration all the financial claims which the Colombian Government could bring, tho this might have amounted to $97,446,000, including the $10,000,000 for the option. This is nearly ten times the amount we offered Colombia in 1903 for the privilege of digging a ditch thru her land, which President Marroquin repudiated after he had accepted.

What more can we do than to offer to submit to impartial arbitrators all the pecuniary claims of Colombia? What's done is done and can't be undone, and we are very glad of it. We certainly will never consent to thrust back the Panamans under the tyranny of the Bogota politicians against whom they rightfully revolted. They had better cause to throw off their allegiance to the Colombian Government than we had to rebel against George III, and we shall see to it that they do not lose the freedom and prosperity that they have gained.

England's Peace Challenge

When the Czar called together the first Hague Conference his chief hope was that the overgrowing and evergrowing armaments that were impoverishing the peoples of the world might in some way be taken off their backs. The question of the limitation of armaments, accordingly, was the "frontispiece" of the circular of the Russian Government and the Russian delegation strained every nerve to have the conference take some action in the matter. All the conference would do, however, was to pass a resolution that "the restriction of military charges, which are at present a heavy burden on the world, is extremely desirable," adding the pious wish (*voeu*) that the governments should "examine the possibility of an agreement as to the limitation of armed forces by land and sea and of war budgets."

In the interval between the first and second Hague conferences the governments paid no attention to these suggestions, but went ahead increasing their armaments at a rate and on a scale hitherto unprecedented.

The only two utterances by responsible heads of states against this military aggrandizement that we recall were made by the British Prime Minister, Sir Henry Campbell-Bannerman, at a speech in Albert Hall, London, in 1905, and by President Roosevelt to the American Peace Congress in New York in 1907.

England and the United States accordingly "reserved the right" to bring up the discussion of the limitation of armaments at the second Hague Conference, especially as Russia had abandoned her championship of the cause and was proposing to bar it out of the discussion. Not, however, until after the conference was in session over eight weeks was the subject introduced. Then England made the following tentative proposition, altho Germany, Austria, Russia and Japan had announced that they would not share in the discussion:

> The Government of Great Britain will be ready to communicate each year to the Powers that will do the same, its plan of constructing new warships and the expenditures which this plan will require. Such an exchange of information will facilitate an exchange of views between the governments on the reductions which by common agreement may be effected. The Britannic Government believes that in this way an understanding may be reached on the expenditures which the States that agree to pursue this course will be justified in entering upon their budgets.

After Mr. Choate in behalf of the American delegation had "exprest his sympathy for the views which have been stated by His Excellency the First Delegate of the British Delegation," the discussion was solemnly dropt and the whole question was tabled again in the following resolution:

> The Second Peace Conference confirms the resolution adopted by the Conference of 1899 in regard to the limitation of military expenditures; and inasmuch as military expenditure has considerably increased in almost every country since that time, the Conference declares that it is eminently desirable that the governments should resume the serious examination of this question.

Here the matter rested until last week, when Winston Churchill, the First Lord of the British Admiralty, in sub-

mitting the naval estimates for the year to the House of Commons, made the proposal that the nations cease building battleships for a year. "It is no appeal of weakness or lagging that we make," he said, "but rather an appeal of strength. It is an appeal which we address to all nations, and to no nation with more profound sincerity than to our great neighbor over the North Sea." This is a remarkable utterance and most creditable to England.

How will the nations take it? Altho Germany is sneering, as was to be expected, and some of the other Powers are maintaining a polite silence, the United States could well afford to accept England's offer. Happily at the present moment our State Department enjoys the services of a Secretary and Assistant Secretary whose devotion to the cause of peace is beyond question. Probably never before has a new administration begun its labors better equipped to work for peace than President Wilson's. Secretary Bryan and his counsellor, John Bassett Moore, are already committed to the most advanced peace ideas, and we may confidently expect from them much toward the carrying out of peace proposals in the next few years.

Could any illustration of the folly of armament emulation be finer than this passage from Mr. Bryan's address at Lake Mohonk three years ago:

> Suppose there was a large lake, and suppose that there were half a dozen landowners, with their lands bordering on this lake, living peaceably together, without trouble or sign of trouble. A man who builds ships goes to one of them and says: "You are very foolish: you are living here with no protection whatever. Don't you know that any of these men around you might build a battleship and come here, and you are absolutely defenseless? Now let me build a ship for you, and you will get ahead of them." Suppose the man was foolish enough to take the advice. Just as soon as that ship was built, the shipbuilder would go to the next neighbor, and say. "Why, don't you see that man over there has got a battleship? What has he got that for? Do you suppose he is building it for nothing? Have you any doubt he has designs on you? Where else can he use it except on this lake? You had better get ready. Now I can build you two." And, if this man is foolish, he would build two. Then what an argument the shipbuilder would have when he got to the third man! "Why, there are two of them against you. They might combine, and you are absolutely defenseless." Now with that argument he could go all 'round that lake, and, after building ships for each one, he could go back to the first one, and say: "You are out of date. Look at the improvements since you built. And then you have only one, and these other people have four or five or eight apiece. There is nothing for you to do but mortgage your land. Now you are in for it!" Now that is the race of the world, my friends—that is the mad race of the world.

Let our State Department, then, accept Winston Churchill's offer. It is fitting for England and the United States to stand shoulder to shoulder in the greatest of all wars—the war on war.

Save the Cat

A lover of cats makes a new plea for them. He tells us that cats kill the field mice which rob the nests of bumble-bees, and the bumble-bees fertilize the blossoms of the clover, which feeds the cows that give us milk. Such is the chain of nature that the loss of any link may do grave damage. This is the way of it:

This is the babe that mother loved.

This is the milk that nourished the babe that mother loved.

This is the cow that gave the milk that nourished the babe that mother loved.

This is the clover that fed the cow that gave the milk that nourished the babe that mother loved.

This is the bee that saved the clover that fed the cow that gave the milk that nourished the babe that mother loved.

This is the mouse that killed the bee that saved the clover that fed the cow that gave the milk that nourished the babe that mother loved.

This is the cat that ate the mouse that killed the bee that saved the clover that fed the cow that gave the milk that nourished the babe that mother loved.

Therefore will mother protect the cat or she will incur a dearer loss than that of the malt in the house that Jack built.

For the Vacation Number

Our readers are providing us with some of the material which will, we hope, make our 1913 Vacation Number the best in the history of THE INDE-

PENDENT. From east and west, from Texas and Tennessee and Saskatchewan, have come envelopes and packets enclosing letters, short articles and photographs.

Those of you who have not already sent in an account of some vacation, enjoyable or unusual, are urged to act *now*. A long article is not desired; only a short and snappy hint of pleasures tasted, travels taken, lessons learned out of school time. Perhaps recess is, indeed, the best part of our schooling. It is then that the pupil is really tested.

One annual delight of the Vacation Editor is the fact that he hears from INDEPENDENT readers of all ages. No one is too young, no one too old, to enter this friendly competition. Besides the announced cash prizes, there are, remember, two free annual subscriptions to the magazine for each writer whose manuscript is published in our issue of June 5, but who does not win one of the prizes. And the case is the same for those who send in photographs or drawings in the art contest. Here we want above all pictures of vacational interest, pictures taken out of doors. The vacation manuscripts which we invite should, if possible, be illustrated—whether by the camera or by drawings in line or in wash. But in the special picture contest, where the picture is unaccompanied by an article, TREES are the special subject suggested, just as water was last year's theme.

If you want your offering or offerings (for you may send any number) returned in the event of their proving unavailable, please send postage stamps with them. And don't forget to give your name and address! In the case of illustrations, an account of the subject should be written on the back of the photograph or drawing. This description cannot be too full to please us. And *don't* put off sending in your contributions. The Vacation Editor plans to leave New York on April 15—with a trunk. That trunk will contain the contributions which you offer him; he will read them in the calm of the countryside, under a big purple beech. Thus will he put himself in tune with the Vacation Number, but if your good article, your alluring pictures, have not arrived by then, how can he read them, or accept them, or award them prizes?

The Vacation Editor sets no limits, urges no limitations. For that very reason he hesitates to offer suggestions, even. But here are some of the questions that you may properly answer: What do you like to do in vacation time? Or why do you like it? What do you like to read in vacation and where? What was the happiest day in your 1912 vacation? Whom did you in your turn make happy while you were enjoying your own rest, last year? But, since all are not summer vacations, those persons who are fortunate enough to find time for holidays in autumn or spring or winter are sure to make an interesting tale of that.

From three to six hundred words is the preferred length for articles. In the case of photographs glossy prints are the best for reproduction. Humor and good nature and freedom from literary artifice—these and the notes of personality and the place-spirit are favorite qualities of ours in this kind of writing, and contributing to the Vacation Number will make you free of the noble company of the initiated INDEPENDENT.

The Program of the Liberals

Four great schemes of reform are now being put forward by the English Liberal party! These are electoral reform, educational reform, the reform of the English land system and the reform of the House of Lords. There is little likelihood that any one of these four reforms will become law during the present session, or indeed during the lifetime of the present Parliament, whose term will expire by lapse of time in 1915. English Parliaments for the last fifty years have never been continued to the full legal limit of their existence—seven years from 1716 to 1911, and five years since the passage of the Parliament Act—and the general election is almost certain to come before the end of 1915.

Electoral reform—including the abolition of plural voting, the simplification of registration and a considerable extension of the franchise to include some two million more men—is strongly desired by the Liberals, but any legislation

on this subject is impossible without raising the apparently insoluble problem of woman suffrage. Educational reform was one of the most discussed questions of the election of 1906 which brought the Liberals into power; but after Mr. Birrell, Mr. McKenna and Mr. Runciman, the successive presidents of the Board of Education in the years from 1906 to 1908, had each failed in his attempt to pass an education bill thru Parliament, the reform of national education was allowed to drop, and other subjects—the Budget of 1909 and the Lords' Veto, Irish Home Rule and Welsh Disestablishment—occupied the public mind.

The ideal for the coming educational reform was voiced by Lord Haldane, the Lord Chancellor, on January 10, when he announced that the Liberal party must "secure equality of educational opportunity for the son of the poor man and the son of the rich man," and that an end must be put to the "condition of chaos and confusion that now exists in the educational world of Great Britain." The reform of the land system was begun by the taxation of land in the Budget of 1909, and is being furthered by the work of a commission which at the present time is investigating the whole question of the land, its tenure and its taxation. As for the reform of the House of Lords, the chief object of Mr. Asquith's recent statement concerning the abolition of the hereditary principle was to bring the subject before the people, and to begin the education of public opinion to demand drastic reform of the House of Lords at the next general election. It would be impossible for the present Parliament to deal effectively with a question of such far-reaching constitutional importance in the last two years of its existence.

In Brief

For the first time in the history of international relations, the United States will act as host to the young scholars of the world this fall, when the Eighth International Congress of Students will take place under the auspices of the Association of Cosmopolitan Clubs in its capacity of American member of the *Fédération Internationale des Etudiants "Corda Fratres."* The official sessions will be held at Cornell University, Ithaca, N. Y., September 3-7, the Cornell Cosmopolitan Club providing for the proper reception and accommodation of the visitors. In addition, a comprehensive itinerary has been worked out for the entertainment of the foreign delegates, beginning with their arrival at Boston on or about Auust 27 and ending with their departure from New York, September 16. This itinerary will include visits to Boston and Harvard University; a daylight trip on the Hudson, from New York to Albany; a reception at the Capitol of the Empire State by Governor Sulzer; an excursion to Niagara Falls; an inspection of the University, the United States Mint, and the historic sites of Philadelphia; a stay of several days at Washington, with a reception in the Hall of the Americas by the officers of the Pan-American Union; and a final reunion at New York, with a banquet by the New York Peace Society. Any organization that has for its aim the promotion of friendship between students from different countries is cordially invited to send delegates.

Just when the British Ministry were triumphantly anticipating the support of Parliament and the country in carrying out its measures for Irish home rule and Welsh disestablishment there comes this miserable personal attack on the honor of the Attorney General and Mr. Lloyd-George. The Government had made a contract with the British Marconi Company for a series of installations all over the British possessions, and now it is charged that they have purchased stock largely for speculative purposes in the American Marconi Company. Besides, Mr. Lloyd-George wrote a letter of congratulation to a Marconi dinner in New York. Nobody really believes there was any corrupt purpose in these acts, but the most is made of it, for the Opposition must use all means to defeat the Liberal Government.

Many will regret that John R. Mott has declined President Wilson's offer of the Ambassadorship at Peking. His reason for declining it may be presumed is that he is engaged in a great work and cannot come down; that is, that he regards his religious work as more important than diplomatic work, watching Russia and Japan, and helping American concessionnaires. It may be that there would have been objection to the appointment on the part of Catholic supporters of the Administration, of one who is known chiefly as interested in Protestant missions, when there are many more Catholic Christians in China than Protestants. But it is true that American Catho-

lics have no missionaries and no Association work in China, while Protestants are strongly represented there.

We have in this city two principal associations which have for their object the relief of poverty, one the Russell Sage Foundation, and the other the Association for Improving the Condition of the Poor. The latter society, of which Mr. R. Fulton Cutting is president, rejoices in the gift of $650,000 from Mrs. Elizabeth Milbank Anderson as a fund to extend its work. Very properly the association will not use the income at all for individual relief, but wholly for preventive and constructive work for the removal of the causes of poverty, particularly in New York. This fund thus creates a department of social welfare. The particular directions which Mrs. Anderson specifies for effort are health, children and food supply. It is an open field for this generous gift.

Mr. Anson Phelps Stokes makes a happy suggestion in *Harper's Weekly* to reduce the evil of what is called the "pork barrel." He would have it made a rule by the Appropriations Committee of the House not to accept any appeals for appropriations that concern only a local community unless accompanied by the pledge to pay one-tenth of the cost. Thus if a town wants a particularly fine post office building let it give part of its cost, enough to feel a pride and ownership in it. That is democratic, and it will give some assurance that the building is needed, and it will also conduce to economy by barring out cases of real robbery.

What is a high school? We have observed that in many parts of the South the addition of an extra year to a grammar school credits it with the name of high school. It is therefore pleasant to learn that the Association of Colleges and Secondary Schools of the Southern States is making an accredited list of high schools in order to stimulate the high schools to maintain high standards. It is intended that the "Southern List" shall be an honor list of schools for the entire section.

We do not ask for an increase in the salaries of Ambassadors and Ministers representing the United States in foreign countries. The salary is large enough. We do not want as lavish display as several Ambassadors have made during the last few years. But they should have creditable residences, and a moderate sum allowed for entertainments. We do not need to search for men that will set the pace in extravagance.

What could be more inhuman and un-Christian than the notification to its employees by a big banking concern in this city that they must not marry on less than $100 a month under peril of dismissal and loss of a share in the company's pension fund? But it is matched by a story of a club of college girls who agree not to marry for five years after graduation, and then only men with $5000 income.

In Hartford, Conn., the tolerated houses of vice have all been closed since December 29. This is substantiated by the detectives of the Hartford Vice Commission, and also by reports from the constituted authorities. The crusade must go on. Other New England cities which claim entire suppression are Fall River, Lowell, Worcester and New Bedford.

When last week Colonel Baldwin, head of Mr. Roosevelt's new party, wanted to take to his room at the hotel two leaders of the colored contingent, the management would not allow them to go up and down by the usual elevator and required them to take the elevator reserved for servants. Colonel Baldwin did not like it, but submitted.

When we think of Dayton covered deep with water it is pleasant to remember that 1700 children in Dayton tilled backyard gardens, each 10 by 25 feet, last year, under the supervision of the Dayton Parks and Playgrounds Association, and not only provided fresh vegetables for home use, but in many cases sold the produce for enough to buy textbooks and other school supplies.

What a difference between the condition of Porto Rico and that of Cuba or Mexico. The Porto Rican Legislature has just adjourned, and the chief bills past have to do with children and women's labor, employers' liability laws, the construction of roads, and taxes on liquor and cigars, just such as belong to a period of tranquillity.

What an army is good for, whether the regular army or the militia, we are learning just now when the soldiers are called on to protect the residents of cities devastated by floods. An army to save life is in more honorable business than when engaged in destroying it.

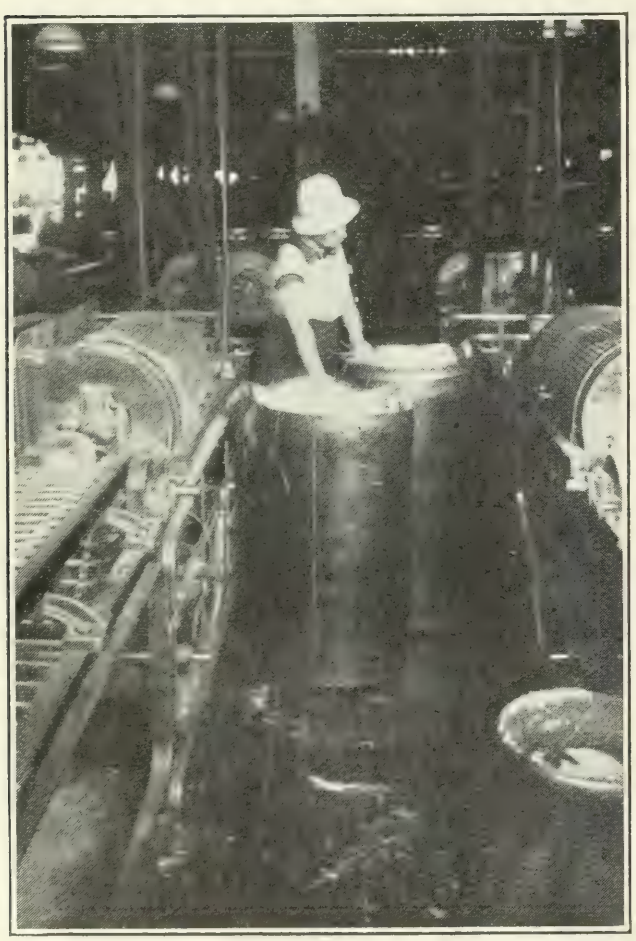
The simply horrible murder, by the brother-in-law of President Huerta, of a distinguished prisoner, excites indignation and more fear for Mexico. A united Mexico under the present government is too much to hope for.

Working Conditions in Factories

By Abram I. Elkus, LL.B.

[In our issue of February 20, we discussed at some length the very able and thoro report of the New York State Factory Investigating Commission which is now receiving such wide comment thruout the country. This week we are pleased to present to our readers a fuller discussion of factory conditions in the State from the chief counsel of the commission. Mr. Elkus has long been known as one of the ablest and most public spirited lawyers in New York. He is counsel for the Merchants' Association, has been special United States Attorney to prosecute fraudulent bankruptcies, is a trustee of the Baron de Hirsch Fund, president of the Hebrew Technical School for Girls, regent of the University of the State of New York and a delegate to the recent Democratic Convention in Baltimore. He is also the author of several treatises on legal subjects and a member of many clubs. The saddening disclosures he makes in the following article could doubtless be duplicated in many other States were the factory conditions investigated.—EDITOR.]

There are in the State of New York about 45,000 factories, in which 1,250,000 workers are employed. Of these, 14,000 are children between the ages of fourteen and sixteen. To devise means whereby the lives of this army of men, women and children shall be protected against fire, accidents and industrial diseases; whereby their health and safety may be promoted thru proper ventilation and sanitation; whereby the excessive toil of women, both in factories and in tenements which have been made the adjuncts of factories, shall be prevented; and finally, whereby the employment of little children in work done *for* a factory or *in connection with* a factory shall be prohibited—this has been made the subject of careful and scientific study by the New York State Factory Investigating Commission, and this is fully covered in the bills recommended by that commission and now before the State Legislature. The proposed legislation is by no means radical or unusual. If enacted it will merely put New York on a level, in this respect, with many other states of the Union and with the most enlightened nations of Europe.



Created in response to a popular demand for an investigation of the Triangle fire, in March, 1911, the Factory Commission has devoted much time to an investigation of the fire problem, both in New York City and in other cities of the State.

Many causes contribute to the horror of a factory fire. But the most frequent cause is congestion. The workers are crowded together, back to back, as closely as the floor space will permit. In the Triangle workrooms, for instance, the sewing machines were fastened to long tables, one of them 75 feet in length, with two narrow openings at the two ends. After the fire twenty bodies were found back of this table, showing that these workers had not had time even to reach the aisles. No doubt there was delay in spreading the knowledge of the fire to the upper stories, so the commission recommends fire alarms; no doubt automatic sprinklers would have checked the fire at its beginning; so the commission recommends the installation of automatic sprinklers in some factories; but the real reason why 143 persons lost their lives at the Triangle fire was the congested state of the workrooms. *Too many people were here.* One of the most important recommendations of the commission, if not *the* most important, therefore, is that the number of occupants in any factory shall be limited to the capacity of the stairways and exits.

Another change—and a very simple one—recommended by the commission is that doors shall open outward. In almost every large fire—and the Triangle fire was no exception—we read of frantic people hurling themselves or being pushed by those behind them against doors that open inward, every effort closing more surely the way to safety. Doors, too, should be wide. The stairways themselves should be wide—not less than 44 inches in factory buildings hereafter erected. They should be straight, and, above all, separated from the rest of the building by fireproof partitions. In new buildings, all vertical openings must be so separated. But in its recommendations for buildings already standing, the commission has restricted itself to minimum requirements. Its first object was to protect the lives of the workers. It has endeavored to accomplish this object, however, without increasing unduly the bur-

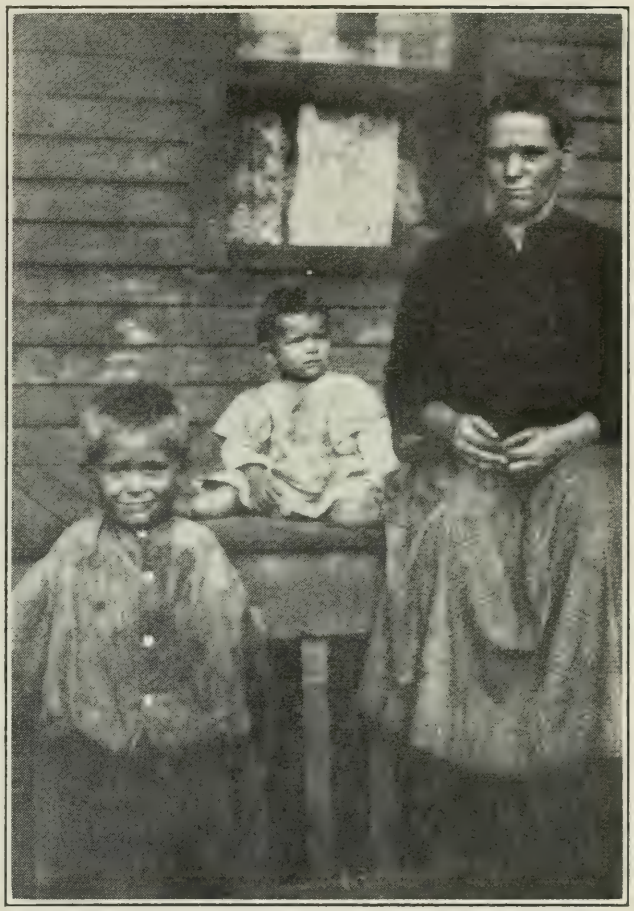
dens of the manufacturer who owns or rents the building.

Altho the factory be properly constructed, altho congestion be prevented by limiting the number of occupants to the capacity of the exits, if the workrooms are not kept clean there will still be disastrous fires. In many workrooms the floors are strewn with scraps and cuttings and soaked with oil from the machines. Raw materials or finished products are stacked, temporarily, in the workrooms. The gas-jets are unprotected, and perhaps the foreman lights his pipe there during working hours. So the fire, started by a chance spark, licks its way thru all this combustible material and gets beyond control. The manufacturers must have their workrooms made clean and kept clean. Small wonder that our property losses by fire are eight times as great as those of Europe; small wonder that in New York City alone the loss of life by fire averages one life for every day in the year; when workers are crowded together in factories like bees in a hive and the places where they work are cluttered and smeared with fire-feeding materials! And the remedy is so simple! As the command came in Jerusalem of old, "Let every man sweep his own doorsill."

HEAVY WORK FOR SLENDER ARMS
These hampers full of hemp are handled by women workers in spite of the investigator's protest.

Next to fires, accidents are the most tangible agents of maiming and destruction in factories. There were 50,752 accidents in one year for factories alone reported to the State Department of Labor. Of these 167 resulted in death and the rest were of a more or less serious nature, involving loss of time and often permanent injury. Besides, it must be remembered that there are scores of accidents in factories every year which are never reported to the Department of Labor.

Many factory accidents result from exposed machinery, from unguarded elevator shafts, from the inadequate lighting of passageways; many, too, from ignorance or carelessness on the part of the workers. In a caustic potash manufactory, for instance, visited by the commission, the liquid caustic was being sent thru sections of a shallow iron trough. These sections were suported by several wooden blocks at the junctions. Workmen frequently pased under the trough, in the dim light, without any thought, apparently, that to dislodge one of these blocks might mean instant death by the downpour of the burning liquid. When the foreman was asked why he permitted this, he answered with a shrug, "They know it's dangerous." And so he made no effort to stop them.



More insidious and slower than accidents, but no less deadly, are the various forms of industrial poisoning and disease. Here again the indifference of employers and, it must be added, the ignorance and carelessness of workers, take their dreadful tally of human life. Repeatedly the commission's inspectors found men handling paris green and carbonate of lead with as little thought as they would have handled sand or flour. In one plant that manufactured paris green, workers were found handling and packing the poisonous stuff without respirators, some even without gloves. In a large lead battery plant most of the workers were seen handling the lead without gloves or other protection from

the dust. There was no hot water for washing the hands and no lunchroom. Also, one of the pots in which lead was being heated was without any hood and discharged its poisonous fumes into the workroom. Many cases of acute and chronic lead poisoning were traced to this plant by the commission's investigators.

Furthermore, in foundries, in chemical factories, and other factories as well, the glare and heat from the furnaces are often well nigh intolerable. In one chemical factory the temperature near the furnace was said by the superintendent to be between 120° and 140° F., and the heat and glare were so overpowering that the men had to kneel and stoop and shield their eyes in order to go on with their work. Exposure to sudden drafts while in such a heated condition predisposes the worker to consumption; nor is it surprising that insurance statistics show excessive mortality from this disease among foundry workers.

In addition to certain obvious safeguards and requirements recommended by the commission in regard to accident prevention and the like, as well as ventilation and general sanitation, the main reliance of the commission is placed on what might be called a "campaign of education" for employer and employee alike. This campaign is to be far-reaching and permanent. It is to consist of lectures by experts connected with the Department of Labor, of bulletins and reports published from time to time by the department, and inspection by men of training and experience who shall be able to advise with the employer as to the surest and least expensive way to remedy an evil, and to show workers on the spot what they must not do and why.

It would be unfair to the large number of enlightened employers thruout the State not to say that in many factories conditions are all that could be desired. These employers have installed ventilating systems at a cost of thousands of dollars, they have provided dressing-rooms for women workers, ample washing facilities, and the like. Again and again testimony was given before the commission as to the wisdom of such a course, even from the standpoint of dollars and cents. Increased efficiency on the part of the workers means increased business prosperity. For employers of a different class, however, employers who look upon their workmen as machines to be worn out and then cast aside as useless—for there are such—these men must be made to see the light. The state cannot afford to waste its most valuable asset—the life, the health, the well-being of its people.

AT TWENTY-FIVE SHE SEEMS FORTY-FIVE
This mother works all night willingly for the sake of her children.

If the condition of men in some of the factories of the state is bad, that of women is appalling. To be sure, there is a law in this state limiting the hours a woman may work in a factory to ten hours a day and fifty-four hours a week. But the good effects of this law (even if it were enforced) are minimized by a number of factors. In the first place there is no legal closing hour, in consequence of which women are compelled to work far into the night, in extreme cases the whole night. In one bindery establishment in New York City a woman worked for twenty-four and one-quarter consecutive hours—in two calendar days. Again, there is no provision by law for

one day's rest in seven. Even putting the Decalog aside—and some of us are old-fashioned enough to believe that it is still in force—the health of the workers demands this break in the week's work. Department stores—which, by the way, the commission recommends be brought under the factory law—are great sinners in this respect. Especially is this true during the "rush" weeks before Christmas. Not only do the saleswomen and others work excessive overtime hours during the week, but they are required to be in the store on Sunday as well, for from three to eight hours. In some cases this Sunday work is confined to two or three of the Sundays before Christmas. In one case, last Christmas, a girl worked for thirty-five days without a break.

Once more, the practice of many manufacturers in giving out work to be done or finished at home nullifies the fifty-four hour law. Women work at carding buttons, willowing plumes, crocheting lace, when they are worn out, when they have consumption, when their children are dying. They "need the money most then." Little children are drafted into the work before school and after school and on Sundays. A number of cases are reported of very young girls turning to a life of prostitution because they were "tired of work"—tired of the constant grind of the factory before ever they had reached the legal age to work in a factory.

Finally, the fruit and vegetable canners in the rural parts of this state work women excessive hours during the "rush season." They also employ little children to work in the cannery sheds snipping beans and husking corn. Both of these things are necessary, they claim, on account of the perishable nature of the crops. In the thirty-three canneries inspected by the commission last summer, 1355 children under sixteen years of age were employed, 96 in the factories proper and 1259 in the cannery sheds. Of the shed workers, 942 were under fourteen years of age, and 141 under ten years. There was one baby of three. They were kept at work by their parents (mostly Poles or Italians) day and evening, till they lost all spirit of play and sat on their boxes like little machines, snipping, snipping, with their sore fingers tied up in rags. Their wages rarely exceed $2 a week.

The wages of the women workers in canneries average $4.53 a week, from 7 to 10 cents an hour. No woman could maintain herself on such a wage. It is true that in most cases father, mother and children all contribute their share to the family budget. But there are also a number of young girls working alone. It is not surprising, therefore, that a "working investigator" for the commission speaks of a timekeeper who offered to put her in the way of making "two or three dollars any time" if she would take a "stroll" with him.

Moreover it is not true, as the canners claim, that fatigue caused by excessive work during the "rush season" can be offset by periods of comparative rest when work is slack. Women cannot toil for ninety or a hundred hours during consecutive weeks without lasting injury. Besides, during a busy season the women are not properly nourished, for, in addition to their work at the cannery, they must care for their husbands and children and do whatever washing and cooking is done. One woman told an inspector that she was "starved for cooked food," and that if they did not have to work the next Sunday she was "going to cook and eat all day."

"What we know as men we cannot profess to be ignorant of as judges," said the Court in a famous case which involved the limitation of working hours for women. This remark of the learned judge is the sublimation of common sense. It is supported by the formal decisions of other courts, and it voices the current of enlightened public opinion, at this time when public opinion is being studied by judges, administrators and lawmakers in every state and in the capital of the nation. The health and strength of women working for excessive hours in factories must suffer. And not only does the health of the women suffer, but the health of their children, as is shown by the fact that in such factory towns as Lowell, Mass., the death rate of infants is extremely high. Even if these children outlive infancy, they are weak and puny and fall an easy prey to disease and death. The exploitation of children is a reproach to the state that allows it.

The exploitation of women is a crime against the race, a crime which brings its own punishment in the multiplication of weaklings, degenerates and criminals.

All the recommendations of the commission, however, for the improvement of working conditions in factories are fragmentary and incomplete by themselves; just as a man may gain much knowledge of geography, of history, of rhetoric and of grammar without its ever crystallizing into an education. The crystallization of the commission's work is in the reorganization of the State Labor Department. Here all the separate recommendations of the commission are consolidated. Here they take shape and meaning. These separate recommendations for safeguarding the lives of workers against fire, for preventing accidents, for limiting the hours that women may work in a factory or for a factory; all of these are paralleled in other states. But the reorganization of the Labor Department is creative legislation. As reorganized, the Labor Department ceases to be a mere police department and becomes a department of education. One of its most important branches is the Industrial Board, a permanent legislative body with the Commissioner of Labor at its head and four associate members, chosen by the Governor of the State and serving a term of four years. The Industrial Board has power, under broad general statutes, to make rules and regulations that shall meet the ever changing conditions of industry.

For instance, it shall have power to fix standards of ventilation, temperature and humidity, to be applied to different industries under different conditions. Each member of the board also has the power to make personal inspections of all places affected by the Labor Law. In a word, the commission has not only made recommendations for the improvement of working conditions, but has provided in a reorganized Labor Department, and above all, in the Industrial Board, the necessary machinery whereby those recommendations may be carried into effect.

New York City.

The First Worm

(Worma Virumque Cano.—Virgil)

By William J. Long

This morning, as I went to work,
(For work I was not wishing)
A worm crawled briskly out and said:
"Come on, let's go a-fishing!"

I wonder how that worm knew me,
My thoughts, my inmost wishes,
Which ran, not slow to tasks, but swift
To brooks and little fishes.

Instead of toil and noisy streets,
Sad heart and anxious feeling,
There came a haze of golden dreams
With blessing on me stealing.

I felt the warm rich tide of spring
Mount in me with elation;
I heard the call of earth and sky,
The red-gods' invitation.

I saw the lights, the wimpled gleams
Of amber waters flowing;
I smelled the fragrance of the woods,
With birch and spice-buds blowing.

I heard the wind's low symphonies,
The partridge drum-call rolling;
In every hidden copse a thrush
His silver bell was tolling.

Once more, beside the singing stream,
Lost boyhood came to meeting,
And life was as a timeless day
That ends with Mother's greeting.

Once more I built my midday fire
And broiled a trouty treasure,
And ate and drank and praised the Lord
For life and simple pleasure.

I've had, thanks be! a happy hour
Of dreams and idle wishing;
And all because one early worm
Said, "Come, let's go a-fishing!"

Stamford, Conn.

What Liberia Needs

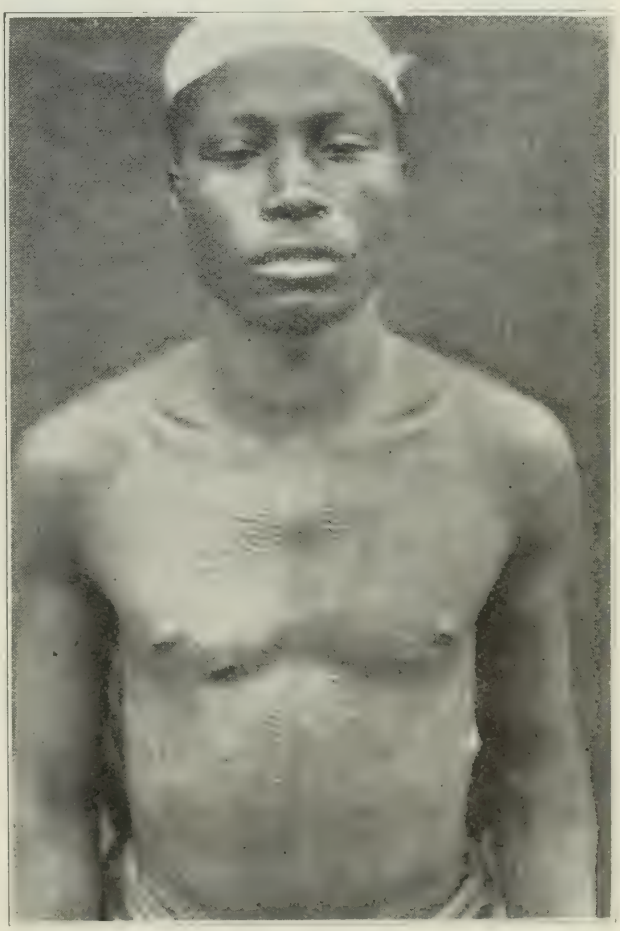
The Dangers and Opportunities That Confront Our African Protégée

By Frederick Starr

[The colony of Liberia, tho founded and peopled by Americans, was for a great many years quite neglected and left to battle unaided against the appalling obstacles of its environment. It had ceased to be needed for its original purpose, that of a place of segregation for freed slaves, and the country was esteemed of no value. Now, however, the times have changed. There is a boom in African real estate and the great European Powers cast covetous eyes on Liberian territory. The United States has several times been called upon to protect the pickaninny republic from the encroachments of her neighbors. Professor Starr occupies the chair of anthropology at the University of Chicago, but you will not always find him in it. More likely than not he will be in darkest Africa, farthest Japan or remotest Mexico, for he believes in studying his subject, man, from personal observation rather than from books.—EDITOR.]

In 1905 I sailed from Antwerp to the mouth of the Kongo River. When we reached Freetown, Sierra Leone, we spent several hours on shore. On returning to the steamer we found all greatly changed; the white crew was laid off and the steamer was swarming with black boys who had been taken on to perform the heavy work of the vessel so long as she should be in the hot country. In the morning I found that these black boys were Krumen from Liberia; they pointed out the shores of their country as we sailed by and told me of their people and their life. The captain of our steamer was an Englishman; he took great satisfaction in telling stories which showed his contempt for the little black republic and its rulers. It was his custom to laugh at their port regulations, to evade their customs laws, to insult their officers. Months later, in returning from the Kongo Free State, I sat at table next to a ship's officer who was never tired of telling of Sir Harry Johnston's great scheme of Liberian exploitation; matters were all arranged for Britain to gain the advantage which the wealth of Liberia offers. When we reached London, I found the windows of book stores filled with Sir Harry's great work upon Liberia, and considerable public interest in the subject.

It was these three things which turned my interest toward Liberia and led me to think of making an expedition to that country. I wanted to see the Kru boys at home; I wanted to see just how much of a failure the black republic is; I wanted to see how the English plans of exploitation worked out. It was, however, several years before I was able to make that journey. I have just returned and found much more of interest than I anticipated.



It is now almost one hundred years since the American Colonization Society was established and sent its first freed negro settlers to the West Coast of Africa; it is almost seventy years since, in 1847, the society severed its relation with the colonists and urged them to establish an independent form of government. We have no right to take any great amount of credit to ourselves for the original establishment; it was less from philanthropy or altruism than from selfishness that we began the colony; it was because we did not want freed blacks living among white Americans that we sent them to Africa. There have been various times during the period of Liberia's history when we might have helped her greatly; we have never quite forgotten our obligations, but we have never done all that we might for her benefit and profit.

It is not fair to establish a direct comparison between Liberia and any European colony upon the West Coast of Africa. It is not just, for instance, to take Dakar or Freetown and compare them with Monrovia. Senegal and Sierra Leone have had great advantages which have been lacking in Liberia. Those colonies have had the constant aid and sympathy of a mother country; they have been developed with the aid of vast home capital; they have had the protection of well organized armies against internal foes and external aggression; they have had chosen men sent out as governors who have given them advice, encouragement, instruction. Liberia has had to stand alone; her population was largely ignorant persons, despised, recently em-

erged from slavery; she has had no interest of a mother country; she has had no capital with which to push development; she has had no means of protection against native tribes or crowding neighbors; she has had to train governors from her own population, who have had to learn the business of government thru personal experience. When this marked difference in opportunity and material is realized, the wonder is that Liberia has been able to make any real achievement. As a matter of fact, while the direct comparison is most unjust, it can be made without serious discredit to Liberia. The standard of living, the average comfort, the construction of houses and other buildings in Liberia, falls little short of those in Freetown, if at all; of course, when it comes to public enterprises—harbor improvements, governmental offices, etc. —the European colony has notable advantage. In reality, Liberian achievement is marvelous in the face of all the difficulties with which the country has had to contend. Far from being a dismal failure, Liberia has proved an astonishing success. For more than sixty years her officers have been pitted against the skilled politicians of European countries; they have had to fight in diplomatic warfare with Great Britain, France and Germany. The wonder is that she was not long since wiped off the map.

In 1909, a commission of Liberians was sent to beg assistance from the United States. Thru a period of years she had lost land, first to Great Britain, then to France, both of which own adjacent territory; her commerce had been hampered by British schemers who desired to prevent her development until they themselves should control its results; she had been forced twice to borrow money from Great Britain—and both times had paid heavily for scant accommodation. Robbed of land, crippled in development, heavily in debt to a pressing creditor, a crisis had been reached in her affairs. The United States heard the appeal and answered; a commission of investigation visited Liberia and made a definite report, advising certain lines of aid. We have acted upon some of their recommendations. We have exprest to Great Britain, Germany and France our special interest in Liberian affairs; we have lent her colored officers to aid in training a native force; we have come to her financial relief, paying her past debts and taking over the administration of her customs houses.

The population of Liberia consists of three main elements: there are about 12,000 civilized and Christian blacks, descendants of American freed negroes, whom we may call Americo-Liberians, or Liberians proper; there are perhaps 30,000 coast natives, who speak English and have come into frequent contact with Liberians and the outside world; there are perhaps one million "natives," living in the interior, "bush niggers," most of whom speak only native tongues and are pagan in religion. The Liberians live in a few settlements near the coast, or along the rivers, a few miles inland. The natives consist of a score or more of different tribes, living in little villages, each tribe having its own language, its independent chiefs, its

NATIVE SOLDIER OF FRONTIER FORCE
Showing tribal scarring.

characteristic life and customs. Sir Harry Johnston says that the interior of Liberia is the least known part of Africa. Many of these native tribes still practice cannibalism, all of them are polygamists, and domestic slavery exists among them. The relation between them and the Liberians proper is almost *nil*. The area of Liberia even now is larger than the State of Ohio and not much less than that of Pennsylvania. If we were to take the town of Bellaire, Ohio, and divide its little population into about a dozen towns along the Ohio River, and were then to sprinkle the whole State of Ohio with villages of Indians, totaling one million, speaking a score of different dialects, and recognizing no control except that of their local chiefs, we should have something analogous to the Liberian situation. If, now, this population of Bellaire were to figure as an independent nation among the world's governments, think what a burden this would entail upon it. Liberia elects a President, Vice-President, Senators and Representatives; its President has a cabinet, each member with his own department of government; it maintains a Supreme Court, with a bench of judges; it has consuls, some with diplomatic powers, in many of the nations of the world. Would we be able in any town of 12,000 people in the United States to find such a corps of men of competence? As a nation, with privileges and obligations, Liberia must not only maintain this national government, but it must keep order over its whole area and prevent its million bush natives from troubling its neighbors. It is on the plea that Liberia is incapable of maintaining order that France and Great Britain are constantly crowding

A STREET IN THE LIBERIAN CAPITAL

upon her frontiers; it is a fact that to prevent aggression from outside she must maintain order within.

We must not imagine that neighborly aggression has ceased because we spoke. New boundary questions have lately arisen, both with Great Britain and France, and it looks as if they were getting ready to demand a new slice of territory. One of the crying needs of Liberia is to have a native frontier force, well drilled, ready to protect and maintain order at her boundary. Such a force has been organized; it has been in existence for several years; just at present it is being drilled under three young colored officers whom we have sent within the past year to Monrovia— Major Ballard, Captain Brown and Captain Newton. These men now bear commissions from the Liberian Government and are paid by it. The force will be developed to 600 soldiers; it is rather easy to collect them; they come from many of the interior tribes and, when they are enlisted, know no English; they seem to enjoy the life of soldiers and rapidly improve until in their conduct and drilling they present a creditable appearance. When actually disciplined, so that they will not loot or cause distress when marching thru a district of non-combatants, they should be a great advantage to the nation. Unfortunately, the Liberian Government is frequently in financial difficulties and the pay of these soldiers falls into arrears. There is always serious danger that, under such circumstances, the discontented force may arise against the Government and cause difficulties.

We did well to come to the financial relief of Liberia, but we did badly in the details of our method. The total debts were about $1,300,000; we arranged for a loan to her of $1,500,000; this would enable her to pay off all obligations, to have some ready funds left over, and to have a single, friendly creditor. Before securing this loan we insisted upon a receivership. It would have been a simple matter for us to have simply appointed a receiver of customs and leave the administration of affairs in his hands, as we did in Santo Domingo. Had we done so, it is unlikely that any other nation would have found fault; if any nation should have criticised the action, we could with consistency insist that we stand in a peculiar relation to Liberia and that the loan is too small to warrant great expense in the handling of the business connected with it. What we really did was to recognize fictitious interests of other nations in the matter; we arranged for an international receivership; instead of one American receiver we proposed four receivers — American, French, English, German. Inasmuch as the impoverished Government has to pay handsome salaries to all four, the plan was anything but economical; the dangers of difficulty and disagreement between the members of this international receivership are considerable. Surely instead of inflicting an expensive and complicated international receivership upon the country, we should have arranged for an economical, simple national receiver.

There is no question that Liberia has great natural wealth; her resources are yet almost untouched; she is the only part of the whole West Coast where large returns are certain for small investment. In order to secure her wealth of products, it is absolutely necessary that trails be opened up thru the interior. Trails, of course, already exist, but under present conditions they are frequently intentionally neglected; little chiefs do not want too easy contact with the outside world. It is absolutely necessary, if Liberia is to advance, that the good will of the chiefs shall be secured and that all trails shall be kept open. In no other way can the produce of the forests find its way down to the coast. Foot trails, of course, are of limited utility, and as rapidly as they are improved they should become actual roads, presumably to be themselves developed in time into roadbeds for light railroads. It is only by the improvement of means of transportation that the Liberian Government can hope to increase its income, which comes almost entirely from trade.

For the present, and undoubtedly for some time to come, the chief source of income for the country must be by trade in natural products, collected in the forests. It is time, however, that serious effort should be made to develop the

actual agricultural opportunities of Liberia. With a rich soil, abundant rainfall, tropical temperature, vegetation flourishes. Liberia should produce vast quantities of rice, corn, cotton, sugar, sweet potatoes, yams, bananas, plantains, ginger, coffee, cocoa, pineapples and other tropical fruits. There is no reason why in many parts of the country cattle, goats and sheep should not be raised in quantities. At present, a very large amount of foodstuffs is introduced from the outside world; fresh meat is to be had only when steamers pass; rice, even—of which the natives raise quantities—is imported. Formerly considerable coffee was exported; the coffee tree grows wild and is probably a native of the country, and Liberian coffee has a fair reputation in the foreign market; at present, very little is exported. It is curious that agriculture has never been a favorite occupation with the people. As long ago as 1826 and 1827 the famous agent of the colony, Jehudi Ashman, complained bitterly that the people all desired to trade instead of to practise hand labor and develop agriculture. It is certain that if it is to be permanently prosperous, Liberia must encourage agricultural pursuits. It was natural enough that freed slaves should look upon manual trades and field labor as contemptible; that they should look upon barter and trade as desirable. Unfortunately, at the time of colonization it was easy for men to trade. This dislike for actual labor continues to the present day; it is possible to hire bush natives to do the absolutely necessary heavy labor very cheaply. In Liberian houses great numbers of native servants are employed. Trade and politics absorb the thought and time of the best men in the community. It is going to be a difficult task to place agriculture and hand labor upon a proper footing, but it must be done and soon.

We must not expect much more in the direction of education than we would find in our own country in towns of six or seven thousand people. There are actually not many schools in the republic. The superintendent of education is a member of the Cabinet. The present incumbent is a native—a Bassa. He has general supervision of some ninety-one schools, in which number night schools and mission schools are included. The highest institution of public education is Liberia College, at Monrovia. It has done good work and most of the men of prominence in the Government today are graduates from it. It has, however, little more than the teaching force and equipment of a high school in one of our smaller towns. It needs strengthening in every way. New schools should be established, especially in the country among the native tribes, and special schools of agriculture and manual training are a crying need. President Howard, in his inaugural address in 1912, recognized the necessity of prompt development in education and agriculture. Besides Liberia College, there is in Monrovia the College of West Africa. This is a Methodist mission school, doing an excellent work for both Liberian and native students. There are also important Episcopal schools on the St. Paul's River, and in the neighborhood of Cape Palmas.

The President of the republic was kind enough to give a reception in my honor. On that occasion I was asked to make a few remarks regarding Liberia. I stated that in my opinion Liberia's greatest asset is her native population. Twelve thousand people, no matter how interested, wise and industrious, cannot possibly carry the entire burden. If Liberia is to prosper in the future, it can only be because the Liberians secure the hearty coöperation and friendly feeling of the million natives. If *they* can be shown that their interests and development are to be gained only thru friendship to and recognition of the Government, the prosperity and success of Liberia may be secured and her independence maintained.

Chicago, Ill.

If Every Face Were Friendly

By Sir A. T. Quiller-Couch

["Q" has so long been the sign of whimsical narrative and keen comment that introduction to Sir Arthur would be impertinence, but our readers will pardon a reminder of the breadth of achievement which includes in thirty-six volumes that princely anthology, *The Oxford Book of Verse*, romance and short stories, poetry—and parodies—and criticism.—EDITOR.]

It actually happens to most of us when we are born, and for some time after; but this must be simply because we are weak. Few infants are beautiful, still fewer meritorious; and indeed the friendliest face of all is hers whom our own exploit has just afflicted with intolerable pain. To some of us again it will happen when we die, and again (I suspect) because we are helpless and nothing matters. We protest against the first insult with a feeble wailing:

> On parent knees, a naked new-born child,
> Weeping thou sat'st while all around thee smiled.

To the last we oppose that mask of scorn, calm, set, impassive, which even a weakling must win in the end—yea, tho all his days have been spent in truckling to his fellows. In the interim we have one job to do in the world and he to whom every face is friendly may be sure that he is shirking it.

When this question was posited, I passed it on to Cynthia, my "dear critic of the hearth." "You, of all men!" she commented, having reason only too dire to know my instinct for lost causes and forsaken beliefs—or rather, for causes that have nothing to lose and beliefs that still await the compliment of betrayal. In truth, on ninety-nine points out of the hundred she finds me a dubious hesitating Christian; whereas on the hundredth I am (to her equal if not greater disappointment) firm as a rock. The rock stands on no base of doctrine, tho I drag in doctrine to support it when we argue across the table. I have an incurable trick of liking my adversary.

She, always practical, demands to know if I agree with mine adversary while in the way with him; and then undoubtedly she may score a point. But I yet maintain that an enemy serves you more constantly than a friend, *for he seldom disappoints*. It is good sense, if poor rhyme, that

> He who would love his fellow men
> Must not expect too much of them,.

We expect too much of friends, too little of enemies; and so the enemies get more than their share of chances. Upon us, on the other hand, rests an obligation to be more constant in amity than in hate, especially in public life. "It is our business," says Burke, "to cultivate friendships and to incur enmities; to have both strong, but both selected; in the one to be placable, in the other immovable." A man is permitted to rest under illusion concerning his friends, as woe betide him if he do not cherish a lifelong illusion concerning his wife. But if he truly desires to see himself steadily as others see him, as a help to the *know thyself* recommended by sages, let him keep an eye on his enemies rather than any looking-glass which reflects him in his favorite postures. There is a story of a man whose hate of another man went deep as hell. In the end he could endure the other man no moment longer: so he killed him and buried him as nearly as he could to hell. But the corpse was no sooner out of the way than the survivor began to suffer from a loneliness, which turned into an unendurable restlessness and drove him at length to visit the grave and disinter his victim. He dug lower, in the end tossing aside his spade and digging with clawed hands, ghoulishly. So he dug until, laying bare a face, he gazed and recognized it for his own.

Of all parables known to me, this is about the truest. As iron sharpeneth iron, so a man sharpeneth the countenance of his—enemy, and is sharpened and shaped by it. I am not preaching that in public life a man shall be a Phocion or a Coriolanus. Coriolanus held his fellow creatures in a scorn which (had he possessed logic) stultified all service of them. He was, to be short, a mere monstrous egoist. I think better of Phocion for the legacy which, when his countrymen put him to death, he left to his son, "Bid him never revenge the wrong the Athenians do me." That was

noble; it anticipated practically on the lips of a man going to his doom a truth which Marcus Aurelius afterwards expressed at leisure: "The best kind of revenge is, not to become like unto them." Yet I am sure Phocion was vain and wrong when, making a speech which the public interrupted with applause, he turned to a friend at his elbow and asked, "Have I said anything foolish?" If he so despised assent, why need he have made any speech at all? Unless a man be hopeful of some power to persuade I cannot conceive what business he has, or can think he has, upon a platform.

We are here, as I suppose, to strive with the multitude; not to be its slaves and as little to be its scorners; to persuade it, and as a preliminary, to understand it; to understand even its wrath, for its wrath at best pays us the compliment of being interested in us. If we believe with Ecclesiasticus, that no man is more faithful than the counsel of our own heart, that "a man's mind is sometimes wont to tell him more than seven watchmen that sit above in a high tower," and if we have the pluck to stand by that belief, we may likely enough at some time in our lives find that wrath denouncing us as enemies of our country or of religion, and be under the bitter necessity of learning, with Ibsen's Doctor Stockmann, that the strongest man on earth is he who stands alone. How terrible, for example, was that ordeal of a nation's hate thru which Bright and Cobden past in the first year of the Crimean War, and how gloriously they stood it! Recall Bright's letter, written in the worst of it, to a mayor of Manchester who had invited him to attend a meeting for the Patriotic Fund:

> You must excuse me if I cannot go with you: I will have no part in this terrible crime. My hands shall be unstained with the blood that is being shed. The necessity of maintaining themselves in office may influence an Administration; delusions may mislead a people; Vattel may afford you a law and a defense. But no respect for men who form a Government, no regard I have for *going with the stream*, and no fear of being deemed wanting in patriotism, shall influence me in favor of a policy which in my conscience I believe to be as criminal before God as it is destructive of the true interest of my country.

There are cranks in this world, some of whom seem to shape their actions with an eye on posterity. There are even stranger cranks—and I think Phocion was one—who would seem to posture for the approval of antiquity. But the above letter of Bright's has no sly glance forward, or backward, or upward at Her Majesty's Ministers of that date, the nation's watchmen seated above in the high tower; but inward, upon the counsel of his own heart, and to be fired by the pride of his own manliness. A "little touch of something like pride," says an old seventeenth century writer, "is seated in the true sense of a man's own greatness, without which his humility and modesty would be contemptible virtues!"

Indeed, a man has in the end less to fear from this wrath of the public than from the smiles of a world that would allure him to be one with it and one at the same time with the flesh and the devil. When the powerful change their face and flatter us, that is the time to beware. There lies the crisis, to maintain good manners and yet keep up the combat. "It is easy," says Emerson, "to live after the world's opinion; it is easy in solitude to live after one's own; but the great man is he who in the midst of the crowd keeps with perfect sweetness the independence of solitude."

Yet I suppose we all have a longing to end well beloved. But a few of us can hope for any continuance of fame; and as the poorest look forward to something of a funeral, so the mass of the better-to-do hanker for a handful at least of genuine mourners:

> All I can
> My worldly strife shall be
> They one day say of me,
> "He died a good old man."

The shortest way to this would seem to be by living bravely, loving where we can, dealing courteously, endeavoring to give our adversaries credit for good intentions. No one—if men were frank—can give us sixpennyworth of information concerning any other world we may inhabit; but there's a pleasure in leaving a name to call up, when men happen to remember it, a certain light in the eyes and the impulsive words, "I wish you had known him!"

The Haven, Fowey, Cornwall.

A Dramatist Who Means Something

A Review of Brieux's Latest Play and a Sketch of His Life Work

By Edwin E. Slosson, Ph.D.

It is at first thought curious that Brieux should have acquired such a high reputation outside his own country; should, in fact, have been more highly esteemed elsewhere than in France. The plots of his dramas usually turn upon some point of French law or custom quite inapplicable, and therefore not altogether comprehensible to other people. But Brieux is more read today in England and America than any other of the living French playwrights except, of course, Maeterlinck and Rostand, who live in an imaginary world. Yet Ibsen's plays were as narrowly Norwegian in their setting as Brieux's are French, and that did not interfere with their universality. Perhaps even it was the cause of it. Perhaps if a man describes his own neighbors with real accuracy he will be found to be describing foreigners with real accuracy. For it seems that sinking a shaft deep enough in the social strata of any part of the world he will strike the same rock bottom of a common humanity. Countries differ only in their surface sedimentation.

BRIEUX

Then, too, Brieux has the advantage of living in France, the land where things happen earliest. French clocks are always a little ahead of time. French legislators are often called upon to deal first with new problems, with social, political and industrial difficulties which in other countries do not become serious until some years later; for example, the regulation of automobiles and aeroplanes, the prevention of race suicide and sabotage. So it happens that many of Brieux's plays written years ago are only beginning to have timeliness in America.

But in the feministic movement France is backward, so the play which Brieux has put upon the Parisian stage this winter deals with a problem that we have long been familiar with, tho we cannot say that we have solved it. To translate *La Femme seule** as "The Lonely Woman," as has been done, is an absurdity. It makes the title contradict the thesis. The main point to the play is that the heroine, tho alone in the world, is not lonely, but quite capable of taking care of herself, thank you. There is really no necessity for translating the title at all, for we long ago borrowed the phrase from the French, and our lawyers still use it in its old form, *feme sole*, with the identical significance of a self-supporting woman.

But a good translation of the title into English—or at least into American—would be "The Bachelor Maid," for Therese is, by character and situation,

**La Femme seule* and the other plays of Brieux are published by P. V. Stock, Paris, at 3 fr., 5 c. each*

much the sort of young woman we call by that name. Tho left an orphan she has means and is well brought up and educated, until, at the age of twenty-three, she is about to marry happily, when a rascally attorney absconds with her fortune. Of course this breaks off the match, for her *fiancé* cannot afford to marry without a *dot*. Her guardian, who has also lost his money and must go to work in a provincial town, offers to keep her in his family and to get her married if somebody can be found to take her, but she refuses to be a burden and shocks everybody by announcing her determination to earn her own living.

She has reason to think that she can do this easily, for the articles she has contributed to a feminist magazine have been welcomed and well paid for, and her portrait has been featured on the cover. But when she applies for a position on the periodical she learns that she is not worth so much as when she was a society lady. However, she does get work at sweatshop wages on the editorial staff of a newly founded journal, *The Free Woman*, where her experiences are most amusing and disillusionizing. Brieux with his usual impartiality gives all types of workers in the cause of feminism—the saintly, the sensational, the sensible and the selfish. The first part of the magazine is devoted to serious articles, the rest to fiction, the beauty page, "Chats with the Doctor," fashion notes, and exchange of experiences and household hints between real and suppositious subscribers. Most of the departmental editors are women, but use masculine pseudonyms, because, as is explained, "it inspires more confidence in dealing with serious things." One woman's name, however, appears on the title page, the Vicomtesse de Renneville, who has charge of the fashion page, but nevertheless is a man, the publisher. A scrap of the dialog will show how the periodical is conducted. The editor, Madame Nerisse, comes into the office to suggest an article to one of her staff, Caroline Legrand:

MADAME NERISSE: Ah, good morning, Legrand. I want to ask your advice about an idea that has just come to me. I am thinking of starting in *The Free Woman* a campaign for the organization of a league of fashionable women . . .

CAROLINE LEGRAND: And others?

MADAME NERISSE: Fashionable women and others who will promise never to wear on their hats ornaments made of the wings or of the whole bodies of little birds, as a protest against the massacre of these lovely creatures.

CAROLINE LEGRAND: So it is no longer *The Free Woman* but "the free bird"?

MADAME NERISSE: What do you mean?

CAROLINE LEGRAND: You should rather form a league to abolish the whole hat as a protest against the misery of the women who have sewed the straw at the cheapest rate or woven the ribbons for a starvation wage. As for me I will become soft-hearted over the fate of the sparrows when there is no longer reason to weep over that of the working girls.

MADAME NERISSE: That's it! There's your article!

CAROLINE LEGRAND: Good gracious!

MADAME NERISSE: In the form of a letter to a deputy (it is better to make it a man since we are going to put him in the wrong) who wants to found the league in question. Then clinch it with your phrase about the sparrows. Do you see?

CAROLINE LEGRAND: All right. Any way you are not obstinate about sticking to your opinions. So much the better when they are bad. Hand me some paper.

But Therese is forced to leave the woman's journal because of the jealousy of Madame Nerisse, and finds out by bitter experience how hard it is for a girl to earn a decent living in Paris. Met with injustice and insult on every hand, she comes to realize that women must combine together in self defense. She organizes a woman's workroom in a provincial bookbindery and manages it so successfully that Vincent, one of the men in the shop, asks her to take in his wife. Their conversation covers many sides of the question of women's work in factories. But I can only quote it in abbreviated form:

THERESE: No. I want those who have need to work or who are not needed at home.

VINCENT: You are quite right, but I don't ask you to pay my wife much. Not a man's wage, of course.

THERESE: Why not, if she does the same work?

VINCENT: Because she's only a woman.

. . . . . .

THERESE: But you earn good wages here. You can live without forcing your wife to work.

VINCENT: Well, what little she earns will pay for my tobacco anyway.

THERESE: You don't smoke that much, come now! . . .

VINCENT: But besides I want to buy a bicycle.

THERESE: What for? You live only five minutes' walk from here.

VINCENT: So I can take a spin on Sundays.

THERESE: There's another thing you've not thought of. You have two little children, who will take care of them if your wife goes into the factory?

VINCENT: Don't let that worry you. She can take them to the *crêche* in the morning dirty and get them back in the evening all cleaned up.

THERESE: And supper, who will get that?

VINCENT: My wife, when she gets back from work.

THERESE: While you take a drink.

VINCENT: Yes. I will give her all the time she needs.

THERESE: Who will do your mending?

VINCENT: My wife.

THERESE: When?

VINCENT: On Sunday.

THERESE: While you are taking your bicycle ride?

VINCENT: Yes, it will be a pastime for her. And in the evening I will take her out to watch me play billiards.

But somehow the arrangement so naïvely proposed fails to satisfy Therese, and Vincent, angered by her refusal to admit his wife, threatens her with the power of the union. Not in vain, for a telephone message from the syndicalist headquarters in Paris orders the expulsion of the women, and when the manager determines to stand by the weaker sex, sabotage is resorted to and the shop is wrecked. The play closes with Therese standing amid the turmoil, defeated but defiant, planning to renew the conflict with better organized forces:

THERESE: There is nothing left in the shop but weeping women. Well, I give way. . . . I will take the evening train for Paris. But your workingmen needn't rejoice over it. In this new war of sexes it is they, the men, who will be beaten, for women work cheaper because they have no need of extra pay to spend in the saloon. And it won't be only the workingmen who will get beaten. . . . The young men who are afraid to marry girls without dowry will later find their path blocked by these unfortunate women whom they have compelled to go to work. You must choose your side. New times have come. In every land, in cities and in country, among the laboring classes and the poor, in every home deserted for the saloon or left unfilled by men without the courage to marry, there will arise a woman who will abandon the household and come to seat herself by your side in the shop, the factory, the office, and the counting room. You have not wanted her as your homemaker, she will not consent to be your mistress, so she will become the working woman, your competitor—and your victorious competitor. Adieu.

This may serve to show how Eugène Brieux uses the theater to enforce a lesson. Born in Paris in 1858, of poor parents, he was thirty-four years old before he gained a hearing on the French stage with *Blanchette,* a play dealing with the education of working girls. Now he is an Officer of the Legion of Honor and Member of the French Academy. Yet he has never been popular. The average theater-goer prefers fictitious woes to real ones, and particularly dislikes having any responsibility for them thrust upon him. He wants to maintain the spectator attitude toward life and regard all the world as a stage. But Brieux in his two dozen plays has taken up one by one the burning questions of his time and country and handled them without gloves; political corruption in *L'Engrenage,* fashionable charity in *Les Bienfacteurs,* racetrack gambling in *Le Resultat des Courses,* the dowry system in *Des Trois Filles de M. Dupont,* the nurse system in *Les Remplaçantes,* race suicide in *Maternité.* He has muckraked the professions one by one, the lawyers in *La Robe Rouge* and the doctors in *L'Evasion.* This last begins with the following amusing conversation between a famous doctor and his hospital assistant:

DOCTOR: Is there something you wanted to ask me about?

ASSISTANT: Yes, doctor. A patient who does not improve.

DOCTOR: That will happen!

ASSISTANT: Of course, but—he wants to go to Lourdes.

DOCTOR: Let him go.

ASSISTANT: But think! What if he should be cured.

DOCTOR: You can always find some scientific explanation.

ASSISTANT: A suggestion?

DOCTOR: Certainly. That accounts for everything. Anything else?

ASSISTANT: Yes. No. 4 remains in the same state.

DOCTOR: Have you tried everything?

ASSISTANT: Everything.

DOCTOR: Even doing nothing?

ASSISTANT: Even doing nothing. None of us can tell what is the matter with him.

DOCTOR: We will find out at the autopsy. We must wait.

ASSISTANT: Meanwhile stopping all treatment.

DOCTOR: No. One ought never to give the impression of not taking an interest in a

patient. That would be a mistake. A regretable mistake. Do something, no matter what.

In contrast to these fashionable physicians Brieux presents the old school country doctor, who in talking to his distinguisht colleagues says:

I am proud of being a physician. I experience the greatest pleasure when after entering a sick chamber and finding everybody in tears I go out of it leaving patient and relatives with a little hope. For, you know, the doctor rarely cures, often relieves but always consoles. As for gratitude—well, I divide patients into two classes: first those I treat gratuitously for the pleasure it gives me, and, second, those who pay me. If in addition I claimed thanks from either class, it would be like asking to be paid twice.

In America attention has recently been drawn to Brieux by the use of his play, *Les Avariés* (*Damaged Goods*) as a weapon in the energetic campaign now being waged in several States against White Slavery and the Blacker Plague.[1] *Les Avariés,* when it was first presented in 1901, shocked all Paris, less apparently because of its disgusting subject than because of its stern condemnation of the double standard of morality. It was at first prohibited in France by the censor, and in England it is still under the ban. Probably the police who constitute our censors would not allow it to be produced publicly in any American city. But a subscription performance was given in New York on March 14, under the auspices of the *Medical Review of Reviews,* to an audience very different but even more distinguisht than usually attends a "first night," for the Fulton Theater was packed with physicians, settlement workers, eugenists, philanthropists, authors, suffragists, ministers and university professors, about equal numbers of ladies and gentlemen. The play was introduced by the reading of Shaw's preface by the Rev. J. H. Holmes, of the Church of the Messiah. The leading roles were taken by Richard Bennett (well known as Barrie's "Little Minister"), Wilton Lackaye and Grace Elliston, and altho there had been little opportunity for rehearsal the presentation was very effective; much more impressive as an object lesson on the stage than in the mere reading.[1] Except for the fact that it deals frankly with tabooed topics the play is not objectionable in language or scenes. Whatever one may think of the propriety or advisability of discussing such a theme upon the stage, there is something absurd and more than absurd in the fact that hundreds of plays are being given depicting in glowing colors the joys of licentiousness, and yet the one play which shows its dangers is prohibited. Those who are promoting the movement intend to give *Damaged Goods* at Washington before a congressional audience, and perhaps also at the State capitals during the legislative session. For this purpose the drama is especially adapted, as the last act is nothing more than a lesson to legislators, tho Brieux is not one who believes that social evils are to be cured by laws and yet more laws. He believes that most of the trouble is caused by ignorance and urges education, public enlightenment and franker recognition of existing conditions. All this may be needed, but still we may well doubt its effectiveness as a remedy. The drunken Helot argument is not a strong one, and those who lead a vicious life know more about its risks than any teacher or preacher could tell them. Brieux also urges the requirement of health certificates for marriage, such as many clergymen now insist upon[2] and which doubtless will be made compulsory before long in many of our States.

Brieux paints in black colors yet is no fanatic; in fact, he will be criticised by many as being too tolerant of human weakness. The conditions of society and the moral standards of France are so different from those of America that his point of view and his proposals for reform will not meet with general acceptance, but it is encouraging to find a dramatist who realizes the importance of being earnest and who uses his art in defense of virtue instead of its destruction.

New York City.

[1] *Three Plays by Brieux,* publisht by Brentano's, New York, at $1.50, contains *Maternity, The Three Daughters of M. Dupont* and *Damaged Goods,* with a preface by Bernard Shaw. A cheap edition (25 cents) of *Damaged Goods* is issued for propaganda purposes by the Society for Social Hygiene, Hartford, Conn., and by the Medical Review of Reviews, New York.

[2] See the article on *Practical Eugenics* by Rev. Charles M. Sheldon in THE INDEPENDENT, August 8, 1912.

The Folk Ahead

A Forecast of Fine Weather from a Veteran Optimist

By E. P. Powell

I like this way of slowly sliding down into the arms of the year; then lying close to her heart a little while, while the violets have time to blossom before we get at the tapping of the maple trees and the ripping of the sod for seed time. The same months and the same weeks and days come round and round, and it would be very inconvenient if we were in any way unhitched from the past. We have in our life history a couple of hundred thousand years, at least, woven well into our bones and brains. All these years had no record except in our evolution, not until a few thousand years ago, when words were invented and manuscripts began to be written. Yet the record was just as well kept as if Herodotus had begun to write history thousands of years sooner than he did. After all, there is only one great and ever living fact, and that is evolution, the fact that we have always been going ahead; and that as for man there is but one great human faculty being evolved, that of foreknowing and foreseeing what is to come about. The best definition of the human being is Nature's tally.

There is no mistake greater than to suppose that all prophecy belonged to a handful of our gifted ancestors. Evolution is making a prophet of every one of us. Mothers get very previsionary, and fathers anticipative. They do not know the little events ahead, but their experience enables them to sum up what becomes sorrow or happiness for their boys. What is school for, but to learn to heed the wise that have gone before us? The Chinese were not all wrong in teaching nothing but Confucius; he was the summary of the Chinese calendar. Even black Jim foretells me the weather, with delicious conceit; his instincts recognizing prophecy as the supreme human power. If he would really set his wits into correlation with his hands, he could foretell a great many things more correctly than he can foresee the weather.

If you study history you will find that all great events have come about in just this way, that people were first forced to foresee, and then to work out the future. The trouble has always been to pick out the truth-tellers. The people found it necessary to kill "false prophets," those who handled data unfaithfully. Our Civil War came from a crop of false prophets. I remember a few years ago hearing Wendell Phillips assert that ten years from that date, the four greatest names in American history would be Oliver P. Morton, Ulysses S. Grant, Benjamin F. Butler, and the fourth I do not remember; it might have been Abraham Lincoln. Gladstone was an able prophet, and very fond of prophesying. In the days of very high tariffs he foretold something very much like the popular sentiment and political will of our present generation. Cavour told national fortunes like a gipsy girl. It has been the fate of Europe to work out civic problems as he forestated them. It was a great group of prophets that we had at the beginning of our republic. I should like to see Hamilton rise from the grave in this present flush of democracy. Even Jefferson would be staggered if told that China had burst its political chrysalis. He foresaw two American republics, one on either side of the Mississippi.

It is remarkable how a war like that in the Balkans will set all tongues wagging about the future. If Napoleon were alive now he would probably be chairman of the Hague Conference. To go farther back, I think that we shall find that the real difference between our Aryans and other races was that they tolerated looking forward. I am afraid the Jews stoned some very good men as liars, yet they foresaw a Jesus, long before they got him. That was worth the while; and Lot's wife settled the proper fate of the backward-lookers very justly. So it was that in the spirit of the Puritans there was a Washington and a Lincoln, at least two hundred years before they were born.

All this while am I writing an apology for thinking myself to be a prophet? I am much more concerned to know just the right proportion of looking back and of looking ahead that belongs to an honest thinker. The argument is not all on one side. The Bible writer who tells us there is "nothing new under the sun" had much to confirm him. Jefferson was as much of a low tariff man as Wilson, one hundred years ago. He was also a State University man, himself creating the first that existed, and in that same University of Michigan women could be instructors. That was in 1817. He advocated a single term for the Presidency, and a longer one; but as for the Cabinet's being represented on the floor of Congress, I think that must be set down to Mr. Wilson—only he is following our folk in old England, where any measure may be advocated by the Government openly in Parliament. Some men, good prophets, live one hundred years ahead of themselves.

Most of the world, after all, is new; and then again, most of it after all is old. Progress comes in a zig-zag way; and measures after going to sleep for an incubating period, are revived to be embodied in actual civic or religious life. I got a letter the other day asking if I favored woman's suffrage. Bless the dear souls! the secretaries and the presidents! Not one of them had been thought of when I was shaking hands in my pulpit with Susan B. Anthony, and Elizabeth Cady Stanton, and Mrs. Livermore, and a lot more who are in danger of being forgotten. Turn which way you please, however, and I challenge you to prove that betterment cannot be marked down at the bottom of each page of time as God's will and Nature's achievement. You cannot write history from any other viewpoint.

The whole world could not have sustained over fifty millions of people during the shepherd era; and now the dear old Mother manages to feed a family of sixteen hundred millions. Indian corn was not eaten except by Indians until two hundred years ago; but this year we have in the fields of America three hundred billions of bushels, a good deal more than enough to feed all the people on the globe a few thousand years ago. And yet we have only about twenty bushels to the acre, while the prophets tell us that we shall yet have one hundred, or more. We are seeing the day of one thousand billions of bushels of corn and five thousand millions of people, and are getting ready for it.

It is a great thing to learn that nothing is perfect, and least of all man; nor is it at all impudence to undertake to make the world over. The worker with God, the helper in the great home life, that takes in all foods and fruits and motors, and character and morals as well, is needfully not only a forward-looker, but an upward-looker. Every year, as a child of God, he learns to expect new adjustments, and to see whatever was, made better than it was originally. The wild woods become beneficent; weeds turn into edible plants; good things become twice as good; beautiful things twice as beautiful; and so it is that God and man are gradually getting to know each other by working together. Can you imagine the breadth of the problem that proposes to banish from the earth everything inferior?

Our experiment stations are undertaking to rid us of low grade cattle, that do not pay the farmer for his labor and his feed. Others are attacking ticks and flies and other insects that deal out death in our herds; while others tell us that wheat must yield and shall yield three times the present average of bushels to the acre. The mastery of manhood is demonstrated. There are over fifty great organic bodies whose sole object is to make the years worth the while and stuff the months with progress. All of these have their clearing house of evolution in the central department at Washington—the House of American Prophets. The American world is organizing to foresee, foretell and then achieve.

So you see, as we check off the years, each one identified by its own prophetic fulfilments, it is not an assumption to ask, "Who is he that will tread the earth by and by, say fifty or one hundred years from now?" I do not care so much what is to be our food, or our locomotion, or our religion; for I know that all of these will have to be in close correlation to the man himself. With all the rest of progress we have the germ of a

new sort of manhood in the social incubator. How could it be helped? The fight now is to give to every child a fair entrance into the world, and every human being that wholesomeness which alone makes life worth the while. The last enemy to be put under foot is said to be Death, and we are already foreseeing that sort of old age which does not tremble with the burden of a century, nor will lose the fire of youth even farther along than that.

It is curious that not until recently had we invented a word to define a nationalist; our biggest man was only a states-man. Before the Civil War we were developing section men, such as Douglas at the North and Stephens at the South. Lowell described Lincoln as

> The kindly-earnest, brave foreseeing man,
> New birth, of our new soil, the first American.

Lincoln was in no other way greater than Douglas, except in his inability to foresee anything but a whole union.

Already the nationalist leads on to the internationalist, and the prophecy ripens that unites in friendly cooperation all nations on the globe. It is not true that Christianity is failing in the light of a higher hope; but this is true, that born over into the age of human brotherhood, we are beginning to comprehend better that greatest of all prophets who lived in Judea nineteen hundred years ago—not inaugurating, but foreseeing, international love. "Go, preach my gospel to all men." When Christians all become internationalists, that is real Christians, they will vote down war and forbid the waste of sweat-stained dollars on battleships.

The best things have always been the most abused, and man is still an astounding example of lack of rational culture. Somehow, we manage to get balanced rations for horses, and we know how to train calves to a standard; while children our social order begins to spoil from the outset. Family discipline and family diet have been about equally at fault; and what weak mothers and silly fathers could not do, school has accomplished. By twenty the beautiful boy becomes a slave to narcotics; and the girl is padded and painted. At the State Fair I stood before a pen of Duroc pigs, with wonder. For pigs they were absolutely perfect, unblemished; the triumph of the country home. Bless me! but what a contrast was the owner! How long before we shall get at work on a great International Human Improvement League?

Compared with his predecessor, the future man will probably make very little account of believing. It looks that way now, under all the religions. That does not mean that he will have less faith; only that his faith will be in law and in Nature more than in documents. There will be such overwhelming confidence in God that grumbling and doubt will be impossible; only that the God of the future man will not be a tribal deity or a national fetish, but that One "in whom we live and move and have our being." To come to an understanding with the Father; that is now the great need. Faith remains the saving power of the world, but it must be real confidence and absolute trust in the Divine Will, by which we exist. We must learn, and I think we are learning, to do our plowing and run our gasoline engines hand in hand with God. Prattle all the prayers you please, if modestly; or go enwrapped with silence; but for the sake of the future babes, do not indulge in croaking nor in impudent familiarity.

Foreseeing the coming woman, I think we may miss the motherhood of the old New England type, and it may be that with all the rest, home will not be quite as warm a place as it was in the time of Abigail Adams. But God forbid that we shall lose the mother thought out of this world. Possibly there is an element of socialism going to intrude on our child raising. I see that one state has set apart a one thousand acre farm as a human stock farm. It is proposed to put on this farm twenty-five select couples, where they and their offspring can live under ideal conditions, having the supervision of social and medical experts. Theodore Dreiser complains that parents have given over their influence on their own children in favor of public school teachers. He sees no escape from the influence of moving shows and public libraries but to give the state larger control and the home less. I doubt this solution. Home is the biggest word yet, and our schools are slowly moving

toward home enlightenment. Eugenics is the highest science, far higher than the breeding of cattle and the creation of fruits; but while it protects the rights of the unborn babe, it involves making of the mother a higher type of woman. I think this coming woman will be out of sight the grandest product ahead.

Suffraget is a lapse of evolution, one of those lapses that always occur in connection with every forward movement. It constitutes a backward-looking appeal to force. The passage from the cramped education of our mothers, when not a college in the United States was open to a girl, over to the present era, when all privileges are hers, suffrage excepted, must necessarily leave a lot of material associated with woman that belongs neither in the past nor the future. Someone will have to wield a broom by and by, and sweep up the rubbish. Man is more differentiated than woman. She is more in the making. After suffrage, with schools and pulpits free to her, what next? Will she settle into a profound satisfaction and a determination to make the world more beautiful and life more true? Will she master fashion, which is today a dictator more imperial than man?

I am, however, more interested in the young man ahead; the young fellow who is now above all an athlete, a chap who gets the gracious recognition of the crowds and the highest awards from governments and cities and associations for lofty jumping or throwing a hammer. I am thinking this is not the end of it; this young man will learn to use a hammer as skillfully as he now only throws it; and all the world will still rise up to do him honor. I do not mean it in contempt, only because that is the way we have of expressing it, when I say that there is just now about seven million horse-power in our schools used up in throwing hammers, and another seven million used up on foot races; and that these fourteen million horse-power boys, including not a few girls, could be of great use to the United States if they hammer and the saw to accomplish the would use the hoe and the plow and the needful work of society. Do not be alarmed. Let up on the brakes. The new church folk will not like the priests so well, but the prophets more. They will always be looking forward, and rarely backward. They will do better plowing; will make two bushels of wheat grow where one grew before; wash dishes from a sanitary standpoint; reverence parents, keep the Ten Commandments, obey the Golden Rule, and let the genealogy of Joshua and the parable of Jonah take their place where they belong—outside of religious faith. I hope we shall never forget to ramble with Jesus in the garden, and with Him take divine care of the boys and girls. It will help if at the same time we keep cleaner roads and put good cooking into our creeds. Meanwhile, the new school will have less to do with stuffing children with facts, and more to do with teaching them how to make a good use of knowledge. The trouble has been that our schools, both low and high, have failed to give us a philosophy of Life. The new education will concern itself with adult as well as child, with eighty as well as eight. Instead of making Presidents and Senators, it will begin by laying the foundations of character.

To be all the while looking more and more into the future, that seems to be the destiny of the coming folk. We have got to learn how to be prophets, how to use everyday facts so as not to turn them over into lies in our lives or in our social relations. Nature wants a race with eyes wide open, folk who know what they see, and can translate it into action. What we are looking for we shall surely get; only this, our public institutions must breed and encourage good lookers rather than the good looking (they will, however, be one). Society must stop rewarding blindness, whether in the name of education or religion. Let us have a few great prophets for leaders, but let us understand that all the people must be trained to see clearly and interpret wisely. "There arose a prophet in Judea"; well, why not? Why not in Washington?

Sorrento, Florida.

State Rule by Commission

Kansas as Usual Comes to the Front with a Novel Proposal

By Charles Moreau Harger

The average State legislature considers in its fifty to eighty days' session from 900 to 3000 bills. Of these about one-third are enacted into law. The process of sifting engages the strenuous activities of committees, lobbyists, governors, speakers and the usual abundance of voluminous oratorical leaders. In the closing days of the session omnibus roll calls, when a hundred readers are at the same time mumbling the texts of one hundred bills, make the scene ridiculous and permit abuses in legislation. Then, in one grand upheaval to end the session when the per diem of the members expires, hundreds of bills are left unconsidered, among them many meritorious measures demanded by the people of the commonwealth.

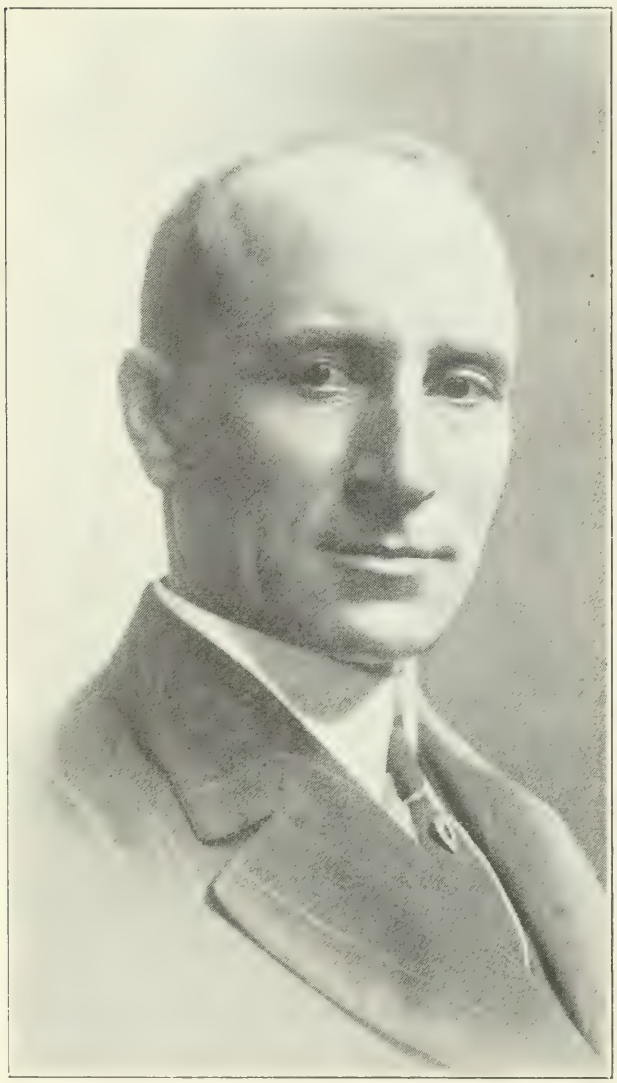
This biennial exhibition of inefficiency has become one of the most criticized features of State government, and methods for securing a better system are demanded. Just how this change shall be effected is not yet fully determined, but thinking men are endeavoring to work a plan that shall give sounder legislation and save our statute books from the idiocies that now appear there. Not to mention the faulty diction that puzzles even the courts to determine what the legislators meant to say, the statutes of the States are filled with examples of ill digested laws, some of which are amusing and some vicious.

In the early days of Oklahoma, the compilation of laws was made with much matter taken from the statutes of the adjoining States. When the official publication was made the inhabitants of that prairie commonwealth were surprised to find that one chapter was devoted to full regulations for harbors, wharfage and lighthouses, a copy of the regulations made by Texas for its Gulf ports.

Kansas has had in its statutes for six years this section of a law adopted for the regulation of automobile traffic on the highways:

> Nothing in this section shall be construed as in any way preventing, obstructing, impeding, embarrassing or in any other manner or form infringing upon the prerogative of any political chauffeur to run an automobilious band-wagon at any rate he sees fit compatible with the safety of the occupants thereof; provided, however, that not less than ten nor more than twenty ropes be allowed at all times to trail behind this vehicle when in motion, in order to permit those who have been so fortunate as to escape with their political lives an opportunity to be dragged to death; and provided further, that whenever a mangled and bleeding political corpse implores for mercy, the driver of the vehicle shall, in accordance with the provisions of this bill, "Throw out the life-line."

The provision was added by a hilarious politician who was imprest by the band-wagon idea in his party's management.



Two new theories of State government have come to the front as proposed remedies for the weaknesses of legislative action. One of these is that of a dual session of the legislature. The plan provides that the members shall gather and be in session for two or three weeks receiving bills and referring them to committees. Then there shall be a recess of a month, during which the committees shall conduct hearings from interested citizens, shape the bills into form, and prepare them for presentation to the full legislature at its second session. At this session no new legislation shall be introduced, but all the time shall be given to the reports of the committees and to final action on the matters presented. It is claimed in favor of this plan that there would be given time for the legislators to consult with their constituents regarding the measures before them and be enabled thus to vote with intelligence on the adoption of new legislation.

Another plan is for a one-house legislature that shall be in session for a much longer term than at present provided, and that it shall enact laws without the conflict of views between Senate and House now so frequently the cause of de-

feat of worthy measures and the insertion of "jokers" in other laws which make their enforcement impossible, or so vitiate them that the courts declare them unconstitutional.

Governor George E. Hodges, the new chief executive of Kansas, has presented to the Legislature of that State for its consideration a yet more radical change, and advocates a constitutional amendment putting it into effect. He proposes a government of the State by a commission, similar to the commission rule now used by over three hundred cities, a list constantly increasing and including both important municipalities and villages. Governor Hodges says:

I am satisfied, after eight years service in the Senate of my own State, that our system of law-making is antiquated and inefficient. It is founded on the English Parliament with its two Houses based on the distinction between the nobility and the common people, each representing the diverse interests of these classes. No reason now exists in our States for this dual system. The present system with its biennial session where hurried action is taken on important measures and hundreds of meritorious bills are allowed to die on the calendar because of lack of time for discussion, does not make for efficiency. It is as if the head of an important department of some other "big business" should give only fifty days every two years to its management.

GOVERNOR HODGES, OF KANSAS

Who recommends the reorganization of State government on the lines of the new forms of municipal administration by commission.

I can see no good reason why the new idea of government by commission should not be adopted for the transaction of the business of the State. I believe a legislative assembly of one, or at most two, from each Congressional district, would be amply large. My judgment is that the Governor should be ex-officio a member and presiding officer of this assembly, and that it should be permitted to meet in such frequent and regular or adjourned sessions as the exigencies of the public business may demand; that their terms of office be for four or six years, and that they be paid salaries sufficient to justify them in devoting their entire time to the public business. Such a legislative assembly would not be more expensive than our present system. It would centralize responsibility and accountability, and under the check of the recall would be quickly responsive to the wishes of the people.

A legislative assembly such as I have suggested could give ample time to the consideration of every measure, not only in relation to its subject matter, but to the drafting of it in plain, concise and easily understandable language. It would be ready at any time to deal with new conditions and to provide relief in emergency cases, and, with time to inform itself about conditions, and to study the needs of the people, and of our State institutions, there seems to me to be no question but what it would be vastly more efficient than our present system, as well as vastly more economical.

It is interesting to note that while this plan of State rule by commission has been received with a smile in some quarters, it has generally been considered as embodying an idea likely some day to be put into practice.

The agitation for the short ballot, with its concentration of responsibility, and the passing of party designations on the ballots cast at the polls, are indications of the tendency of the times toward new systems of government. The consolidation of boards of control for State institutions, substituting a small board for several large ones and making the management of the commonwealth's business approach the system of the department store or the factory, is grow-

ing. It is progressive in a large sense and a symptom of the changing views of the voters regarding the functions of government. At bottom it is the result of the training in "big business" which the leading men of the nation have acquired in the past decade. They have seen how enterprises of great size, transacting more business in a month than a State handles in a year, have been made to show a large measure of efficiency thru proper organization, and have asked why the same system could not be applied to public affairs. Whether or not the new idea of State government by commission be adopted by any commonwealth, it is not improbable that in some way our present system of a two-house legislature, with its unwieldy membership and careless handling of important measures, will be modified in some way to accommodate our law-making to the modern conditions under which business of other sorts is conducted.

Abilene, Kan.

The Efficiency of Goodness

By Gerald Stanley Lee

[Mr. Lee, who edits—say rather who is *Mount Tom: An All Out of Doors Magazine*—and who has written many books, among them *The Shadow Christ, The Lost Art of Reading* and *The Voice of the Machines,* here gives fresh consideration to the old question of whether or not the Golden Rule will really work.—EDITOR.]

A letter lies before me, one out of many others asking me how the author of *The Shadow Christ,* which is a study of the religious values in suffering and self sacrifice in this world, takes the low ground that honesty is the best policy.

I know two kinds of men who believe that honesty is the best policy.

These two men use exactly the same words, "Honesty is the best policy."

One man says it.

The other man sings it.

One man is honest because it pays.

The other man is honest because he likes it.

"Honesty is the best policy" as a motive cannot be called religious, but "Honesty is the best policy" as a "Te Deum"—as something a man sings in his heart every day about God, something he sings about human nature, is religious; and believing it the way some men believe it is an act of worship.

It is like a great, gentle mass.

It is like taking softly up one's own planet and offering it to God.

Here it is—the planet. Honesty is organized in the rocks on it and in the oak trees on it and in the people. The rivers flow to the sea and the heart of man flows to God. On this one planet, at least, God is a success.

Possibly it is because many other people beside myself have been slow in clearly making this distinction between "Honesty is the best policy" as a motive and as a "Te Deum" that I have come upon so many religious men and women in the last two or three years who, in the finest spirit, have seemed to me to be doing all that they could to discourage everybody, and especially to discourage me, about the Golden Rule.

The first objection which they put forward to the Golden Rule is that it is a failure.

When I try to deal with this or try to tell them about "non-gregarious," the second objection that they put forward is that it is a success.

If they cannot discourage me with one of these rules they try to discourage me with the other.

They point to the Cross.

Some days I cannot help wondering what Christ would think if He were to come back and find people, all these good Christian people everywhere, using the Cross—the Cross of all things in the world—as an objection to the Golden Rule and to its working properly, or as a general argument against expecting anything of anybody.

I do not know that I have any philosophy about it that would be of any value to others.

I only know that I am angry all thru sometimes when I hear a certain sort of man saying and apparently proving that the Golden Rule does not work.

And I am sometimes angry at other people who are listening with me because they are not angry too.

Why are people so complacent about crosses and why are they willing to keep on having and expecting to have in this world all the good people on crosses? Why do they keep on treating these crosses year after year, century after century, in a dull, tired way, as if they had become a kind of conventionality of God's, a kind of good old Church custom, something that He and the Church by this time after two thousand years could not really expect to try to get over or improve upon?

I do not know that it is right or that it ought to be so.

I only know that the moment I see evil triumphing in this world there is one thing that that evil comes up against.

It comes up against my will.

My will, so far as it goes, is a spiritual fact.

I do not argue about it, nor do I know that I wish to justify it. I merely accept my will as it is as one spiritual fact.

I propose to know what to do with it next.

The first thing that I have done, of course, has been to find out that there are millions of other so called Christian people who have encountered this same fact that I have encountered.

There are at least some of us who stand together. Our wills are set against having any more people die on crosses in this world than can be helped. If there is any kind of skill, craftsmanship, technique, psychology, knowledge of human nature which can be brought to bear, which will keep the best people in this world not only from being, but from belonging on crosses in it, we propose to bring these things to bear. We are not willing to believe that crowds are not inclined to goodness. We are not willing to slump down on any general slovenly assumption about the world, that goodness cannot be made to work in it.

If goodness is not efficient in this world we will make it efficient.

Our reason for saying this is that we honestly glory in this world. We believe that at this moment while we are still on it, it is in the act of being a great world, that it is God's world, and in God's name we will defend its reputation.

We do not deny that it may be better spiritual etiquet, more heroic looking and may have a certain moral grace, so far as a man himself is concerned, if the world makes him suffer for being honest. But after all he is only one man, and whether he dislikes his suffering or likes it, and feels fine and spiritual over it, it is only one man's suffering.

But why is it that when the world makes a man suffer, everybody should seem always to be thinking of the man? Why does not anybody think of the world?

Is not the fact that a whole world, eternal and innumerable, is supposed to be such a mean, dishonest sort of a world that it will make a man suffer for being good a more important fact than the man's suffering is? It seems to me to be taking not lower but higher ground when one insists on believing in the race one belongs to and in believing that it is a human race that can be believed in. After two thousand years of Christ, it is a lazy, tired, anemic slander on the world to believe that it does not pay to be good in it. The man who believes it and acts as if he believed it, is today and has been from the beginning of time the supreme enemy of us all. He is guilty before heaven and before us all and in all nations of high treason to the human race. One of the next important things to do in modern religion is going to be to get all these morally dressed-up, noble-looking people who enjoy feeling how good they are because they have failed, to examine their hearts and to stop enjoying their own goodness at the expense of the reputation of the world.

Northampton, Mass.

THE NEW BOOKS

Disraeli

For absorbing interest and also for the light that it throws on English politics and on English statesmen of the mid-Victorian period, no political biography published during the last twenty years can claim a place ahead of Mr. Monypenny's second volume of the *Life of Disraeli*.[1] The first volume, published over two years ago, scarcely promised the value and interest that attach to this second instalment. In the first period of the leader's life—from 1804 to 1837—Disraeli was an adventurer, and an adventurer not only in politics — which might be excusable at a period when politics was almost a close profession reserved for the aristocratic and territorial families—but also, and much more questionably, an adventurer in social life and in finance. In those early days Disraeli seemed little troubled with political principles. Apparently he was ready to attach himself to any party that would give him the opportunity of advancement.

In the second volume, Mr. Monypenny presents Disraeli in a much more agreeable light. The first chapter opens with the beginning of Disraeli's Parliamentary career, which was to last without a break for forty years. In July, 1837, he had been elected as the colleague of Wyndham Lewis from the borough of Maidstone, and Mr. Monypenny begins Volume II with Disraeli's own account of his taking his seat in the House of Commons on November 15. There were still many struggles ahead of young Disraeli, handicapped as he was by poverty, race, and personal affectations and peculiarities, before he could become the acknowledged leader of the aristocratic party in English politics. But the period when Disraeli could be described as an adventurer was now passed. Whether he made his choice of party in the first place from political convictions, or whether he aligned himself with the Tories because this party offered a better opening for a talented young outsider than was afforded by the close oligarchy of the Whig party, Disraeli began at once to evolve a political philosophy and a set of political principles which gave respectability, depth, and stability to his party affiliations. The philosophy of Toryism has probably never been better set out than it is here given by Mr. Monypenny. He gathers much of his material for this exposition from Disraeli's two political novels — *Coningsby* and *Sybil*. The Tory idea which is expounded in *Coningsby* was undoubtedly Disraeli's permanent conception of the political principles of the party of which he was so long the leader.

For Conservatism and the Conservative party Disraeli had nothing but contempt. He differentiates clearly between Toryism and Conservatism. Toryism was to him a vital principle, embodying the responsibility of the rulers of England for the welfare of the whole nation, a principle rooted in past history when the king was the protector and father of his people. The Tory party stood for the masses, while the Whig party represented an aristocracy of privileged classes. The contest with the Stuarts, with William of Orange and with the Georges, had been a contest not for the liberty of the people as a whole, but for the privileges of the aristocracy. The Whigs were a Venetian republic, caring chiefly for their own class. The Tories were a King and Ministry caring for the nation at large, and especially looking after the welfare of the most opprest of the lower orders. The Conservatives, on the other hand, were merely a party of inaction and of opposition to all progress, a party that had neither inspiration nor ideals.

However one may regard these ideals

[1] *The Life of Benjamin Disraeli, Earl of Beaconsfield.* By William Flavelle Monypenny. Vol. II; 1837-1846. New York: The Macmillan Company. Portraits and Illustrations. Pp. ix, 421. $3.

of Toryism, it is undoubtedly true that England at the present moment is far more ready to accept the political philosophy of Disraeli than she was in the middle years of last century. To that degree Disraeli was ahead of his times. When *Coningsby* was written, the Manchester school and the political economy based on *laissez-faire* held possession of men's minds. Progress was held to be in the line of liberalism—of decreasing the amount of governmental interference with the lives of the people and of allowing the rich and strong to become more powerful and wealthy, at the expense of the poor and the weak. At the present time there is strong reaction. The process of *laissez-faire* has gone so far in England that the poor and weak are being crushed out, and the fears of the governing classes have been awakened lest the process may end in such deterioration of the masses as seriously to weaken the nation both from a military and a commercial and industrial point of view. All parties have awakened to the need of caring for the welfare of the people, and Disraeli's biography appears at a timely moment, when the exposition of his views and his philosophy is likely to add enormously to his prestige.

LADY DISRAELI

From a miniature painted in her younger years as Mrs. Wyndham Lewis, and reproduced in Monypenny's *Life of Disraeli.* (Macmillan).

The present volume of the biography carries the story only to the breach with Peel and the struggle which led to Peel's resignation in 1846. It is almost inevitable that a book which adds so much to the reputation of Disraeli should do something to diminish the exaggerated honor which has hitherto been paid to Peel. Mr. Monypenny brings out Peel's vacillations over the corn laws, and the real treachery to his party which was involved in his determination to repeal all duties on imported grain. He shows also that the Irish famine had in fact little to do with the final victory for free trade, for at the time that the corn laws were repealed Ireland was exporting wheat, altho its people were perishing for want of their accustomed crop of potatoes.

There is one point in the story of the bitter controversy between Peel and Disraeli which tells greatly in favor of Peel and which is perhaps the most discreditable incident in Disraeli's parliamentary career. This is the incident, which is related in Parker's *Life of Peel,* of Disraeli's application to Peel for office in 1841, and his subsequent denial in 1846 that he had made any such application. It was no discredit to the young politician in 1841 that, after having received much marked encouragement from Peel, he should venture to remind the new Premier of his existence. But that Disraeli should stand up in Parliament and categorically deny that he had ever written to Peel asking for preferment was an offense against House of Commons ethics that would not easily have been forgiven, and it is certainly to Peel's credit that, altho the letter must have been in his possession, he allowed the incident to be patched up with a lame apology and explanation.

One aspect of Disraeli's life that is always interesting is his marriage with Mrs. Wyndham Lewis. Mr. Monypenny manages completely to dispose of the fiction that this was purely a marriage of convenience. The mere fact that Mrs. Lewis was twelve years older than her husband is no proof that there could be no affection between the couple, and the many letters reproduced, and the account of Disraeli's devotion to his wife and of

her constant care and tenderness for her husband, prove that on this side of his nature, as well as in regard to political principles, there was greater depth and earnestness of character than earlier biographers have given him credit for. Undoubtedly the marriage with Mrs. Wyndham Lewis relieved Disraeli of much pecuniary anxiety, and gave him a more settled social position than he could probably have won otherwise for some years to come. But with Disraeli's intense confidence and belief in himself, it is unlikely that these two moderate advantages would have been sufficient to have urged him into marriage unless there had been real affection, too.

The publication of this second volume was delayed for over a year by the author's illness. The continuation of the work is in the hands of Mr. George E. Buckle, who was editor of the *Times* from the death of Thomas Chenery in 1884, until he resigned the position some months ago. Mr. Buckle is undoubtedly well fitted to carry to completion the biography begun by Mr. Monypenny; but every reader of the second volume of the *Life*—the last and greatest of Mr. Monypenny's writings—must regret the untimely ending of a career which had in it so much promise for the students of English history and biography.

The Greek Religion

Prof. Gilbert Murray is recognized as England's leading Greek scholar. He has the further distinction of being a skilful writer of English prose. Therefore, one opens with a sense of agreeable anticipation his book, *Four Stages of Greek Religion*,[1] studies based on a series of lectures delivered last spring at Columbia University.

Professor Murray's first "stage" is the religion of an early period of which we know little and guess much: the period before Homer, of which we have no literature, whether the Pelasgian or the Ægean of the islands and coasts before the Achaian conquest. It is the time of the Cretans of Minos and of the Mycenæan culture, to which Schliemann introduced us. The second period is that of the Olympian conquest and the great and beautiful Homeric gods and goddesses. Then follows the decay of faith and the search after some other way, whether by Christianity or philosophy or some one of the mysteries from the East; and the final stage is that of the last gasp of paganism under Julian.

Our author feels fully the beauty of the religion and mythology of Greece, and admirably shows how much better it was than the coarse and brutal faiths which it replaced; but even more is he imprest by the utter failure of the gods of Olympus to satisfy the moral needs of man, with the eager search for some better knowledge of the supreme over us. To him Christianity is, like Epicureanism or Mithraism or the Hermetic teachings, one of the phases of Greek religion, vastly superior to any other, and yet developing its character in the Greek language and under the Greek culture. But Professor Murray does not, like other writers on this fascinating period in the conflict of religions, tell us the story of the advent to the Roman world of the worship of Isis or Mithra or the Great Mother, confining himself mainly to the Greek sources and to the philosophic movements which lay back of these foreign importations. His whole discussion has a seriousness, a sympathy, a sense of the inner conscience of man, which gives peculiar weight to all his treatment, based as it is on human needs for support in the search after the true and right, and after purification from recognized moral failure.

Admirably has he exprest this consciousness of manifold failure:

> It had behind it the failure of the Olympian theology, the failure of the free city state, now crushed by semi-barbarian military monarchies; it lived thru the gradual realization of two other failures—the failure of human government, even when backed by the power of Rome or the wealth of Egypt, to achieve a good life for man; and lastly the failure of the great propaganda of Hellenism, in which the long-drawn effort of Greece to educate a corrupt and barbaric world seemed only to lead to the corruption or barbarization of the very ideals which it sought to spread.

Out of this welter of hopelessness in the old and wild search for new bases of hope from the religions of Egypt and

[1] *Four Stages of Greek Religion*. By Gilbert Murray, Professor of Greek in the University of Oxford. 8vo, pp. 223. New York: Columbia University Press (Lemcke & Buechner, Agents). $1.50.

Persia came the opportunity for Christianity.

It would be presumptuous for us to try to find flaws in so learned a discussion. And yet we may venture to ask a few questions. Is it quite fair, p. 69, to speak of the Zeus of Aeschylus as a figure as sublime as "the Jehovah of Job"? Does not all the poetry of Job avoid mention of Jehovah and give God the name of Shaddai? What authority have we for saying that the Apollo of Delos was originally an "Ægean matriarchal Kouros," and that while his mother was Leto, he had "no very visible father"? Certainly, the literary evidence makes Zeus her father and Here the very jealous foe of Leto. It would seem difficult to prove that the Ægean civilization was matriarchal. What evidence is there that the Palladion "consisted of two thunder-shields, one above the other, like a figure 8"? The shield itself had that shape as figured in both Egyptian and Hittite monuments. But it is a very rare thing for a profest Grecian to wander far outside Hellenism. Every student or lover of Greek culture or of the history of religion will need to read these lectures.

Ibsen's Verse

Ibsen the sociolog, Ibsen the iconoclast, has been made known to us thru Mr. Archer's translations. Ibsen the poet has scarcely been hinted at. That is why the issue of *Lyrics and Poems* and *Peer Gynt*, in verse translations, the former by the late Edward Garrett (Dutton, $1.60), the latter by R. Ellis Roberts (London: Martin Secker), are most welcome events. Let us recognize, counsels an English reviewer, that Ibsen was "fundamentally a poet, and that the temper of poetry was not always most remote when his work was most studiously denuded of poetic suggestion." As for the poems in form, they are relatively few and curiously heterogeneous:

> The headlong sweep of the verse in *Brand* and *Peer Gynt* gives place in the main to a movement more deliberate and self-conscious, at times perplexed, occasionally obscure. Many of them reached their present state, as the invaluable collations in the *Efterladte Skrifter* show, by an elaborate process of compression, and some of the most unforgettable lines and stanzas have been reached by this path. They sometimes have the simplicity we call classical, hardly ever the naïve simplicity of the genuine woodnote wild. Nevertheless, the original and enigmatic personality of the poet does disclose itself, at times with weird intensity, in these little pieces; and some expressive traits in his portrait would be less distinct, or even be wholly lost, if they did not exist.

In much of this Ibsen-poet the London *Times* reviewer finds, "concentrated and focused, that conflict of a keen sensibility to love with a haunting sense of something sinister and ensnaring in them," which in the irony evoked suggests Heine. Nor is the parallel accidental:

> When Ibsen came to Christiania in the fifties of the last century Heine was the idol of the circle in which he chiefly moved. . . . "Young Norway" found congenial inspiration in the most brilliant singer of "Young Germany."

Edward Garrett intended to render the whole of Ibsen's sixty-four poems; but this project was frustrated by his death five years ago. Fortunately his volume of Ibsen's *Lyrics and Poems* includes his translation of *Brand*—and one of his editors, Philip H. Wicksteed, adds "a penetrating study of Ibsen's poems," and an appreciation of the translator. Perhaps Garrett's crowning achievement was his version of Aase's death scene in *Peer Gynt*. Here is Mr. William Archer's rendering of the passage where Aase lies in bed waiting impatiently for her son:

> Eh, Lord God, isn't he coming?
> The time drags so wearily on.
> I cannot send a message,
> And have so much to say.
> I haven't a moment to lose now!
> So suddenly! Who'd have thought?
> Aase, if I only were certain
> I hadn't kept him too strict.

Garrett gives this, with few verbal changes, but with no slight betterment:

> Eh, Lord! is he coming never?
> It drags on day after day.
> I cannot send word, and there's ever
> So much that I wanted to say.
> Who'd ha' thought it? So sharp-like to summon
> A body! No time to be had.
> If you could but be sure, Aase woman,
> You were not too hard on the lad!

And here is one of the half-tender, half-roguish speeches of Peer:

> Nay, now we'll just sit and chatter,
> But only of that and this;
> Forget there's aught sore the matter,
> And all that is sad and amiss.
> Are you thirsty? Some drink shall I fetch you?
> What a short little bed you've got!
> Have you room to lie out and stretch you?
> I declare, it's my own old cot.
> Do ye mind how you sat beside me
> So often at evening time,
> Spread the sheepskin, and lullabied me
> With many a charm and rhyme?

To whom Aase:

> Yes, and when father was rovin',
> The beautiful game we found!
> The cot was a sledge we drove in,
> And the floor a frozen sound.

Pan-Germanism

Prof. Roland G. Usher's book on *Pan-Germanism* (Houghton, $1.75) may be thrilling history or thrilling romance, but in either case it is thrilling. An attempt is made to find a common factor in all the recent movements of international politics, and this factor is found in the craft and ambition

of Germany. The Boer War, the Moroccan affair, the virtual partition of Persia, the conquest of Tripoli, the recent troubles in the Balkans, and events even more remote are regarded as essentially stages in a great silent diplomatic struggle between the Triple Alliance of Germany, Austria and Italy and the Triple Entente of France, Great Britain and Russia, a struggle which may burst into open warfare at the first convenient opportunity.

Compared with the other Powers, Germany is almost devoid of valuable colonies. Yet few nations in Europe have a denser population or a greater need for a market and room to grow in. "Expansion is, therefore, the only alternative, for the German considers equivalent to ruin the reduction of the pressure of population by emigration, and the avoidance of overproduction by the proportionate reduction of output. For Germany to be thus forced to remain static in population and in wealth, while her neighbors continue to expand, England in her colonies, France in Morocco, Russia in Siberia and Turkestan, means that the date of her annihilation will be fixt by the rate of their growth" (pp. 6-7). Unfortunately the territory of the world is so divided up among the nations that Germany to expand must take the share that now belongs to some other nation and thus provoke the jealousy of her rivals. Thus Germany is forced to become the dominating military power of the world or relinquish her ambitions. No ethical considerations will keep this plan from being worked out even at the cost of war. Indeed, according to the Machiavelian philosophy of the author, morality and *Weltpolitik* have nothing whatever to do with each other. The whole peace movement is a result of the advantageous position in which the rivals of Germany find themselves. "It is as selfish for them to insist upon peace as it is for the Germans to demand war. . . . It merely means that the Triple Entente prefers to employ in the struggle only the economic and financial weapons in whose use they are already adepts and of which they already possess so many more than their rivals as to make the outcome of the struggle, if fought on this basis, practically positive to be in their favor."

To us, the most interesting chapter here is that on "The Significant Position of the United States." According to Professor Usher the Triple Entente is wrongly named, for the United States makes a fourth party to the group and is bound both by economic interests and political ambitions, as well as by a secret unwritten agreement made in 1897, "that in case of a war begun by Germany or Austria for the purpose of executing Pan-Germanism, the United States would promptly declare in favor of England and France and would do her utmost to assist them." This will probably be news to our readers, and we hope it will be news to Washington.

Jeffrey Farnol's New Novel

In *The Amateur Gentleman* the author of *The Broad Highway* has achieved a delightful piece of fiction which, in delicacy of literary art, perfection of style, and true humor, reminds one of Thackeray's *Virginians*. But certain passages remind one rather of Dickens; the description of Barnabas's night ride on the London Mail recalls the trip of Pecksniff to the metropolis just as much as the allusions to the Beau Brummel set of fashionable "bucks" and "Corinthians" who frequented White's and Brook's in London recall the young Virginian's entrance into metropolitan life.

Yet this book is wholly original and Mr. Farnol's eighteenth century diction does not seem in the least affected. The writer has the leisurely charm of De Morgan without his digressions. Barnabas Barty, the hero, is the son of an English tavern keeper and retired prize fighter. He falls heir to a large fortune and decides to go to London and study to be a gentleman. Adventures befall so thick and fast that 168 pages are given up to the narration of his first day's journey, and the reader is amused and interested every minute. There is nothing melodramatic in the episodes or artificial in the quaint literary style which is most artistic and delightful. The author is so wrapped in the atmosphere of the lines that there are no jarring notes. The novel is of a very high order. (Little, Brown & Co.)

The Story of Panama

Now that Panama is being visited by thousands of tourists the demand for books on the subject is producing an abundant supply. *Panama: Past and Present,* by Farnham Bishop (Century) is the latest (1913) and shortest (271 pages) and cheapest (75 cents) and—we are pretty safe in saying tho we can't prove it—the most interesting. It is written primarily for boys but will be read with profit by their elders, for it contains as much information as more bulky and pretentious volumes and handles it so easily that the reader will not suspect, or, perhaps, appreciate, how much he is learning. It covers the whole history of Panama from Columbus to Goethals, that is from 1502 to 1912, and gives a graphic

account of life in the Canal Zone. The pictures are mostly unfamiliar and have been selected with unusual care to illustrate the romantic history of the Isthmus.

The Story of Panama, by Frank A. Gause and Charles Carl Carr (Silver, Burdett & Co., $1.50) treats the subject more seriously than the preceding book and comes more closely into competition with other works on Panama now on the market; its chief difference from its rivals being a more detailed description of the various departments of Canal Zone Government, soon to disappear. The authors, superintendent and high-school principal in the Zone school, are more successful in describing present conditions as they have known them than in the historical portions of their book.

From Harper's Magazine, by special permiss on of the publishers.

SURVEYING FOR THE PANAMA RAILROAD IN 1850
(From Bishop's "Panama, Past and Present," Century.)

The Spirit of Ireland

Where, in Irish literature, is the true spirit of Ireland to be found? It is a question which no Irishman will answer to your complete satisfaction. One will tell you that Lever and Lover are the writers for his money. The next that these two were clowns who invented the stage Irishman, and that Carleton's studies of the Irish peasantry are the only true portrayals. While yet another will send you to the wistful Celtic wailings and fairy imagery of the Yeats school, and for humor to John Synge and Lady Gregory, with impatient scorn of the sentimentality of George Moore.

The truth is, that only by studying all of those schools of writing, can one get an idea of the composite character of the Irishman. He is full of surprises, and is not to be thrust into any single pigeon hole in the bureau of national characteristics.

In *A Loyal Love* (Badger, 75 cents) Eleanor Atkinson tells the love story of the Irish patriot, Robert Emmet, and Sarah Curran, daughter of the brilliant Dublin barrister. It is a simple tale without adornment, but so poignant with tragedy that it makes a strong appeal to the emotions. It has true simplicity and directness, and makes no attempt to gain the sympathy of the reader by meretricious writing or false sentimentality. We can heartily recommend this little book.

An exhilarating romance of the Irish hunting field, full of good humor and witty to a degree is *Dan Russell the Fox* (Doran, $1.25), by E. Œ. Somerville and Martin Ross. The writers know every inch of the country they are writing about, are fine judges of horses and dogs, and have a genuine talent for character drawing. An English woman who discovers that she knew nothing of life till she learned to follow the hounds, a charming Irish widow with the spirit of ten adventuresses, a squireen who is more at home with his hounds than in drawing rooms, a supereducated author, and a wealthy army cub, are the personages on whom Cupid plays his merriest pranks. The freshness and verve with which the story

moves along is irresistible. This is the spirit of Ireland in happy mood.

Another hunting story which falls far short of Somerville and Ross is *The Arrival of Antony,* by Dorothea Conyers (Dutton, $1.35). In comparison it rings false, tho the author has taken pains to elaborate her studies of Irish life in all stages. But the spirit is lacking and the interest flags. Nor has the author learned that there is no need to adopt Mr. Dooley's misspelling to convey the delightful qualities of Irish talk.

G. A. Birmingham (Canon Hannay) is an Irish writer who has come rapidly to the front, a churchman with a fund of irresistible humor and boyish high spirits. His *The Red Hand of Ulster* (Doran, $1.20) will be responsible for a perpetual smile and alarming chuckles in many households. This account of an attempt to oppose Home Rule, financed by an Irish-American millionaire, written in a spirit of farce, and chronicled (supposedly) by a weary Irish peer, is crammed with diverting episodes and bright moments. This mellow churchman could draw tears of mirth from the eyes of a potato.

Literary Notes

Navigation for the Amateur is a subject on which the amount of available literature is limited and we welcome a manual with this title by Capt. E. T. Morton, illustrated with diagrams (Outing Publishing Company, 70 cents).

Economic and Moral Aspects of the Liquor Business, by Robert Bagnell, is an attempt to study the liquor problem from a social standpoint (pp. 178; 75 cents) and is more concerned with principles than with specific instances (Funk & Wagnalls).

The translation of Strindberg's *There Are Crimes and Crimes,* by Edward Bjorkman, published by the Messrs. Scribner, is now in rehearsal by the Abbey Theater Company in Dublin.

August Strindberg's irony found expression in the title of his fantastic drama of the pursuit of happiness, *Lucky Pehr.* This mad piece of symbolism is a challenge to the translator, yet Mrs. Velma Swanston Howard has succeeded fairly well except with the verse. Cincinnati: Stewart & Kidd Company, $1.50.)

Rather rhapsodical is *Memory and the Executive Mind,* and suited to the emotional man who needs stimulus to make him work. Full of obviously good things, related with rather too much hysterical emphasis and too many words printed in capitals. (Chicago: M. A. Donahue.)

Very useful and interesting, and needful, is Prof. J. R. H. Moore's *An Industrial History of the American People* (Macmillan). It is a textbook for high schools, but the general reader will profit if he makes of it a supplemental history reading.

Prof. Henry C. Sheldon, of Boston University, gives in *Rudolf Eucken's Message to Our Age* (Eaton & Mains, 35 cents) a brief and fair-minded exposition of his fundamental ideas with some criticism for his deviation from the orthodox standards.

A scholarly study of the *Cotton Manufacturing Industry in the United States,* by Dr. Melvin Thomas Copeland, is published by Harvard University as a contribution to Harvard Economic Studies (pp. xii, 415; $2). This Wells Prize essay studies conditions in England and the United States.

Mr. N. C. Fowler, Jr., stands ready to tell all of you who wish to know *How to Get Your Pay Raised.* "When you have done your best you are a man of marked success," says our author; and that is the conclusion of the whole matter, stated at the end of chapter one. (McClurg.)

How to Invest When Prices Are Rising is a collection of papers by university lecturers, editors, etc., with an introduction by Prof. Irving Fisher, of Yale. The sub-title, "A Scientific Method of Providing for the Increasing Cost of Living," indicates the intention of the authors. (Scranton, Pa.: G. Lynn Sumner & Co.)

The Day of the Saxon, by the late Homer Lea, author of *The Valor of Ignorance,* is a pseudo-philosophical consideration of international war from the extreme militarist viewpoint, with cocksure prophecies of the impending doom of the Saxon race. Somber, suggestive and sententious. (Harper, $1.80.)

Patsy, by S. R. Crockett (Macmillan), is a story that does not leave a bad taste in the mouth of the reader—a story of love and adventure among the picturesque people of the Scottish coast, when they were smugglers and the press gang was abroad. Patsy was a dear, and as daring as any of the lads who were breaking the laws of England; and her adventures make a tale well worth reading.

Mr. William Ganson Rose essays to tell his readers "how to achieve success in business," and says that success in business involves "the goal, character, knowledge and power" (*Success in Business,* Duffield). In telling how to become successful he uses many short paragraphs and many capital letters where capital letters are not required. We think some men would profit by reading this book.

Among the publications announced by John W. Luce & Co., the Boston publishers, are *Marriages,* a novel by August Strindberg, and a second volume of Strindberg's *Plays; Chains* and *Hindle Wakes,* English plays by Elizabeth Baker and Stanley Houghton, respectively; the dramatization of his novel *Esther Waters,* by George Moore, and two plays by Lennox Robinson, manager of the Abbey Theater Company.

Prof. Robert Herrick's latest novel (*One Woman's Life,* Macmillan) is more readable

A KONGO CHIEF AND HIS WIVES
From Harris's "Dawn in Darkest Africa" (Dutton).

than some of its predecessors. The one woman was not remarkable in anything, nor did she have a remarkable life; but this unremarkable career is recorded in a rather remarkable manner. Milly takes tribute from all who come in her way, rather sordidly and quite heartlessly, worries her first husband into a premature grave, and on the last page goes blithely off to California with her second. What the lesson of her life may be is the riddle of the book.

Those of us who can remember reading with delight, as boys, Henry M. Stanley's stirring account of his travels, adventures and discoveries in Central Africa, will welcome this reprint by Charles Scribner's Sons of *How I Found Livingstone* ($2). It has reproductions of all the familiar woodcuts of the first edition published in 1874, and the younger generation of readers who have not read these fascinating chapters of Stanley's actual experiences in African wilds, have a pleasure in store for them. This edition commemorates the centenary of Dr. Livingstone's birth.

Master Mariners, by John R. Sears, is a volume in the Home University Library of Modern Knowledge, issued by Henry Holt & Co. It begins with the attempt made by Necho II to dig his way thru the Isthmus of Suez, with a view to handling the big stick along the coast of two seas, and, incidentally, something in the way of trade. The story leads on, until we see the ambitious trader's eye fixed on the Panama Canal. The sailor's kit and the trader's box have been the great civilizers. It is a pretty story, full of incident, and well told. Every boy should have it in his bedroom library.

Missionaries have always been the chief contributors to anthropology because their intimate and continuous association with native life gives them opportunities for study that the trader, the soldier and the scientist do not have. *Dawn in Darkest Africa* (Dutton, $3.50) is of especial value

from this standpoint because the author, John H. Harris, considers not only the African of today but also his prospects for the future when the continent is divided up among the European Powers and its resources developed. The region he is especially concerned with, Kongo and Nigeria, bristles with problems, political, social and economic, but the author discusses them with a coolness and good sense that wins the commendation of Lord Cromer, who writes the introduction.

One often hears people say, "Yes, I should like to read French," or, "Yes, I wish my daughter read French," with the qualifying addition: "But when you open a French novel you can't tell what improprieties you may be confronted with before you are safely out of it!"

A French guide to French biographies, novels, plays and periodicals that are altogether *jeune fille* (to translate: wholly proper for the adolescent) is presented in the monthly publication called *Romans-Revue*, publisht at 5, rue St. Pierre, Lille. Protestant readers may, to be sure, object to the strongly clerical flavor of the review, which is directed by the Abbé Louis Béthléem; but the sentiment is at least as highly moral as it is Roman Catholic. A classification of contemporary literature is made according to whether the work under consideration is "bad or dangerous," suitable only for grown-ups, or "for all ages." Thus H. G. Wells's *Ann Veronica* is wholly taboo; Blasco-Ibanez's *Crowd* is "dangerous." A certain number of works of science and philosophy are, from time to time, reviewed. Thus a recent issue classifies the work of Fabre, "the Homer of the insects," as a valuable contribution to the literature of nature; regretting, all the same that this later Homer never mentions the name of God—never anything more than "the sovereign pilot."

James Milne, a British journalist, has taken a hasty scamper thru America and Canada. It was a journey insisted upon by his future wife, who wanted to make sure that her lover had made his choice of a companion for all time and would not make married life miserable by sighing for belles of other climes. The frame of mind in which Mr. Milne made his observations is touched, therefore, with sentimental color, and he contrives to insert a tiresome amount of musing upon various subjects which have little to do with the object of *John Jonathan & Company* (Macmillan, $1.60). There is nothing startlingly new about the author's superficial views on America and the Americans, or on Canada, but they are set down crisply.

The untaught country girl, possessed of most of the virtues and all of the graces and attractive qualities of the most sophisticated, has always been a favorite with novelists. *Joyful Heatherby*, by Payne Erskine (Little, Brown, $1.35), is one of these country girls, and she is made more and more charming as the tale develops. The hero begins tamely, almost badly, but suddenly acquires the qualities missed at first, and in the end is made worthy of the maid. The story is gyroscopic—it whirls about with apparent recklessness, getting the girl into many difficulties—but is in accord with the fictional law that all must end well.

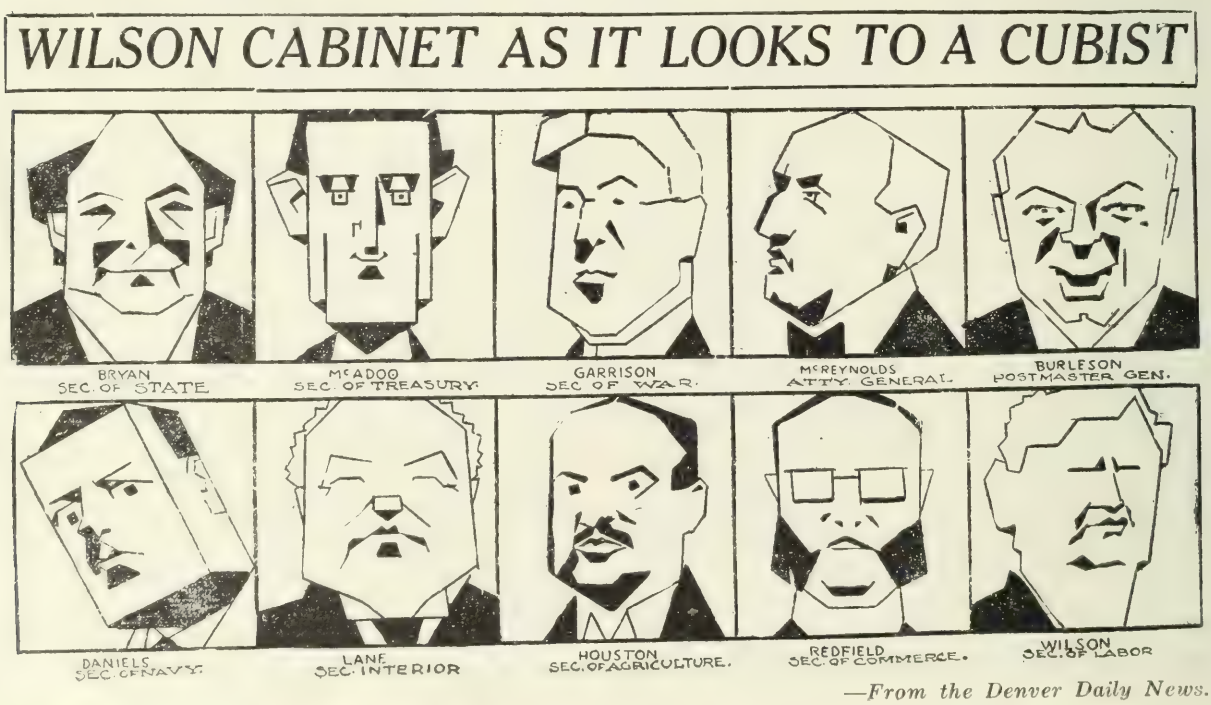
Six more volumes of the complete edition of the works of Sir Gilbert Parker, which the Scribners are bringing out, gives us ten volumes. These contain some of Parker's best work, and some that we are not as well acquainted with. We think of him as the expositor of French Canada, but here is a volume devoted to his Australian stories, *Cumner's Son, and Other South Sea Folk*. Here we have, too, *When Valmond Came to Pontiac*, the best of the author's stories about Canada. *The Pomp of the Lavillettes* has half of a volume—another of the good Canadian tales. There are here eight tales that originally formed volumes, and there is one book that has several short stories. Then there is, too, *The Seats of the Mighty*, and *The Battle of the Strong*. The author writes an introduction for each volume, which is not the least interesting part of it. These handsome books, placed beside the four first, give us a better idea of the pleasing dignity of the set.

Sir Gilbert Parker's latest book, *The Judgment House*, published by Harper, is quite different from those that made his fame, inasmuch as it is a dramatic study of a woman of the English conventional life rather than a picture of life as lived by unconventional society. It is not eventually erotic, tho it comes perilously near. It is a notably strong piece of work on one side, and rather weak on another side. If all of the contemplative and expository pages could be cut out, the story would be sweeping, absorbing drama, scarcely lacking the theater properties and stage setting. It traces the development of a lovely and heartless girl thru the several stages to the goal of the true woman, and in doing so goes into and over an interesting field—that crucial time for England covered by Jameson's raid upon Johannesburg and the fall of Kruger.

Fifty Years Ago

From **The Independent**, April 2, 1863

OUR WASHINGTON CORRESPONDENCE



To the Editors of THE INDEPENDENT:

The changed feeling in Washington within a month, in reference to the war, is almost miraculous. A month ago, there was a very general depression and gloom in official circles. Your correspondent has been absent a few days from the national capital, and upon his return is agreeably surprised to find that the shadows have moved off from the surface of affairs, and that in their place now lies the unbroken sunshine of a firmer confidence in the ability of the loyal people of this country to extinguish the rebellion. One cannot move among the departments of the Government at any hour of the day without perceiving that a new spirit animates every official he meets. There is a most obstinate conviction that we are going to triumph in this contest with the rebels and the Copperheads.

If one stops a moment to chat with the President's affable Secretaries, Messrs. Nicolay and Hay, he will perceive at once that they are much more confident and hopeful than they were last winter. If Mr. Lincoln is seen, the happy smile upon his bare face shows that he begins to feel himself master of the situation. He feels more sure than ever before that the war can have but one termination—the subjugation of the rebels and the abolition of slavery; or, to use his favorite word, the "abolishment" of the cause of the war. Passing along the paved walk which leads from the Presidential mansion to the War Department, one meets a stray senator who yet lingers in Washington, or a representative of the last Congress—hopeful, and perhaps radiant with smiles. In the War Department, Mr. Stanton is as busy, noisy, demonstrative as ever, but even he, who in the darkest hours was in his outward behavior bold and, as some think, domineering, has an air of unusual confidence. He is monarch within the range of his voice, at least, and it will reach a great distance. He possesses one good quality at least: that of boldness and intrepidity.

At the Treasury Department, as a matter of course, everything wears a sunny aspect. How could it be otherwise? In point of fact, the cause of the feeling of confidence at the other departments lies here in the office of the Secretary of the Treasury. It is Mr. Chase's success in his financial plans which has dispersed the gloomy clouds of one month ago, and given us a clear sky today. Mr. Forney tells in his *Chronicle* of meeting an old Democrat in New York, one of his pro-slavery associates in past years, who has been something of a Copperhead during the past winter, but who has been converted into a stanch Unionist simply by Mr. Chase's success in driving down the premium upon gold. His management of the national finances has had a similar effect upon a large class of people in all the free States. The moment they begin to see that the Government is going to triumph in the controversy with the rebels, they give their sympathies to it, for they have always believed in belonging to the strongest side. D. W. BARTLETT.

Washington, March 30, 1863.

SURVEY of the WORLD

Arctic Industries

It may not be generally known that important mining operations are carried on within the Arctic Circle. Cryolite is sent from Greenland by the shipload to be used in the manufacture of candles. At Alten, near the North Cape in Finmark, extensive copper mines have been worked for a long time.

When it is remembered that most of the work must be done under ground, and that heat is what the workmen suffer most from, it becomes apparent at once that mines may be almost as profitable in those latitudes as they would be on our own coast. The main thing is to have communication open once a year for bringing supplies and carrying away the ores.

An engineer who not long ago visited the mines at Alten to study the conditions under which they were worked reported that the climate interposed no obstacle. The mines, when fairly deep, are warmer in winter than in summer.

In such work as has to be done above ground, there is scarcely any interruption. During the three dark months, when the sun does not shine, there is no lack of light to the eye accustomed to the conditions.

The sky is clear and starry, and Aurora is playing most of the time, and whatever light there is the reflection from the snow increases and intensifies.

More than 160 years ago mining was carried on extensively about the shores of the White Sea by Saxon workmen. Silver, copper and lead were produced in quantities.

Now that the whale fishery has declined, mining enterprise seems most likely to promote settlement within the Arctic Circle.

The Influence of Alcohol on the Unborn

It has been known for some time that eggs of fish do not develop normally when alcohol is added to the water; and it has been suspected that the frequent association of alcoholism in the father and epilepsy and feeble-mindedness in the children was a causal one. This subject has been studied experimentally on guinea pigs by Dr. Charles R. Stockard, of New York, who has made some of them breathe fumes of alcohol for an hour a day. The stock that had not breathed produced only healthy young that developed normally. But when guinea pigs that had long been intoxicated by alcohol were used as fathers with normal mothers, eight out of twenty offspring were still born, seven died soon after birth, and of the five that survived only one grew at the normal rate. When the mothers only were intoxicated the result was not quite so bad; and when both parents were alcoholics most young aborted, many were still born and not one survived infancy.

The worst fate befell the progeny of two drunken guinea pigs, the next worst the progeny of a drunken father; those of drunken mothers were less affected, but were terribly weakened. Since the human child develops in the same relation to the mother as the young guinea pig does the danger to the children of alcoholics is evident.

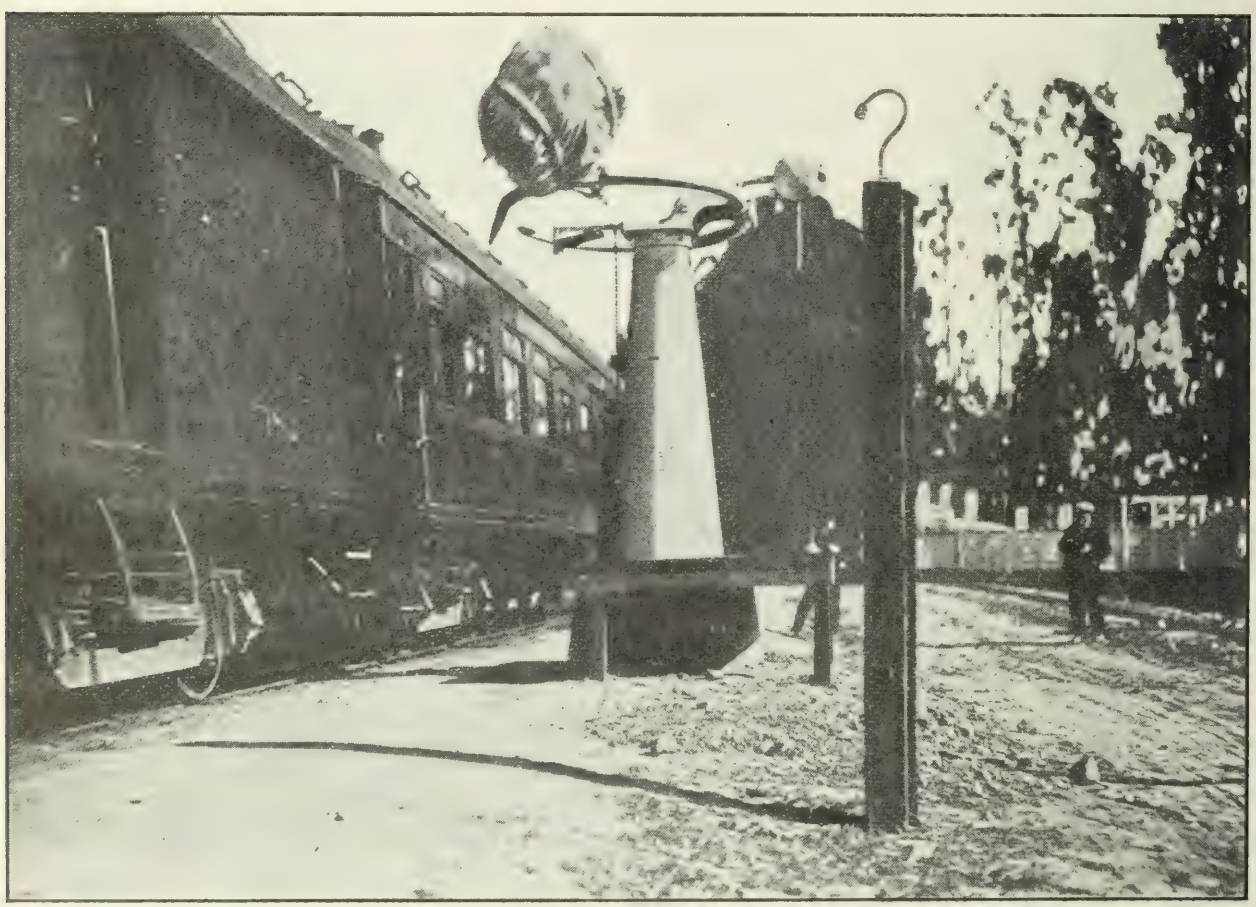
Director of the Carnegie Station for Experimental Evolution.

Taking Mail at 60 Miles per Hour

While William H. Jones was postmaster at the small town of Iola, Idaho, he noticed the crude manner in which mail was snatched by the rapidly moving trains from rough iron mail-delivering standards and realized the danger arising from the throwing of mail bags from the trains to the platforms. For three years he worked on a new arrangement which has now taken shape as Jones' Mail Exchange Device, with which it is possible to take on and put off mail from the mail car while it is traveling at a rate of sixty miles an hour.

It is possible to do more than that. During demonstrations held recently, four cases of eggs were packed into one of the large mail-exchange sacks, transferred from a train traveling at fifty-five miles per hour to the stationary standard, and later picked up by the train again at a similar speed. Instead of finding an eggnog, the demonstrators discovered upon opening the exchange sack that not one egg in the four cases had been broken.

The tests made recently of this dispatcher were entirely successful, and as a result it has been sanctioned by the United States



Government and adopted by the Southern Pacific Railway Company, which is now installing the exchanger on its entire southern coast division, from Los Angeles to San Francisco.

The device consists of a cylindrical standard, about fifteen feet in hight, planted in a bed of several feet of cement. Resting in a cradle on the top of the crane or standard is a pair of horns which make a circle of about eight feet, the fingers being on the side of the standard nearest the tracks. The points of the horns overlap about four feet and each horn is jointed at the point where it starts to overlap, so that it may be turned back out of the way when not in use. One finger of the horn points up and the other down the track. Below the horns on the side nearest the track is the delivery arm.

Along the roof of the mail car, over the centers of the doors, running from one side of the car to the other, is a track from which hangs a steel carriage, with a delivery arm at either end.

When the mail clerk in the car wishes to prepare a sack for delivery he secures one of the especially prepared rings and attaches it to the sack, later putting it on the delivery arm. Upon approaching the station he pushes the carriage along the track and out of the door of the car. This movement, in addition to latching the delivery arm, sets the receiver hook in position. While the clerk is doing this the agent at the station fastens a delivery arm of the standard, the horns at this time being horizontal. The finger of the horn which is not to be used in the transaction he then turns back so that it will not be in the way.

The exchange is made in an instant. The point of the catcher hook on the car passes thru the ring on the bag suspended on the delivery arm of the standard, thus dragging the sack from the standard and depositing it on the floor of the car. At the same instant the horn of the standard passes thru the ring hanging from the delivery arm of the car, and this ring with the bag attached swings around the horn to the back of the standard. The weight of the bag, assisted by a heavy iron ball on the back of the standard, causes the horns to tip backward so that the points are thrown up safely out of the way of any passing train, as the railway department of the Government requires. It takes but a moment to prepare either the standard or the carriage in the car for the transaction, and the device eliminates the rough handling of the mail and also the danger of the old method of exchanging the pouches. The

THE JONES MAIL EXCHANGE DEVICE IN SERVICE
The mail bag has just been received from the moving train.

Southern Pacific Company will extend the new mail exchange system as rapidly as practical to all sections of its lines.

How the Squirrel Came by His Thrift

Winter in our northern climate presents a serious problem to the large class of small animals—mainly rodents—whose food is vegetable. At this season green things are wilted or buried under snow, and roots are practically inaccessible. Nevertheless, many small mammals, such as the mice and ground-squirrels, manage to survive when it would seem as tho starvation were inevitable; and so it would be were not these animals able either to suspend life during the cold season, by hibernation, or to procure and store in advance sufficient food to sustain them until the revival of vegetation in the spring. While some do become dormant, or like the rabbits brave the winter on a diet of natural hay and bark, the majority of the mice, the spermophiles and most squirrels, gather and save provender for the winter, usually stored where it can be obtained as needed, without going out of doors.

I do not remember ever to have seen in the writings of any evolutionist an explanation of the rise of this prudent habit, which has now the force of instinct, yet it seems to me an excellent example of a beneficial custom produced by natural selection. Most of the higher animals take their food to their homes, or lairs, when circumstances favor, and there devour it at leisure, or share it with their families. This is particularly true of such timid creatures as the rodents, which are accustomed to seize their food and carry it to the security of some hole or high perch, and there eat it in peace, some being provided with pocket-like cheeks in order to transport a large quantity at once from a dangerous gathering-place to one where it may be chewed and swallowed in leisurely security.

Accident, and the acquisitiveness characteristic of many small creatures, would lead to an accumulation of half-eaten or untouched edibles about such places, and this would be increased in the autumn when seeds and nuts are ripe and every weed and bush offers a tempting abundance, leading the animals to gather much more than is necessary to satisfy their immediate need. Such a surplus and somewhat accidental accumulation would be untouched as long as the weather remained good, and there was plenty of fresh food outside, but it would be resorted to when cold and hunger assailed them. Those individuals or families which had thus unintentionally gathered and saved the most would withstand long storms and stresses better than others, even to surviving when their fellows had succumbed. Thus the beneficial habit of acquisitiveness—the tendency to collect and keep food in the autumn—would be steadily born into more and more young, and grow in force until it became a protective instinct of the race.

ERNEST INGERSOLL.

Buying Coal Scientifically

A Government official was once delegated to inspect a carload of coal for federal use. He was not a fuel expert. Legend has it that he reported that the coal "was black and would burn."

This little incident is indicative of the careless way in which the general public has in the past and is now buying its coal. How much heat coal will make is entirely disregarded, yet coal is bought only for the heat it generates.

Uncle Sam has discarded the hit-and-miss system of coal buying. He has gone in for heat. Black piles of plain coal no longer interest him.

The commercial world or the individual still sleeps. Fact is it is only lately that the public has taken the precaution of weighing the coal it purchases. Many buyers of this day foolishly accept the seller's weight, which is very apt to be something far below what is billed out.

Now that Uncle Sam has made a success, and this means a saving, in buying scientifically, it certainly behooves his less prosperous nephews to benefit from his lesson in economy.

Last year the Government undertook its first general experiment in buying coal under the British thermal unit system, a plan that is wholly practicable for the commercial world or the average citizen. And buying *heat* beats just buying *coal.*

British thermal unit buying should not be difficult to comprehend. Thermal means heat, to warm. Therefore, a thermal unit is a unit of heating value. The world has adopted the British standard of a calorific unit. In general, the unit consists of a specified degree of heat from a given quantity of coal. Thus, if a dealer guarantees a ton of coal to produce 1500 B. T. Units, and an analysis of a small sample shows only 1000 units to the ton, the consumer stands to lose 500 units of heat, representing a third of the heating value. Under the Government system coal contractors guarantee coal to generate a specified number of units to the ton. Deductions are made for a decrease in units as shown by tests

made by the Bureau of Mines from samples sent it. On the other hand if the heat units guaranteed are exceeded the contractor gets a premium. Savings are also often made by the Government in ash and moisture content. The contractor guarantees a certain percentage of ash and moisture. Any deviation from the guarantee results in a deduction or increase in the price to be paid. By this system both the dealer and the consumer get a square deal. But the dealer, for reasons that are obvious, prefers to sell coal rather than heat.

Cases have been known in the Government service where deductions have been made under all three factors, and in one instance a saving of $1000 was effected in a $3000 delivery.

There are many commercial concerns which buy annually more coal than any of the Government's leading departments or bureaus. Few, if any, of these organizations have thought to adopt the sensible system of buying heat instead of mere coal mined from a certain mine and presumed to have special calorific merits because it comes from a rich vein.

Many people believe that wetting coal gives it better heating qualities. Water makes coal heavier, but lessens its heating value.

In every city there are commercial chemists prepared to make the analysis necessary to determine the number of thermal units in a sample of coal. If buyers were to unite and demand that retailers guarantee their product to produce a specified amount of heat registered in thermal units, and then periodically have the analysis of the retailer checked up by some reputable chemist, there would be a marked saving in coal bills. An honest dealer should be glad to do this.

Large buyers of coal, especially factories, will find a big saving in this method. But the individual buyer, saturated with the American spirit of waste, cannot be expected to go to trouble that will net him a dollar or two in savings on a ton of coal. Because of this either the federal, state or municipal governments might well enact laws to compel dealers to sell coal on a basis of heating units involved. Such a plan is feasible, especially with a Bureau of Mines and a Department of Weights and Measures, with expert inspectors, at hand to enforce such legislation.

There are few dealers who do not know the exact heating values of their coals as shown by careful tests. It is plainly up to the buyer to see that he pays for heating value only. The thing to do is to follow Uncle Sam's suit. He is playing a winning hand at coal buying. The thing to do is not to get frightened at the scientific significance of the British thermal unit. Let the chemists worry making the tests. Determining the value of the coal after the units it will generate become known is a simple problem. The thing to do is to make it possible, by legislation or coöperative buying on a large scale. There's satisfaction in getting what you want; and what you want in buying coal is *heat*,—not waste dirt, and useless moisture, and mountains of ash.

Guarding an Emperor

We have a fairly good notion of the precautions taken by our Secret Service to protect the President and other important officers in this country; but few Americans have any idea whatever of the extraordinary steps taken in a like direction to protect foreign rulers. The following will serve to show how the German Emperor is looked after, even when he travels a very short distance.

During what did not seem to be a very perilous passage from Homburg to Cronberg on the part of the Kaiser, trotting orderlies went up and down the road. Soldiers were stationed at intervals. Pedestrians on the way to Cronberg were turned back. Travelers by carriage were examined, and allowed to proceed if they proved to harbor no nefarious designs.

The Imperial equipage passed at night. First there came a mounted escort, then soldiers on foot. Five minutes later more mounted men appeared; and then what seemed to be intoxicated motor cyclists, swaying from side to side; but these men were merely swooping from one side of the road to the other, and scanning the ground by the light of their vivid acetylene lamps. They were looking for bombs.

Behind the motor cyclists were other mounted soldiers, and then came the royal conveyance. It passed in a flash of light, not only from the speed it was maintaining, but because of a huge electric light hung at the end of the pole. This served a double purpose. It illuminated the way, and also shone so brightly that the eyes of any assassin would have been so dazzled by it that he could hardly have got a correct aim.

Where They Make the Most of the "Movies"

"I am immortal!" cried Madame Sarah Bernhardt, "I am a film!"

The enthusiasm of the great French actress after performing before a moving picture camera may not have been due altogeth-

er to a feeling that she had put her gestures on record for all time. Some of her satisfaction at being a film could well be regarded as a reflection of the universal French enthusiasm for the cinematograph. It might be thought that the United States is the picture-mad nation of the world, but even New York and Chicago are lukewarm in interest in this regard as compared with the metropolis of France. The very tiniest quarters of Paris have their picture shows, all of them lasting longer and more elaborately stage-managed than the average American "movies," and all taken with the intensest sort of gaiety or seriousness. The rich Parisian sits in a box in as much style as he pleases, refreshing himself with champagne at ten cents the cup; the poor man sees a ten-cent show with a glass of "bock" as a premium. And the best actors and actresses of the nation are among the performers.

THE "KING OF THE CINEMAS" ON THE GRAND BOULEVARD, PARIS

The French have, indeed, made the "cinema" as honored a form of entertainment as vaudeville or the "legitimate"—a three-hour show, with overture and accompaniments by a complete orchestra, rung up with a curtain as if it were a drama and played to a house where seats are sold by "class" or reservations. Even in the poorest quarters of the city "general admission" rarely is less than ten cents, while the choicest sections are reserved for twenty to forty cents and the neat little booklet program costs two cents more.

An American visitor's surprises begin when after entering a place that looks much like the home brand of "movie" on the outside, he takes a seat and is stared at for removing his hat. The custom of "the world's center of histrionic art" is that men may wear hats, but women must leave theirs with the check-room lady. Another interesting Parisian ruling for the picture shows is that you may bring along your dogs—and it isn't rare to hear them raising plaintive yowls at the violin music—but that babies are taboo. Also, the well-regulated boulevard cinema advertises its progressiveness by having tea-room and buffet supplements.

What the Parisian boulevard cinema house may give in an afternoon or an evening bill of three hours may best be appreciated by a glance at some such sample program as the following:

PROGRAM.

1. Overture.
   Rondeau-Caprice (violin solo).....Damare
2. Orchestra.
   Danse des Satyres .....Lincke
3. Travel Picture—"Corners of Brittany."
4. News Picture—"Burgess Swimming the Channel."
5. Art Film Drama—"Mardi-Gras."
   (Played by three actors of Sarah Bernhardt's Theater.)
6. Comedy Film—"The Effects of Music."
   (Intermission.)
7. Overture.
   Le Jeune Henry.....Mehul
8. Orchestra.
   Marche Mexicaine .....Nossam
9. Travel Picture—"From Amsterdam to Rotterdam."
10. News Picture—"Duck Hunting in an Aeroplane."
11. Film Drama—"The Scare."
12. News of the Week in Motion Pictures.
13. Pathos Film—"The New Servant."
14. Comedy Film—"The Tailor Pretends He is Paid."

At the largest of the Parisian houses, the Gaumont Palace in Montmartre—on special

occasions it can seat 8000—"speaking films" have been the great attraction. These pictures operate synchronously with phonograph records. Color films are a specialty in several other houses, while a few along the Grand Boulevards make particular features of history and travel reels, or melodrama, or comedy. Most of the large Parisian "cinemas" are as dazzling with paint and terra cotta decorations and flaring arc lights outside as the gaudiest of the American "movies." Many are well lighted inside, too, and this thruout the performance. The pictures are projected into a black-framed or black-draped screen that makes the spectator think he is seeing the actors or scenery thru a huge window. An extremely simple device effects this: all the incandescent globes in the auditorium are blackened on one side so they cannot throw light in the direction of the screen.

The French are as fond of American films as Americans are of the best of the French products. Particularly does Paris dote on the Wild West drama; and an announcement of a reel with such a label as "The Sioux Indians in Iowa" will lure as much extra attendance to the show as a well-advertised Parisian Apache play would draw in New York.

The Cost of Industrial Accidents

An idea of the enormous cost of industrial accidents can be gained from figures compiled by the Industrial Commission of Wisconsin. According to the law organizing this board and defining its duties, it was provided that all employers in the State, employing more than three people, the State, each city, town, village and school district, must report to the commission all accidents occasioning a disability of more than seven days.

This law went into effect September 1, 1911. During the first twelve months a total of 6641 accidents were reported.

Section 2394-9 of the statute relating to the compensation of injured employees provides for compensation payable as follows:

> Sixty-five per cent of the weekly loss in wages during the period of disability. The payments to be made weekly, provided that the weekly indemnity due on the eighth day after the employee leaves work as the result of the injury may be withheld until the twenty-ninth day after he so leaves work. If recovery from the disability shall then have occurred, such first weekly indemnity shall not be recoverable; if the disability still continues, it shall be added to the weekly indemnity due on the said twenty-ninth day.

During the year there were 1215 cases settled according to the provisions of this act, with a lump sum compensation of $63,432.90; an average cost of $52.21 per case. This represents the amount paid as compensation to the average injured employee. It does not, however, represent the actual cost of the accident.

This cost can be derived as follows: $52.21 represents 65 per cent of the average yearly earnings lost by the injured, 100 per cent is $80.32. In about 60 per cent of the cases settled the disability did not exceed twenty-nine days, and therefore to get the actual loss it is necessary to add one week's average wages to the amount above, in 60 per cent of the cases. Assuming an average weekly wage to be $10.50, the wages lost in an average accident case would amount to $86.62. For the 6641 accidents reported during the year the total cost amounts to $575,243.42.

Even this seemingly large sum, however, does not represent the entire cost of all industrial accidents. It does not include a single accident to railway employees, as accident reports were not required from railroad officials the past year. During the first four or five months of the operation of the act employers were not familiar with the law in regard to reporting accidents, and consequently many were not reported. Then, too, only accidents causing a disability of more than seven days are reported, while there are from three to five times as many involving a shorter period.

From these facts it may be safely concluded that the total cost of industrial accidents in Wisconsin alone is very close to $1,000,000 each year.

Of far greater importance in the field of accident prevention is the horrible loss of life and limb caused by these accidents, as shown in the accompanying table; losses no amount of money can ever make good. The figures speak for themselves:

Total accidents		6641
Fatal		141
Permanent injuries		541
Loss of one hand	27	
Loss of two hands	2	
Loss of foot	3	
Loss of leg	5	
Loss of eyes	16	
Loss of one arm	15	
Loss of two arms	1	
Loss of fingers	452	
Loss of toes	9	
Internal injury	7	
Impaired sight	4	
Temporary injuries		5959
Fractures	870	
Bruises	1899	
Lacerations and cuts	1850	
Sprains	538	
Burns	465	
Injured eyes	257	
Other injuries	80	

The above statistics surely tend to show how necessary the coöperation of the people as a whole is to the work of the commissions and accident boards of the various States, in the matter of accident prevention. It has been proved that in nearly 50 per cent of the cases the accident is preventable.

Fatherless Frogs

A few years ago much interest was aroused by the brilliant experiments of Prof. Jacques Loeb on artificial parthenogenesis. Parthenogenesis, or the development of the unfertilized egg into the adult form, had long been known to exist in the lower groups of animals. Where this occurs, the parthenogenetic generation alternates with a sexual generation, the offspring of the parthenogenetic generation usually being males and females, and the offspring of the sexual generation being females. The parthenogenetic development occurs during the warmer months of the year when food is abundant and the temperature high. Sexual generation occurs during the colder parts of the year. Parthenogenesis is a very definite and regular thing in those groups where it occurs, namely, rotifers or "wheel animalcules," some of the crustaceans, bees, ants, plant lice, etc.

Professor Loeb sought to induce parthenogenetic development artificially in those forms where it was known not to be a regular cycle in the development. In this he was successful, causing the unfertilized egg of sea-urchins and star fish to develop to the pluteus stage (where the larva swims about), by immersing the eggs first in a chemical solution for a few minutes, and then placing them in normal sea-water. His work was the stimulus to a great deal of experimentation in this direction. Various methods of producing artificial parthenogenesis have resulted and many of the eggs of the invertebrates have proved to respond to experimentation. Distilled water, certain chemicals, mechanical shock (shaking), changes of temperature, and lack of oxygen are some of the common methods employed to cause the unfertilized eggs to develop.

But all these results concern very lowly organized invertebrate animals. Exciting as they are, they after all fall short, in human interest, of a case in which the egg of an animal belonging to the vertebrates—as does man himself, develops without fertilization. Such a case has recently been described by Professor Loeb. Parthenogenetic development does not normally occur among the vertebrates, but Professor Loeb and his assistant, Dr. Bancroft, have succeeded in obtaining artificial parthenogenesis of the egg of the frog by mechanical means. About 10,000 unfertilized eggs of the wood frog and 700 of the leopard frog were punctured with a platinum needle. By no means all of the eggs punctured passed thru the early stages of cell division. Only two of the wood frog reached the tadpole stage, but died before they were able to swim. Of the leopard frog, the number which reached the tadpole stage was greater and two became well developed tadpoles. Of these two, one passed almost completely thru the stage of metamorphosis to that of a well developed frog, only a remnant of the tail being left. It died at the end of five months. The other tadpole died at the end of six months in the early stage of metamorphosis, i. e., the hind legs had just commenced to grow.

DEVELOPED BY ARTIFICIAL PARTHENOGENESIS

These tadpoles grew from unfertilized eggs which were pricked with a platinum needle. Tadpole No. 1 lived five months and passed almost completely beyond the tadpole stage. No. 2 died after six months with rudimentary hind legs only.

This remarkable result of causing the development of an unfertilized egg into the adult form means that we must change somewhat our idea of the part that the male plays in the perpetuation of the race. These experiments on parthenogenesis prove that a union of male and female germ cells is not essential to induce the egg to develop. What then is the function of the male germ cell or spermatozoan? It has normally a two-fold function; on the one hand to stimulate the egg to begin development, and on the other hand to put into the offspring the hereditary characters of the father. These two functions are biologically of perhaps nearly equal importance, but the work of Professor Loeb and his followers has shown that one of these functions is not a unique attribute of the sperm, while the other is, so far as we now know. A platinum needle may be the father of a frog, in the sense that the needle caused this particular frog to exist, but it is equally clear that this frog can not inherit any of the characteristics of its metallic parent.

MAUD DEWITT PEARL.
Maine Agricultural Experiment Station.

Negro Church Statistics

From Bishop C. S. Smith, of the African Methodist Episcopal Church, we received statistics of the colored churches in the

United States. They include all but a few small independent denominations whose members are negligible, and a few others, like the Episcopal, Presbyterian or Congregational churches, which do not separate their churches by color, and for these figures are not available.

Denominations	Preachers	Congregations	Members
Regular Baptists	12,622	16,725	1,912,219
Primitive Baptists	1,980	797	35,076
African M. E.	6,674	5,630	630,273
African M. E. Zion	3,448	3,298	547,216
Colored M. E.	2,901	2,857	234,721
Union Amer. M. E.	138	255	18,500
African Union M. E.	200	125	4,000
M. E. (colored branch)	2,293	3,474	282,724
Cumberland Pres.	375	198	18,066
Grand total	30,961	33,417	3,682,756

The African M. E. Church has one preacher to each 93 members; African M. E. Zion Church one preacher to each 157 members; Colored M. E. Church, one preacher to each 80 members; Methodist Episcopal Church (colored branch), one preacher to each 122 members; Baptists (regular), one preacher to each 151 members.

The African M. E. Church has 12 active bishops in the home field, one to each 500 preachers and 50,000 members; African M. E. Zion Church, 8 bishops, one to each 491 preachers and 68,400 members; Colored M. E. Church, 6 bishops, one to each 483 preachers and 39,120 members.

Presuming that 1039 will cover the number of colored Presbyterian, Episcopalian and Congregational preachers, it will make the grand total of colored preachers 32,000, one to each 312 of the entire colored population of this country. The grand total of colored church members in this country may, approximately, be given as 3,700,000. The estimated amount of church property owned by them is $56,000,000.

It may be assumed that the entire 10,000,000 of colored people in the United States are believers in the Christian religion. The actual number of evangelical Christians among them is greater in the aggregate than that to be found among all the other darker races in the world. This is a splendid tribute to the heroic faith of a humble people—ofttimes tried in a fiery furnace heated seven times.

An Alligator Stairway

Dogs and cats, and other domestic pets, don't think much of their ability to go up and down stairs. But stair-climbing with alligators is not an easy performance, and is no doubt as laborious for them as it is for the tired housewife. But the alligator has the advantage of going up on all fours, and for that reason he is surer of his footing. There is an incentive in stair-climbing for the 'gator. He knows when he gets to

EXCELSIOR!

the top he will have a nice slide down into a refreshing pool of water.

Straight or Curly Hair

The hair of most mammals is straight. We conclude from its wide distribution that straight hair is the older type and that curly hair is a specialized type. If we examine a straight and a curly hair under the microscope we find that they have marked structural differences. Straight hair is nearly circular in cross section while curly hair is flattened into an ellipse. The proportion of the long to the short axis of the ellipse increases, with the degree of curling, until in woolly hair it is as great as 100 to 40. Also the form of the hair follicle differs in straight and curly hair. In curly hair the follicle is both flattened and curved so that the hair has to emerge from "an incurved mold."

It is a law of heredity that the presence of a characteristic dominates over its absence. Hence we are not surprised to find that straight hair is recessive to curly and since parents cannot transmit what they have never themselves gained, straight haired parents, without curly haired ancestry, have straight haired children only. A few cases are known where dominance is so imperfectly exprest in the parent that the hair is only slightly wavy, yet such persons have had curly haired children. In such instances the true nature of the parent is revealed by his transmission. The hereditary behavior of wavy hair shows us that it is not, in reality, an intermediate stage between straight and curly; but that it is of mixt origin, for it is capable of transmit-

ting both ancestral types of curly and straight hair.

If one of the parents has inherited curly hair in all lines he is called, in the language of heredity, a pure dominant, and such a dominant has curly haired children under any and all conditions. Altho his hair may be curly, if he is of mixt origin, then only one half of his children will have curly hair provided he marries a straight haired wife. If her hair also is curly the proportion of curly haired children increases. Thus curly haired parents may have curly, wavy or straight haired children, but parents whose hair is strictly straight can have straight haired children only.

ENGLISH HOWLERS.

The following quotations from British examination papers and themes, ridiculous as they are, might be matched from many an American teacher's experience:

The Seven Great Powers of Europe are gravity, electricity, steam, gas, fly-wheels, and motors, and Mr. Lloyd George.

Queen Elizabeth was tall and thin, but she was a stout Protestant.

During the Interdict in John's reign, births, marriages and deaths were not allowed to take place.

Henry VIII gained the title Fidei Defensor because he was so faithful to his Queen.

A Kelt is part of a Scotchman's dress.

Cave canem.—Beware lest I sing.

A vacuum is an empty space with nothing in it; the Pope lives in one.

A vacuum is an empty space full of nothing but Germans (germs?).

A Conservative is a sort of greenhouse where you look at the moon.

Parliament assembled in September and dissembled in January.

The Habeas Corpus act was that no one need stay in prison longer that he liked.

Wolfe gained fame by storming the heights of Abraham Lincoln.

Where was Magna Charta signed? At the bottom.

Where was Mary, Queen of Scots born, and why was she born there? Mary was born at Linlithgow because her mother happened to be there at the time.

Wellington threw up earthquakes behind him as he retreated.

The religion of the people of the Ganges Delta makes them clean, but, like other things, there are some who do not keep the rules. They live an open and free life except for the few wigwams which are inhabited by natives. These have a funny custom of throwing their babies into the Ganges as a sacrifice to Buddha.

The Hindus generally are a hardy race, but prefer to worship in their temples rather than follow much manual labor; what little they do is mostly carrying luggage and such like; the rest of their time is spent in wandering about in the shade of the various palms.

The plains of Siberia are roamed over by the lynx and the larynx.

What is the object of distillation? Describe the process and the apparatus used. Answer: The object of distillation is the making of whisky. You have a box and a glass tube at one end and another at the other end, and if you pour water in at the one end it comes out whisky at the other.

"Tim," inquired Mr. Riley, glancing up over the door of the post office, "what is the meanin' of thim letters, 'MDCCCXCVIII'?" "They mean 1898." "Tim, don't it sthrike you thot they're carryin' this spellin' reform entoirely too far?"—*Youth's Companion.*

MOURNING

THE WEEK

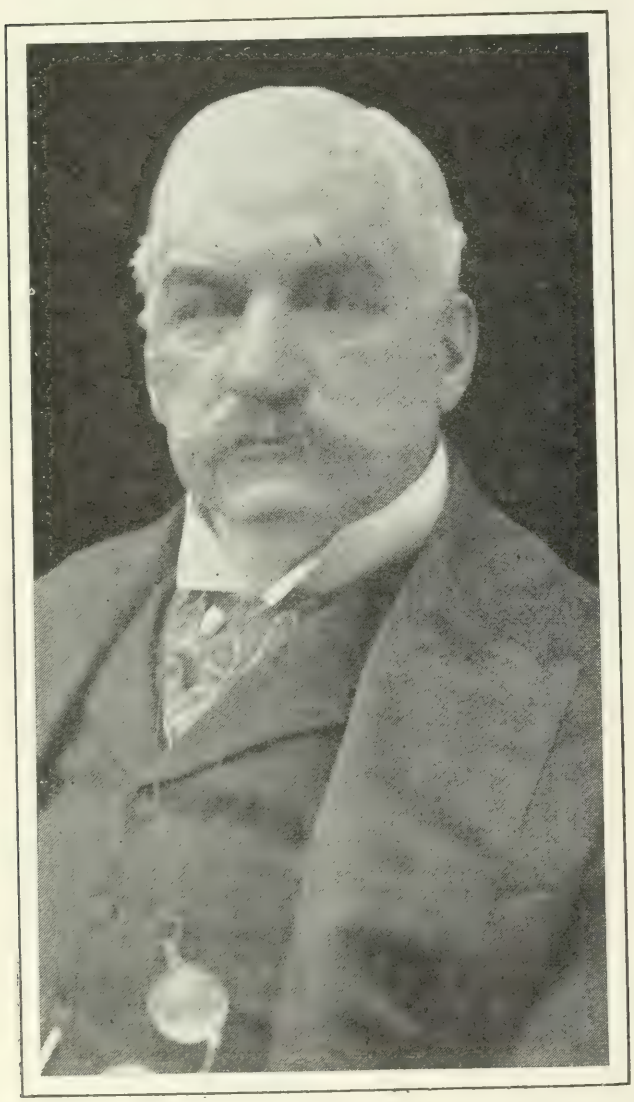
Tornadoes and Great Floods

The great and disastrous floods in the Middle West were preceded by tornadoes in other parts of the country. These began on the 21st ult., passing from Texas northward. About 130 persons were killed in the South, 95 of these in Alabama, where the town of Lower Peachtree was destroyed. In Selma, 30 lives were lost; in Thomasville, 19, and Hoxie, Ark., was wiped out. Moving northward the hurricanes swept thru parts of Kansas, Missouri, Indiana, Iowa and Nebraska. The greatest loss was in Omaha, where, on the night of the 23d, about 200 persons were killed and $5,000,000 worth of property was destroyed. The tornado's path thru Omaha was from four to six blocks wide and several miles long. Fire broke out in the ruins but was extinguished by heavy rain. Eleven churches and eight public schools were wrecked, and with these nearly 700 dwelling houses. The latest accounts give the following list of the numbers killed: Omaha, 202; Yutan, 16; Berlin, 7; Council Bluffs, 12; Terre Haute, Ind., 18; five towns in northern Iowa, 12. The tornadoes were followed by a blizzard and very low temperature. Help was sent to Omaha from several places. A train from Des Moines carried forty physicians, with nurses and supplies.

Next came the great floods in Ohio and Indiana. Every stream suddenly rose. Dams melted away and the waters of great reservoirs were set free. In Dayton, a city of 125,000 people, the water was from 8 to 20 feet deep in the main section. Three rivers and a creek come together in or near the city. A reservoir which fed a canal was emptied. Levees in the city were swept away. Thousands of residents were marooned on roofs; 70,000 were homeless. The National Cash Register Company's plant, on a hill, was a haven of refuge. There a great many were sheltered and fed. The first night three children were born in that place. John H. Patterson, the company's president, recently convicted and sentenced to jail for violation of the Sherman act, was commander of the relief corps. Dayton's grateful people have asked President Wilson to pardon him.

Martial law was proclaimed at Dayton, and the place was patrolled by regular troops and militia. Vandals were at work. Sixteen of them were shot. Secretary Garrison visited the city and sent a report to President Wilson. It was thought at first that 2000 had been drowned there, but the number has fallen to about 200. There are 40,000 persons to be fed, 10,000 houses to be cleaned, and 2000 wrecked buildings to be razed. The treasury is nearly empty. The west part of Columbus was under water, and 10,000 are homeless there, where 130 lives were lost. The latest reports say 90 in Hamilton, 185 in Chillicothe, and 185 in Middletown. At first it was believed that 2000 had died in Peru, but the number has been cut down to 20.

Not far from Peru were the winter quarters of a circus and the accompanying menagerie. The animals were set free. Nine of the twelve elephants perished, lions and tigers were swept away, and 300 circus horses were drowned. Near Lima were ten miles of railway cars which could not be moved. In Indianapolis many lives were lost. Youngstown's factories were out of commission. In Delaware the main street had 7 feet of water, and five bridges were carried away. Zanesville and Tiffin suffered much loss. One-third of Marietta was destroyed. The industries of Wheeling, W. Va., were severely affected; 100,000 workmen at Pittsburgh were idle.



In New York State the Hudson, at Albany, was higher than any previous record. The Genesee, at Rochester, surpassed the high record of 1865. Albany's filtration plant was flooded, and both that city and Troy feared an epidemic of typhoid. President Wilson in a proclamation appealed to the nation, asking for liberal contributions to the Red Cross Fund. Subscriptions in New York City rose to nearly $500,000.

At the beginning of the present week the waters were receding from the stricken cities, but the larger rivers were rising and there was danger along the banks of the Ohio and Mississippi. A large tract of Cincinnati's water front was submerged. Cairo was menaced, and a majority of the residents fled. One or two of the levees on the Mississippi gave way, and Memphis prepared for very high water. Much loss along the Mississippi was expected. In the middle of the week the published estimates of loss of life and property in Ohio and Indiana were far above the true figures, but it was

impossible then to get the facts. In another place we refer to the property losses and to the effect of the floods upon business. By the latest calculations, the railroad losses do not exceed $50,000,000.

Morgan

J. Pierpont Morgan died in Rome, March 31, at noon. The financier had been kept in bed during the past week, but his condition apparently did not alarm his physicians until Wednesday, the 26th. He had no organic ailment; he was merely "used up." He suffered no pain; but wasted away because his nervous system was inactive, and his body was incapable of nourishing itself. Only last December, Mr. Morgan testified before the Pujo Committee of the House of Representatives as to the existence of a "money trust," and not long after he crossed the ocean. Reports cabled from Egypt stated that the New Yorker had lost his old time vigor, and since his landing in Naples he has steadily sunk.

Copyright, Pach Bros.
THE LATE J. P. MORGAN

John Pierpont Morgan was born at Hartford, Conn., April 17, 1837. He was graduated from the English High School, Boston, and studied at the University of Göttingen, Germany. He received honorary degrees from Oxford, Harvard, Yale, and other institutions. Married in 1861, he lost his wife the next year, and in 1865 married Frances Louise Tracy, who bore him one son, J. Pierpont Morgan, Jr., a member of his late father's banking house, and three daughters.

Mr. Morgan's banking experience was begun in 1857, when he entered a private New York bank. The banking house of Drexel, Morgan & Co., which became in time J. P. Morgan & Co., dates from 1871. It was this financier who floated the bond issues of $62,000,000 during the Cleveland administration, and he it was who secured an American subscription of $50,000,000 to the British war loan of April, 1901. He has also organized and floated securities of the United States Steel Corporation. His constructive genius manifested itself not only in finance but also in the fields of art and churchmanship.

No disastrous consequences are expected to follow the financier's death, which had been discounted in Wall Street. Samuel Untermyer, who as counsel for the Pujo Committee conducted the examination of Mr. Morgan from which his physical decline is dated by his physicians, said on Monday:

"With the death of Mr. Morgan the world loses one of its most conspicuous figures and our country sustains the irretrievable loss of a generous, patriotic citizen of rare breadth and public usefulness. The art world, and especially our Metropolitan Museum, will never be able to replace him.

"Whatever may be one's views of the perils to our financial and economic system of the concentration of the control of credit, the fact remains and is generally recognized that Mr. Morgan was animated by high purpose and that he never knowingly abused his almost incredible power."

At the Court of St. James

Walter H. Page, editor of *The World's Work*, is to be Ambassador to the Court of St. James.

President Wilson, who offered the post to Richard E. Olney and President-Emeritus C. W. Eliot, of Harvard University, has succeeded in his evident purpose of sending to London a man of distinguished position in American public life and letters. Dr. Page is a native of North Carolina and a Southerner by education; a graduate of Randolph-Macon and Johns Hopkins.

Our next Ambassador did his more important journalistic work on the Boston *Post*, the Springfield *Republican*, and the New York *World*. He made a special study of the condition of the negro as correspondent of each of these papers. After further work with the New York *Evening Post* and the *Forum*, Dr. Page went to Boston, in 1896, to take charge of the *Atlantic Monthly*.

His most distinctive contribution to American journalism—*The World's Work*—took shape in 1900. He has since been editor of this, our unique contemporary, as well as a member of the publishing firm of Doubleday, Page & Co.

As a new variation in the line of bookmen who have represented us at the Court of St. James's, following the poet Lowell and the journalist Whitelaw Reid, the appointment of Dr. Page is in line with the best American traditions.

Official Murder in Mexico

When Huerta became Provisional President of Mexico he made his nephew, Enrique Zepeda, Governor of the Federal District, in which the capital is situated. This man, at 3 o'clock in the morning on the 27th, after drinking and carousing in a café, went to the penitentiary and demanded three Maderist Governors of States, who were confined there, saying he had a right to kill them. The Governors were protected, and when he asked for Major Gabriel Hernandez, a Maderist commander of rurales, he was told that Hernandez was in the Belem prison. Going to that place, he and his companions dragged Hernandez from a cell, shot him and, having poured oil on the dead body, attempted to burn it. When the Minister of the Interior and others who had heard of Zepeda's acts arrived at the prison, half of Hernandez's body had been consumed. Some time later Zepeda was found in a drunken stupor and arrested. He is a rich man, having made a fortune by means of army contracts, and he had been associated with Huerta in business. His defense will be temporary insanity.

Governor Rivera, of Sinaloa, was arrested by Huerta's orders and placed on a transport at Mazatlan. He was to be taken to the capital for trial, it was said, but soon after the ship sailed word was sent back that Rivera had fallen overboard and been drowned. He had opposed Huerta's rule, and had been supported in this by the State Legislature. Gen. Geronimo Trevino, who resigned as Governor of Nuevo Leon, was carried to the capital as a prisoner. There he had a talk with Huerta, and at last accounts he was still living. In Jiminez, near Parral, ex-Senator Roseties, a capitalist named Baca, and several other Maderists were put to death last week. Gerald Brandon, correspondent of American newspapers, was arrested at Cuernavaca while trying to interview Zapata. Owing to a plea from Washington he was released and ordered to leave the country. When he reached Vera Cruz, however, he was again put in prison.

In the north, the rebels continue to be successful, as a rule. They captured the American mining camp of Cananea, 30 miles from the Arizona boundary, after two days' fighting. There they took 350 prisoners, and in the battle 300 were killed. A Federal garrison in Durango joined the rebels. Another, 170 men, holding a town in Tobasco, revolted, looted a bank and embarked on a small steamship. This soon foundered and 105 were drowned. General Orozco's father, with two or three associates, sought Zapata to negotiate peace with him. The bandit leader placed them in prison and they have not been released. Two women called upon Felix Diaz at his country place and made an unsuccessful attempt to assassinate him. There are rumors that Huerta and Diaz have quarreled.

Huerta has formally complained to our Government on account of the shipment of arms and ammunition across the boundary to rebels. He asks that greater vigilance be shown by our military patrol. A committee of prominent American residents of the capital has been sent to Washington to ask for the reappointment of Ambassador Henry Lane Wilson.

Other Countries South of Us

Cuba's Congress adjourned last week, but another session will begin on the 7th. The amnesty bill, which our Government emphatically disapproved, was not passed. As to the terms of it the House and the Senate disagreed. It will be taken up at the coming session. There was no movement for bringing to account the member of the House who had libeled the United States Minister, Mr. Beaupre, in his newspaper.

Dispatches from Hayti persist in saying that a revolution is near at hand. The Government continues to arrest suspected persons, and the prisons are full. It is asserted that several of those recently arrested have been put to death. An attempt to overthrow the Government of Santo Domingo is said to have been made a short time ago by the Minister of the Interior (a brother of the President) and two generals, who were plotting in the interest of the present Minister of War. It came to nothing.

When our loan agreement with Nicaragua was made, American financiers undertook

to reform the republic's currency, and our Senate's failure to ratify the agreement did not prevent them from completing their work. The new monetary unit, called a cordoba, equivalent to our gold dollar, is now in circulation, displacing the paper peso, which has a value of only 8 cents in gold. Nicaragua is now on a gold basis. Her paper dollars have at times been worth only 4 or 5 cents. Salvador needs money, and offers of $10,000,000 from European bankers have been received. New York bankers do not seem inclined to compete.

In Brazil, President Fonseca is criticising the press, which should be restrained, he says, from attacking the Government. On the other hand, prominent army officers have held a meeting to protest against interference with the press's freedom. Colombia's Consul General at New York, taking up the Panama dispute, asserts that Mr. Knox, in his recent report, which was sent to Congress, misrepresented Colombia's attitude and made statements which were not true.

Because all the gates in the west chambers of the great locks of the Panama Canal will be finished by October 1, some predict that ships will pass soon after that date, since Colonel Goethals has said that it would not be necessary to wait for the east chambers. At the coming special session of Congress, Senator Chamberlain, of Oregon, will introduce a resolution requiring our Government to give notice of a termination or abrogation of the Hay-Pauncefote treaty. He argues that it was negotiated upon the assumption that we were to make the canal on foreign territory; that we are making it on our own territory, and that for this reason the treaty may well be laid aside. An impression prevails at Washington that President Wilson opposes the exemption of our coastwise shipping from the payment of tolls and would be glad to see the exemption repealed.

Peace Talk and Chauvinism in England

Winston Churchill's proposal that the year 1914 be made an international holiday so far as warship construction goes, is the subject of editorial discussion in this week's INDEPENDENT.

A strong committee has been named for the Anglo-American Exhibition to be held at Shepherd's Bush, London, in 1914 in commemoration of a century's peace between the English speaking peoples. Among the British citizens who have given the use of their names are the Duke of Roxburghe, the Marquis of Hertford, Lord Craven, Lord de la Warr, Lord Granard, Viscount Powerscourt, Mr. Waldorf Astor, and the Lord Mayor of London. The Americans named include Messrs. Isaac Seligman, Andrew Carnegie and J. Ridgely Carter, of the American Embassy. The late Whitelaw Reid suggested the exhibition some years ago.

The Unionist party has won a Pyrrhic victory in the reëlection of Colonel Weston as Member of Parliament for Kendal, by an increased majority. Colonel Weston is an avowed free trader, and was not supported by the national party machine. Unionist newspapers went so far as to announce that his election would be a "slap in the face" of the party—tho now they claim a victory in the bye-election. Colonel Weston's election is likely to prove the signal for "a stampede of the Unionist rank-and-file from 'tariff reform,'" according to local critics of the situation.

If so, a new Unionist "issue" must be found, and perhaps Lord Roberts's agitation for conscription will be chosen for the purpose. Colonel Weston made compulsory military training, but not conscription, a plank in his platform. But this prospect does not alarm Liberals. They are much more perturbed over the suffragets and the difficulty of treating their disturbances. So far they have followed no consistent policy, and have been equally condemned in various quarters for brutality in compulsory feeding and weakness in releasing mutinous prisoners.

France's New Ministry

Of M. Barthou's newly formed ministry it is generally predicted that it will be short-lived. But ministers deemed at first to be deficient in lasting powers have sometimes belied their prophets, as did one of Waldeck-Rousseau's, which endured three years after obtaining a majority of but twenty on its initial vote. Seven weeks have now elapsed since the proposal of restoring three years military service, and there is no notable change in the temper of the people.

Germany's Huge Military Budget

Tho the anniversary of Prussia's emancipation from the foreign conqueror, Napoleon, was the occasion for the first announcement of increased expenditures on the military establishment, it was hardly to be expected that the announcement of new and supplementary taxes would be greeted in Germany with much enthusiasm. Germany plans an annual expenditure of $262,500,000 on its armaments. The official announcement of the extent of the increase, amounting to almost $50,000,000, has been received with deprest resignation; the

Socialist press alone openly condemns the "orgy of militarism." Fear is exprest that movable capital will be driven out of the country by the new war tax. Property under $2500 in value is exempted from this.

Foreigners earning a livelihood in Germany are included among those subject to the new taxation. There is agitation, owing to this, and the fact that Jews are among the persons making the heaviest sacrifices for the Fatherland, for the removal of obstacles in the path of Jews who would become army officers.

Germany's war-chest, kept in the Julius Tower at Spandau, eight miles from Berlin, has in the past contained $30,000,000. The value of the gold stored there has very materially depreciated since the Franco-Prussian War, when the chest was established out of the billion dollar French indemnity. And now $60,000,000 will be added to this emergency fund, that still consists of French 20 franc pieces. Half the additional amount will be gold, half silver. To secure the currency, gold will be gradually withdrawn from circulation, and paper will be substituted for small silver.

If the new army bill passes, as it seems sure to do, Germany's land forces will comprise, on a peace footing, 33,800 officers, 119,000 non-commissioned officers, 661,176 privates, and 15,000 one year volunteers. Medical, veterinary and pay officers, artificers, the hospital corps, etc., will bring the total up to 870,000. In two years the increase in personnel amounts to 136,000 men and 27,000 horses. Almost $20,000,000 is asked for military aviation, while $12,500,000 more is wanted for naval air craft.

Privy Councillor Schwartz, chief financial adviser of the Imperial Ministry, states that the proportion of military expenditure to population is lower in Germany than in France and England. According to his statistics, the German expenditure for armaments is $5.90 per capita, 1912-1913, while in France it is $7.50. The official reason for the increase in the military establishment is the alteration of the balance of power in Europe as a result of the Balkan War.

The Fall of Adrianople

On March 26 Adrianople fell into the hands of the Bulgars and Servians. The city, defended by the Turks, under Shukri Pasha, was surrendered after a vigorous attack of two and a half days. When the outlying fortifications were taken, the defenders set fire to their stores, as well as to the barracks, arsenal, powder magazines, and artillery park. Most of the population fled at, or before, the explosions. General Savoff was in command of the Bulgars. Ferdinand of Bulgaria entered the city on the 28th, and reviewed his victorious troops.

The siege has lasted five months and more. During this time bombardments have been frequent. Turkish cannon and about 30,000 prisoners were taken by the Bulgars. The fortifications of the city consisted of forty modern forts, composing a semi-circle round the northern half of the city from east to west, with less important fortifications between. South of the city were more fortifications, and marshes.

Adrianople has declined since the Russo-Turkish War of thirty-five years ago, but boasts some forty mosques. Several of these are uncommonly fine architectural examples. The grand mosque of Selim II was blown up before the surrender. This ancient city was rebuilt in the second century of the Christian era by the Roman Emperor Hadrian. Great victories by the Goths in 378 and by the Huns in 586 have imprest its name upon history. The Russians have taken the city in two instances, in 1829 and in 1878.

In the present siege 75,000 to 100,000 Bulgars and about 30,000 Servians were engaged. Jealousy between the allies has been manifested, even in official circulars, and the Servian troops were ordered away soon after the city's fall. The Bulgarian loss in the last day's fighting was very heavy—perhaps 14,000 killed and wounded. Thruout the siege the allies bombarded the city mercilessly, and the Turks defended it with an energy the more remarkable when one considers that Adrianople has been attacked by hunger and disease as well as by gun fire. Unless peace is declared in the meantime the troops who captured Adrianople will, with their siege guns, be moved to Tchataldja, where the Turks are at bay.

Other News from Turkey

Fighting between Bulgars and Turks at the Tchataldja lines has resulted in more reverses for the latter, whose retreat ended in a rout. If the Bulgars press on to Constantinople they should take the capital without insurmountable difficulty. Constantinople fears more than anything else the possibility of mutinous Ottoman troops entering the city, running amuck, looting, and murdering foreigners.

The Turkish troops have suffered great hardships thru the inefficiency of their commissariat. The Sultan has wept over his military humiliations, and it is reported that his embassies have been instructed to appeal to the Powers to hasten mediation.

Montenegro Against Europe

The Powers sent a joint note to Montenegro on March 28, making representations apropos of respecting the Albanian frontier and raising the siege of Scutari. The bombardment of the town was, however, resumed on March 29. It is apparently the intention of the plucky mountaineers to risk intervention.

The Montenegrin Foreign Minister, in a despatch to a London newspaper, characterizes the action of the Powers as "an act of crying injustice." Montenegro, he continues, "is the sole ally in whose path an attempt is made to raise a barrier. To create Albania, they would kill Montenegro. Such a decision we will never accept. This much we owe to our history as the advance guard of Christianity in the face of the Ottoman conqueror. Montenegro appeals to the sense of justice and right of the British nation and the world. She will continue her operations until she has signed peace with Turkey."

Earlier in the week Montenegro notified Essad Pasha, in command of Scutari, that the civil population could leave the besieged city. And from Vienna came reports that pressure would be brought to secure the evacuation of the territory fixt by the Ambassadors as the newly constituted State of Albania—a State which is made up of Christian inhabitants of both the Roman Catholic and Greek Churches, and of Mohammedans; a State without a national language or tradition; a State literally carved out of the map to satisfy political exigencies. Bulgaria and Servia have ruefully accepted the requirements of the European concert.

THE NEW KING OF THE HELLENES

King Constantine is standing in the center of the group, in the rear. He is holding his nine-year-old daughter, Princess Irene. Beside him stands his son and heir, who may reign as George II, and is in his twenty-third year. From left to right in the center row sit Queen Sophia, Princess Helene (aged seventeen), Prince Alexander (aged twenty). In the foreground sits Prince Paul, who was born in 1901.

Greece

The body of George I, the assassinated King of the Hellenes, was removed from Salonika to Athens and lay in state there until the funeral on April 2.

An illustration on this page shows King George's son, King Constantine, and the members of the royal family.

The Chinese Constitution

On April 7 the new Chinese Congress will meet to choose the first regularly appointed President of the Chinese Republic and create its constitution. The elections show that the choice is likely to fall on Yuan Shih-kai, altho the party pledged to him does not quite control a majority of the delegates. According to our last reports by mail the Nationalist party has in the House of Representatives 284 members, a large plurality but not a majority over the Republican, Unionist and Democratic parties. The Nationalists support President Yuan. The chief constitutional questions to be settled have to do with the limits of the authority of the President and of the Provinces. After the organization of the new Chinese Congress it is expected that President Wilson will formally recognize the republic. The delay has been caused by the declination by John R. Mott of the post of Ambassador to Peking. The appointment of Prof. F. J. Goodnow, of Columbia University, as constitutional adviser, will put upon him a duty of unparalleled usefulness.

A Standard Oil Loan for China?

According to a letter received in London from a Chinese correspondent of the *Times*, the Standard Oil Company has made an offer to the Chinese republic for the sole rights of exploiting petroleum in China for a term of years in consideration of an immediate loan of $35,000,000 gold.

ADVERTISING AFFIRMATIONS
BY GEORGE FRENCH

X—Honest Advertising

There is beginning a great campaign for honest advertising. The big association of advertising clubs has a "vigilance committee" that is working in a systematic way to get advertisers to employ the truth in their announcements, and a definite measure of success has already been secured. This committee is engaged in prosecuting fraudulent advertisers who will not yield to gentler measures, and in advising advertisers who are unwisely using bad methods in the promotion of the sale of good goods. Several deceptive advertisers have been put out of business, and several others have mended their ways. Many advertisers have changed their methods and improved their copy.

There are now about forty other vigilance committees of local advertising clubs, all doing something to induce advertisers to use better methods and more truth in their advertising. These formal committees are but evidences of a general improvement in advertising methods, and represent but a small proportion of the sentiment working along the same lines. Many of the great advertising agencies are insisting that their clients shall deal frankly with the public, thru their advertising. Most of the big advertising mediums demand that advertisers using their pages shall have goods equal to their claims in advertisements and shall deal justly with their customers. It is geting to be very difficult for a doubtful financial scheme to get the publicity necessary to attract money. It is getting to be difficult for a shady real estate project to obtain profitable publicity.

In the financial field some of the best mediums are so critical as to bar enterprises that are apparently perfectly legitimate, because in the judgment of the financial editors they are not based upon reasonable probabilities, or because their methods might prove inadequate for the protection of their stockholders or investors in times of panic or serious financial disturbances. It is not unusual for an apparently sound manufacturing enterprise to fail to get its advertising into the best medium for the reason that its policy or methods of manufacture did not meet the approval of the experts connected with the mediums.

Advertisers of legitimate goods who conduct their advertising campaigns with the rights and benefit of their potential customers always in mind are objecting to the publication of "shady" advertisements in the mediums they use. Readers of magazines and newspapers are beginning to object to the appearance of misleading advertisements in periodicals they take in. Probably there is no more frequent complaint to editors than against advertisements supposed to be misleading or fraudulent.

Publishers have been among the first to appreciate the justice and strength of the new demand for honesty in advertising, with the result that most reputable publications endeavor to exclude advertising calculated to deceive, whether or not the motive of the advertisers is or is not honest. An advertisement may be entirely truthful, and the goods offered exactly as represented, yet the advertisement may be intended to deceive. An advertiser may, for example, take a page for one time in a popular medium merely for the purpose of impressing the trade; or he may take a small space in several big mediums, and then go about boasting of his exclusive advertising, intending to deceive the trade that handles his goods. Careful publishers are sacrificing much business to protect the public.

But the most potent cause operating to drive the objectionable advertising off of the pages of magazines and newspapers is the dawning consciousness in the minds of shrewd advertisers that it does not pay to attempt to fool the people. It is almost impossible to make a misleading advertisement appear like an honest advertisement. Readers are getting extremely sophisticated. The old allurement of the improbable claims has in a measure worn away. The readers of the newspapers and magazines are really getting wise, altho it is evident that not all of them have as yet got wise enough to protect their purses. Still, there is in the public mind a growing ability to discriminate between the good and the bad in advertising, and the advertisers have been quick to recognize and respond to it.

The millennium is not yet in sight, in this matter of honest advertising, but we are sensible of the fact that there has been a long step taken in the direction of that millennium. The advertising of today is none too good. If it is examined for misstatements of all degrees there will be plenty of them discovered. But all the same advertising is so much better than it was that we can all sing a loud hosanna

IN THE INSURANCE WORLD

BY W. E. UNDERWOOD

Plea for an Open Field

There recently came to our desk a press copy of an address on the subject of workmen's compensation legislation delivered by Mr. J. Scofield Rowe, vice-president of the Aetna Life Insurance Company, which was laid aside at the time for attention during a more leisurely period. The principle of workmen's compensation is now generally accepted by all classes of citizens, but there exist serious differences of opinion respecting the form in which it should be administered. The labor interests are firmly committed to the proposition that it should be conducted as a monopoly by the State, and in this they have the support of many legislators.

Mr. Rowe undertakes to show that it is for the best interests of employers, employees and society at large that the several methods of administering it should be in competition in the open field, and it must be admitted that he makes a strong case. He reaffirms the doctrine that "competition promotes economy; monopoly encourages extravagance and inefficiency." He enumerates four ways in which the business of workmen's compensation insurance may be handled:

1. The individual employer carrying his own risk, provided he can satisfy the proper authorities that all payments that may become due on account of injuries to his workmen will surely be made.
2. Insurance thru mutual associations of employers.
3. Insurance thru a fund made up of contributions from employers and administered by a State department.
4. Insurance thru stock insurance companies.

Recognizing the right of the State to decree that employers of labor shall become financially responsible to their employees for injuries or death incurred in the course of their employment, Mr. Rowe also insists that employers may exercise the privilege of caring in their own way for such obligations, provided they can satisfy the State of their ability to do so.

Employers of comparatively slender resources should be permitted, he asserts, to join their fortunes and establish mutual associations if they desire. In fact, he adds, "the mutual idea is the basis of all insurance, and the stock company is a logical development of it, owing its existence primarily to the fact that people who should naturally associate themselves together for mutual protection cannot usually be brought together in sufficient numbers except in a stock company." So he would leave the field open to the mutuals, admitting at the same time that they would probably prove to be keen competitors of the stock companies.

He then takes up the State-administered fund which, if it has a place, should hold it on the same terms and conditions granted the three other instrumentalities mentioned. His arguments against endowing it with monopolistic powers are, to the practical business mind, unanswerable; as is also his claim that it would become more efficient under the spur of competition.

Mr. Rowe reserves what he has to say in favor of the stock companies' participation in the business as competitors of the other three to the last, expressing entire confidence in their experience and financial strength to give a good account of themselves, both as to the cost and the efficiency of the service.

For obvious reasons it is impossible in this place to do more than briefly summarize this long and interesting address—this frank request for an open field. But there is one point made which should not be overlooked in this or in any other discussion touching the erection of a system of workmen's compensation insurance, and that is the maintenance of ample premium and loss claim reserves by all classes of insurers, be they individual employers, mutual associations of employers, State-administered funds, or stock companies. Without such reserves every scheme that may be invented is a failure. Security, future ability to meet all demands, is the first requisite.

Mr. Rowe's address is admirably conceived: it is courteous in form and tone, considerate of existing conflicting opinions, generous in concessions where they are made, candid in statements and admissions and forceful in arguments. It is the plain request of a man representing a good cause for fair play. He says on his final page:

> We are just as heartily desirous of seeing this problem solved in the best possible manner as we are of keeping our business, and we believe that the stock insurance company is qualified, and destined, to play an important part in the solution. If it is not so qualified, and does not demonstrate unmistakably that it is so qualified, it will not play that important part. . . . If a State-administered fund is the most

desirable way of carrying the responsibility, it will get the bulk of the business. If mutual insurance is the logical solution of the problem, it will eventually become predominant. If the stock company can do best by both employer and employed, the business will come to it. Who knows, or can foretell? And who ever will know unless all these methods are allowed to compete fairly in an open field, with special favor to none?

Getting the Right Start

Many letters come to this department from readers asking for guidance thru real or fancied insurance troubles. We put it that way because not all the difficulties described have substantial foundations in fact. At the same time, in the interests of truth, we are constrained to admit that too many of them represent real grievances. To illustrate: in the matter of life insurance a great number of people seem to be carrying policies unsuited to their age and condition in life. They started wrong.

It would be more accurate to say they were started wrong, for in the vast majority of cases applicants act upon the advice of company representatives thru whom insurance is procured. The companies are generally blameless in this matter, for to a person who can successfully meet all the physical requirements, they are ready to issue, under their underwriting regulations, any form of policy desired, at its proper premium. The varying terms of the different policy contracts equalize all the differences which exist between a low and a high premium charge per $1000 of insurance. As nearly as experience and mathematics can measure it, every policyholder receives what he pays for.

Much the largest number of cases which have been submitted for our consideration are based on insurance originating, if not continuing, under assessment or renewable term policies. Their apparently low price was attractive to the purchaser at the time but, as the event proves, that advantage was outlived by their owners. Life insurance is one commodity, if we may use that word in connection with a contract for service, that must be paid for to the last cent. It cannot provide the proverbial something for nothing. Its miracles are those of the multiplication table.

People contemplating insuring their lives should look both before and after. They are about to enter into a contract extending, perhaps, over the period of their entire lives, or, at the shortest, a number of years. The provisions they are making must conform as closely as possible to their present and future ability to maintain it, in combination with their existing and continuing need of it. Few mistakes are probable, under average human conditions, with an Ordinary Life policy (premiums payable thruout life or during a specified term of years) the dividends on which are assigned annually.

But the main thing is to start right if future trouble or annoyance is to be avoided.

Mr. Stone of the American Union

James F. Stone, former president of the failed American Union Fire Insurance Company of Philadelphia, who was in Europe at the time the examiners of the New York and Pennsylvania Insurance Departments announced the company's insolvency, has returned, and from his home in Pitman, N. J., has issued a statement declaring that he was betrayed by his board of directors and that, unless he is interfered with, he will reorganize the company and put it in good standing again. This is cheering news for the creditors, and they will doubtless pray that no one will interfere with him, particularly if in the rehabilitation their claims receive proper consideration. But from our viewpoint, the outlook is not reassuring.

Mr. Stone asserts that when he got news of the trouble while he was abroad he cabled the directors that he was ready to pay in the sum of $250,000 to save the company. This is the first time that fact has been made public and it becomes the duty of the directors to explain why they did not accept the offer if they received it and knew that the one making it could deliver the money. Under the circumstances it would appear that Mr. Stone should have sent the money anyhow and rescued the company in spite of the undutiful directors. As a matter of truth, the directors have something to explain respecting the untoward haste they made in placing the company in the custody of a receiver.

The former president insists that the annual financial statement he signed and swore to was correct. This is a puzzling assertion when taken in connection with the findings of the official examiners. One or the other of these conflicting representations evades the truth. For the sake of the creditors it is to be hoped that Mr. Stone is right and that he can save the situation.

Workmen's Compensation

The New Jersey Senate has passed Senator Edge's bill amending the existing workmen's compensation law, simplifying many of the legal proceedings and providing better means for facilitating the payment of some claims.

FINANCE & TRADE

Losses by Flood and Storm

The effect of last week's great losses by storm and flood upon the prices of securities at the Stock Exchange was not depressing. In a narrow market (only 1,641,200 shares) there was but little change until the closing days, when an advance, with considerable strength, was shown. For the three stocks with respect to which nearly 56 per cent of the trading was done, the net additions were as follows: Reading, 5⅞; Union Pacific, 5½; Steel, 2⅞. It may be recalled that immediately after the San Francisco earthquake prices fell from five to fifteen points. But in that case there was a loss of about $400,000,000, the market had been active, and prices were depressed by sales which insurance companies found it necessary to make. At the beginning of last week, the market was in an exhausted condition, owing to foreign complications and pending or projected legislation relating to the Stock Exchange. In the closing days there was better news from Europe, and it became known that storm and flood losses had been overestimated. Omaha's tornado loss, for example, fell from $12,000,000 to $5,000,000, and Governor Cox's assertion that the flood losses exceeded the loss at San Francisco was shown to be unwarranted.

Estimates of the entire loss in the West range between $50,000,000 and $200,000,000. At the present time it appears that the total does not exceed $100,000,000, but some additions must hereafter be made on account of floods in the Ohio and Mississippi Rivers, in northern New York, and elsewhere. It is thought the loss of railroad companies is from $35,000,000 to $50,000,000. In Ohio and Indiana there is a great railway mileage. Many costly bridges have been swept away, roadbeds have suffered by reason of washouts, and traffic has been stopped. Some of the new bridges will be heavier and more expensive than the old ones. There have been losses for telegraph and telephone companies, trolley lines, gas and water corporations. It is said that in Nebraska alone there was tornado insurance involving $300,000 of annual premiums. There must be considered also the losses in dwellings and public buildings, and those of retail merchants. Collections may be affected, and the interest rate may show a hardening tendency.

The steel industry is temporarily affected. At the end of the week seventy of the eighty furnaces in the neighborhood of Pittsburgh were out of commission, 80 per cent of the steel-making capacity in Pennsylvania, Ohio, Indiana and Illinois was reported to be idle, and 150,000 employees were out of work. Eventually there will be compensation, to some extent, for many new steel bridges must be built. About one-quarter of the winter wheat acreage is in the area affected by floods, but the prevailing impression is that the crop will not suffer greatly, except in places where the plants have been uprooted. We have spoken of the losses of retail merchants. In many instances these have been severe and even ruinous. At this time of the year stocks in hand for the spring season are large. The new goods have been made unsalable, and a considerable number of commercial failures may be expected.

Financial Notes

Statistics compiled by the express companies show that the companies have lost from 22 to 25 per cent of their business in parcels up to 11 pounds during the first two months of the parcel post.

The Department of Agriculture says that Argentina, Chili and Australia have just reaped crops of wheat of fine quality and exceeding those of last year by 40,000,000 bushels. Argentina also has very large crops of oats and flax.

Two weeks ago a seat, or membership, in the New York Stock Exchange was sold for $41,000, the lowest price in twelve years. The highest price paid in 1912 was $74,000. It was reported last week that eight seats had been offered at $39,000, and that several brokerage firms had decided to go out of business.

Recent official reports show that Canada has 1035 butter factories, with an annual output valued at nearly $14,000,000; 2154 cheese factories, producing 162,450,000 pounds, value, $17,524,000, and 436 factories making both butter and cheese, their output of butter having a value of $1,870,000, while their cheese output is 37,453,000 pounds, worth $4,063,000.

The Way of Impotence and Rage

It is plain that the world has been morally and intellectually disturbed by the violence of "the wild women." Men and women of blameless lives hitherto are all at once hesitating to condemn hoodlumism, arson, bomb-throwing and assault with homicidal intent. They are even unwilling to speak in sharp condemnation of the threat to use political assassination in the cause of "votes for women."

If one of these gentle souls is cornered and pressed for a rational justification of his sympathy with violence, he falls back on the wild women's assertion that "other methods have failed." In this reply there is a twofold assumption. It is assumed that the assertion of the wild women can without challenge be accepted by sane, prudent and truth-loving people. It is assumed secondly that "the cause" is one of such moral consequence that it must, without question, be waged by the methods of destruction and deviltry if legal and educational methods have failed in fact. And back of these assumptions lies another, which is the actual working philosophy of all lawless innovators and their sympathizers, namely, the world-old, discredited assumption, many times slain but refusing to stay dead, that the end justifies the means.

This philosophy comes back to life as often as it is slain, for the good reason that it is one of those quibbles which are false when read one way and are quite true and useful when read another way. Means of every description must find whatever justification they have in the ends contemplated. They are nothing in themselves. But there are ends and ends, and for men and women of common sense the question can be raised only in the form, What ends justify what means? Men of ordinary sense would not demand that an express train be held up at a cross roads to buy candy for a shrieking infant. Men of ordinary sense, if born outside of Siam, would not have left the Queen of Siam to drown because her person was too sacred to be touched by other hands than her own.

Are there, then, any principles of common sense available for the guidance of conscientious folk who are not quite sure whether the wild women should be repressed or encouraged. We suggest that there are at least two.

One is that a worthy cause should not be promoted by means which, on the whole, don't work.

It is easy to sneer at history if you have worked yourself into a fine, fanatical frenzy; but if you are still calm and keeping your common sense with you, you will probably admit that the reason why the burnt child dreads the fire may be found in the fact that the child has been burned. Now, it happens that the teaching of history upon the effectiveness of sporadic violence is remarkably clear. Sporadic violence usually delays, sometimes for long periods, the cause in which it is used. Great Britain has an unmistakable instance hourly before its eyes even as the rage of a wild woman is. The Phœnix Park murders put back the cause of Home Rule in Ireland for at least one whole generation.

The other principle of common sense that should guide us in these matters is that the homely knowledge which serves us every day should not be thrown overboard when we are brought face to face with things exciting and perturbing. In our every day life we never permit ourselves to mistake rage for power. We remember that rage is an involuntary confession of ignorance, weakness and failure. We know that the boy who in fury smashes his toys does so because of his own inability to make them go or to stand up as he wants them to. We know that the driver who beats and curses his horses does so because of his own unfitness to manage them. Why, then, do we forget these simple truths of experience when we are sizing up the "movements" and "reforms" that sweep multitudes of excited men and women into their currents? What reason have we to assume that collective rage has any different or more respectable origin than individual rage?

No reason whatever. Like individual rage, collective rage is a product and a confession of ignorance, stupidity, inadequacy and failure. In the whole history of the race no really great reform has failed to appeal to the intelligence or to the conscience of mankind. No supremely great reformer has ever failed to draw men to his ideals and standards by touching their hearts and convincing their understanding. And when a cause is unable to make headway by the appeal to reason and conscience, one of two things may be said about it with absolute assurance. Either there is something wrong with the cause, it is not inherently reasonable and right, or it has not yet produced advocates of sufficient intellect and disinterestedness to make men see that it is reasonable and right.

It may seem like a harsh thing to say, but we think it ought to be said: in all generations the advocates and exemplars of violence as a means of promoting social reform have been "cracked" or intellectually inadequate, or both. Many of them have been criminally insane, as doubtless some of the suffraget women are today. The others have belonged to a mental variety which the psychologist might very properly isolate, label and study. It may be described in general terms by the layman as a variety of mind which is inordinately vain and desirous of a spectacular career, while at the same time it is conscious of hopeless inadequacy. It is habitually in the state that the child is in when he can't make his toys stand up or go as he wants them to. It knows that it lacks the divine power to enlighten, to convince, to persuade and to convert. In the bitterness of disappointment, impatient and furious, it gives itself over to blind rage, and inanely wears itself out with kicking against the pricks.

These principles have other applications than that which has suggested their enunciation.

California Pertinax

California's pertinacious, provocative attitude toward Japan is the only occasion and threat of hostility with that empire. There is no other cloud in the far eastern horizon, only this which paradoxically arises in the near west. There is nothing else to give countenance to Congressman Hobson's prophecy of war.

But again California insults and provokes the only country with which war is ever talked of, as if she did not care what might happen. The bill before her Legislature denies to an alien who does not declare his intention of becoming a citizen the right to hold land, and this is directed against Japanese, who are not legally permitted to become citizens. They can, under the bill, hold land for only a year, and at the end of that time the land escheats to the State unless the owner has made such intention to become a citizen, which a Mexican can do, but not a Japanese.

This bill, with possible amendments, is likely to pass. Governor Johnson and all the Congressmen from California favor it; and yet we are told that the majority of the Californians do not favor it. They are willing to gain the advantage of cheap labor and cheaper food. The support of the bill comes from the labor unions and the farmers, who do not want competition and who wish the prices of foodstuffs kept up.

Japanese would not raise garden prod-

ucts if people did not want to buy them. Nobody compels them to buy. The fact that they buy is proof that they want the Japanese. And Japanese are human beings, with as much rights as the whitest Californians. We may need a few more Socialists, or Christians, to teach us international brotherhood and the meanness of class or race selfishness.

But there is another side to this that ought to appeal to California, as it did when that State proposed to exclude Japanese children from her schools, and when President Roosevelt made his manly appeal to the Governor to prevent such invidious legislation. We have a treaty of friendship with Japan, and that treaty provides that the citizens of either nationality may own or lease houses or land for residential, business or commercial purposes in the territory of the other nation. If the treaty does not mention agricultural land specifically, the bill would yet contravene the treaty, inasmuch as it forbids the holding of land for any purpose whatever, and it would, we presume, be annulled by the Supreme Court. But it ought not to pass. The President should use his influence against it. The decent people of California should protest against it. Every lover of peace and good will between the nations should add his protest. The whole country, except it be California, respects Japan and wants Japan to be kindly disposed toward us. It is very unfortunate if a single State can injure and provoke a friendly nation, and the federal government have no power to prevent it.

The Flurry in the Episcopal Church

The old Latin adage, *Humani nihil a me alienum puto* is the best of all laws for the editorial profession. It tells us that nothing of human interest should be foreign to the teacher or master of affairs. Accordingly, the present flurry in the Episcopal Church is of interest to us and deserves comment.

The Rev. Mr. Royce's article opens it to our readers. Already the Episcopalian journals are full of the question whether the General Convention, which meets in this city next October, should change the name of the Church by omitting the word *Protestant* and inserting in its place *Catholic*. The objection presented by Mr. Royce is valid, namely, that it would introduce confusion because another body already has that name. Certainly the denomination which bears the name of the Protestant Episcopal Church is not catholic in the sense in which the Roman communion is catholic. But on the other hand, it is not Protestant. It has stopt protesting, as have all our other Protestant bodies. That means that the word *Protestant* has lost its etymological meaning. It no longer suggests hostility to the Pope. The Protestant denominations are going about their own business, and in their churches you will hear ten protests against civic corruption to one against their ancient enemy. Protestantism simply means the Churches which are not subject to the Vatican, nothing more, and one of them is the Protestant Episcopal Church.

There is, however, a wing in the Episcopal Church which hates this name of *Protestant* because they really are more inclined to the Catholic Church than to their Protestant sister Churches. They admire its history, they like its authority and the lofty claims of its priests and bishops. They like to call themselves priests, and they put much stress on the succession from the Apostles and the mystical efficacy of the sacraments. They approximate Rome, and they envy the name of Catholic. Their spirit is more Catholic than Protestant. They occasionally secede to Rome, as did several students in the General Theological Seminary not very long ago, and as in England a band of Anglican monks at Caldey, and a sister convent of nuns, have just now gone to the Mother Church. The more extreme Low Churchmen wish more of them would go and leave the Church at peace; but they are wrong. The Protestant Episcopal Church ought to be broad enough to hold all sorts in agreement or debate, High and Low, Ritualist and Evangelical. So ought all other denominations to be equally broad. Such differences are not essential, not nearly so important as their polemics would suggest. Christianity is something deeper. Men have different tastes, and all should find room in a Church catholic enough for all.

Because it is not catholic or Catholic it is not likely that the General Convention will give that name to their Church. The name *Protestant* is not a beautiful one, but it is no longer a quarrelsome one. It is not a name to cling to, but it will do till a better one is found. For practical purposes, the *Episcopal Church* is a good enough name. The popular designation has wisely discarded the word *Protestant* as applied to it, and has discarded the word *Roman* as applied to the Catholic Church. Why not let it rest there?

Tariffs and the Cost of Living

In 1909, when the Republican party, at the beginning of Mr. Taft's term, set out to revise the tariff, the American people were complaining of the high and rising cost of living. They expected that reduction of tariff duties would give them relief. By that sham revision, in 1909, the free list was enlarged and the average rate on dutiable imports was slightly reduced. The cost of living was not perceptibly affected by the changes that were made. The people were disappointed and angry. A political revolution, in 1910, gave the House to the Democratic party by a large majority. But if the Republicans had revised the tariff sharply downward, even then there would have been widespread disappointment, for the effect upon the cost of living would have been slight.

The main causes of the increase of the cost of living were not to be found in the tariff. They were worldwide, and the Republican leaders might have made a better defense of their course if they had undertaken to show what these causes were.

A sharp downward revision of the tariff is now at hand, with a further enlargement of the free list. It is expected by a majority of the people that by this revision the cost of living will be so reduced that the reduction can easily be measured. It is quite probable that they will be disappointed again.

Provision for an investigation and a report concerning the causes of which we have spoken should have been made long ago—an investigation by an international commission of experts. A bill for such a commission was passed in the Senate at Washington, but no action upon it was taken in the House.

Prof. J. Pease Norton, in an article on measurements of the changing cost of living, publishes tables of index numbers indicating the average prices of representative commodities. We give one of these tables below:

	American Index numbers.	Foods.	Other commodities
1896	87	81	95
1897	89	83	88
1898	95	93	93
1899	103	100	102
1900	112	105	112
1901	109	105	114
1902	118	126	117
1903	115	117	119
1904	116	105	112
1905	118	112	121
1906	124	119	131
1907	132	121	140
1908	124	129	124
1909	133	140	126
1910	137	140	133
1911	130	136	124
1912	138	148	131

Commenting upon these figures, he says:

From the average of the low years, 1896-7, down to 1912, the food group has advanced 80 per cent, and the "other than food" group 43 per cent. Thus, compared with the two low years, 1896-7, foods have advanced nearly twice as much as other commodities. Consequently, the hardships experienced by the classes of the smaller incomes have been very great thruout the world, inasmuch as in all family budgets the percentage spent for foods increases as income diminishes.

It cannot reasonably be expected that the tariff changes soon to be made will considerably reduce the cost of food. When it revises the tariff, the Democratic Congress should also provide for an international inquiry, by competent persons, as to the causes of a movement which such legislation cannot greatly affect.

The Unreturning Brave

War is hateful, horrible, and we will never cease to lament it and fight it. And yet war can, at times, bring out the noblest instincts that hide in human hearts. So close are the evil and the good nestled together.

The tale reported this past week of the attack by the Montenegrins on Tarabosh Hill, which commands the city of Scutari, is such a story of unsurpassed courage. It was defended by brave Turks. To stop the onrush of the besiegers the nearer defenses, at the top of the steep hill, were surrounded by a network of barbed wire. The hill must be taken. The honor of the men of the Black Mountains required it, for had they not the name of being the bravest of the brave, and the Greeks had taken Yanina, and the Bulgarians taken Adrianople, and should the heroes of Montenegro fail to capture the stronghold assigned to them, and should Montenegro fail to gain the Albanian prize of her enlarged territory? It must be taken. That wire entanglement must be cut at whatever cost of life.

Then three hundred men, representing every regiment, stept forward to do and die; three hundred volunteers, as many as the heroes of Thermopylæ. They could carry no shields, no armor, for the ascent was steep and difficult. They must lay aside musket or sword, all the usual implements of war, and take but the tools of a peaceful trade. Against a raking fire, unprotected, in face of sure death, they scrambled, they climbed up that hill, those that fell not, they reached the wires, they cut, they pulled, they opened the way for the army that followed, and the chief defense was taken. But not a single one of them entered the breach and shared the wild joy of the victory; every one of them fell dead. They expected it; they knew it when, selected out of those who volunteered, they stept forth and offered their lives as a sacrifice for their country.

Such was the sublime offering of himself to save Switzerland from her oppressors when Arnold Winkelried gathered a wide sheaf of spears in his breast and "made way for liberty and died." So stood the three hundred of Leonidas in the defile and withstood the Persian host that would invade Greece, and all died, one only escaping to save his life and lose the glory. So went the six hundred of Balaklava into the valley of death, and returned, but not the six hundred. With these heroes of patriotism and war will to all ages be told in song how with ignoble weapons these charged the hill, opened the way to other victors and died for their native land, not one escaping.

When such a deed of patriotism and courage is immortalized in story and song, is it any wonder that a blaze of glory shines about the horrors of war? What is so precious as life? All that a man has of gold will he give for his life; but there are those who hold not their very lives dear to themselves in comparison with country and honor. What will be the grand pride and what the tears of the wives of these patriot heroes? So close do joy and sorrow lie hidden in the human heart.

Ambassador Page

Nothing that our admirable President has yet done has better displayed his political genius than the selection and appointment of Walter H. Page as the next American Ambassador to Great Britain.

This highest post in our diplomatic service has always been held by the American people in peculiarly high estimation. The best man in the country was none too good to represent us at the Court of St. James, and we have almost invariably sent there the highest product of our national life.

Mr. Page is no exception to the rule. Tho not endowed with the golden personality of Choate, nor with the supreme literary gifts of Lowell or Hay, nor with the fortune of Reid, he is, nevertheless, a more representative American than any one of them.

Mr. Page has two exceptional qualities that will be of incalculable benefit to him in his new post. He knows both physical and intellectual America probably better than any one else in the country. In his capacity as editor, lecturer, educator and investigator he has visited practically every section of the United States, while the *World's Work* bears witness that there is no abler, kindlier or more illuminating interpreter of the main currents and achievements of our contemporary life than he. Our English cousins who really want to know the best that is being thought and done in the United States have only to consult him.

We may, therefore, confidently expect

the people of the United States to be represented for the next four years in England by a typical American gentleman, modest, agreeable, sane, cultivated, efficient and democratic.

There is something of Abraham Lincoln in the personality of Walter Page.

Recognition of the Chinese Republic

This week, as we fully and gladly believe, the Republic of the United States will recognize and welcome China as a worthy member of the sisterhood of republics. Further, at the request of President Wilson, other nations will join in this recognition. It has been delayed too long, considerably over a year. Do our readers remember that when Panama seceded from Colombia and proclaimed itself a republic it took only three days for President Roosevelt to give it formal recognition? That was speed, regarded by not a few as unseemly speed, as if the investigation of fitness had been made antecedent even to the secession of the state whose independence would be welcomed by us. With China we have been more deliberate, too deliberate, and have waited for a concert of the Powers, and the election of a Congress, and the choice of a President other than provisional. We have been very slow, but rejoice that our Democratic President has not prolonged the delay. THE INDEPENDENT urged immediate recognition, because we had faith in China, and we urged our Government to give all the help possible to the mightiest of republics, or of nations, in the hour of its peril. This help to a sister republic was not given, and China proved her purpose and permanence without our encouragement.

That China is a republic is due to the wisdom and energy of one man, Dr. Sun, a man who had learnt his lesson of liberty in our own country. His patient daring has made him a man unsurpassed in the opportunities of enormous influence over the world. By his act, and by the less conspicuous work of hundreds of other sacrificial men, China is becoming rapidly Americanized, westernized, endowed with the world's best civilization; and the rest of the world is following. No other transformation can ever be both so mighty and so sudden as that of China, altho that of Japan may be compared to it. Japan has the credit of priority; and, if not a republic in form, she is a republic in fact. Her example gave China a larger courage.

And we believe China will prove worthy of her place in the family of nations, and she will have the kindliest sympathy of our own country. That sympathy was shown in the purpose we had in joining the group of six Powers to aid Chinese finances, and more wisely in withdrawing thereform. We rejoice that China is so earnest in suppressing the opium evil, and therein, as is not generally known, she has American aid. President Yuan has lately appointed an American, the Rev. Edward W. Thwing, as official adviser in the suppression of the cultivation and traffic in opium, and Mr. Thwing has organized a Department of Social Service, of which President Yuan is the Patron. We hear of soldiers sent to dig up opium fields, and England does not know what to do with her Indian product, that remains unsold in Chinese ports. The new republic is the wonder of the century, and the annihilation of the opium evil is likely to prove the greatest moral victory of our times.

Two Feminine Campaigns

It is a pity of all pities that when Great Britain has a Ministry and Parliament resolved, as never have Parliament and Ministry been resolved before, to right long wrongs and put justice in place of injustice, and when they are taking up one cause and case after another against the greatest opposition, each in its turn—for each must take its turn—and when Parliament and Ministry are willing and even eager to give its turn to votes for women, a class of women are so short-sighted that they cannot bide their time, that they cannot wait as Ireland has waited, and Wales has waited, till the chance could come. Cannot women practise the patience of hope?

Not women of the Pankhurst type. If they do not get what they want immediately they will fight for it. They can't fight as men fight, but they will destroy property, burn houses, and now will not

even draw the line at life. They are so enraged, so infatuated, that reason has left them. The sentence of Mrs. Pankhurst, which seems perfectly justified, to three years' imprisonment with hard labor, is resented with nothing less than impassioned fury. She will starve herself till released, and they will not hesitate to kill. It is a condition of horrible mob-madness, which we pray may not invade this country.

Of course, Mrs. Pankhurst's demand of votes for women is just. So far she is right. We can imagine a condition in which we might even look with leniency on her method of warfare. It is a woman's method, not a man's, and women have as much right to fight as have men, in case of oppression; and the refusal of the right of representation is oppression. What we claim is that this recourse to force, to fire and bombs, is foolish, crazy, because it is untimely. These British women have not tried instruction and persuasion to the limit. Their method awakens attention to their cause, and so is in part helpful; but their way is not the way the end has been gained in Australia and Colorado. Our women's way is better.

To illustrate our way, we take not the great successes in so many States, but the appeal to Congress on Monday of this week. It is so fine as to be amusing. They asked permission, 631 of them, to present petitions personally to Senators and Representatives in the rotunda of the Capitol, and it was granted. So they came, each addressing the man of her district or State, Mrs. La Follete pleading to her husband, the Senator, that she might be given the ballot; Mrs. Nelson to Representative Nelson, of Wisconsin; Mrs. Roberts to Representative Roberts, of Massachusetts; Mrs. Kahn to Representative Kahn; Mrs. Taylor to Representative Taylor, and Miss Morgan to her father, Senator Morgan, of Alabama. "It is to laugh," and a smile is quite as good a weapon as a bludgeon or a bomb.

A Good Man in Bad Company

It is reported that Francisco de la Barra, Mexico's Minister of Foreign Affairs, is about to visit Washington, hoping thus to hasten there a formal recognition of the Huerta Government.

Nearly forty days have elapsed since President Madero and Vice-President Suarez were put to death, and since Huerta promised that there should be a thoro investigation, with punishment for the guilty. Nothing has been done, except that the commander of the "escort" accompanying the two men when it was said that the party was attacked in the street has been promoted. It is difficult to resist the conclusion that Madero and Suarez were murdered by the men who had deprived them of their liberty.

Abram Gonzales, Maderist Governor of Chihuahua, an intimate friend of Madero, arrested for sedition, was murdered "while trying to escape." Rivera, Maderist Governor of Sinaloa, also arrested for sedition, was taken from Mazatlan on a ship. He speedily "fell overboard" and was drowned. Zepeda, Huerta's nephew and Governor of the Federal District, dragged the Maderist soldier, Major Hernandez, from a prison cell in the capital city and murdered him. He had set out to murder three imprisoned Maderist Governors, but they were saved by the prison warden at the risk of his own life. Ancona, Madero's secretary, it is now said, was taken from an outgoing ship at Vera Cruz and shot. That veteran soldier, General Trevino, is in custody, because he resigned as Governor of a State, and we shall not be surprised if we hear that in "trying to escape" he has been shot down.

Why should Francisco de la Barra, scholar, expert diplomat and gentleman, be associated with Huerta and those who stand around him? Why should he, at home or abroad, represent such a Government as Huerta's? Is he coming north to promote a recognition of the confederated assassins, or because he longs for the comforts of civilization?

The Life of Books

Tho the number of books published, especially of works of fiction, religion and government, has increased by leaps and bounds in the last decade, the number of books *sold* has not materially increased. This fact is the text of an article by Mr. George P. Brett, president of

the Macmillan Company, in the current issue of the *Atlantic Monthly*. Indeed, Mr. Brett writes that the outpouring of novels is so great that the "life" of a best seller is now little more than a month, as compared with a period of popularity extending over several years, such as was once the rule. Mr. Brett blames the short life of fiction and the short sales of poetry and other dignified forms of literature upon various conditions, one of them the decline of bookish conversation. "The late Goldwin Smith," he observes, "the last time the writer saw him in New York, remarked that he had not heard a book mentioned at a dinner table for several years."

But that, of course, is not the only condition to blame for the relative stand-still in American bookselling, while the sale of motor cars and safety razors and cigarets ascends by leaps and bounds. There is the failure of publishers and booksellers to devise new and efficient methods of distribution, to correspond with newer conditions in American life. And there is the relative dearness of American books: a consideration upon which THE INDEPENDENT has commented more than once. But what is the remedy?

The only one which the publisher recommends in detail is the issue of large editions at "popular" prices of all works that justify or promise to justify such issue. This unfortunately means lower royalties nominally for authors, but is in theory more than compensated by the far greater volume of sales upon which royalties may be based. Mr. Brett might well have added that his own company has made notable progress in this direction, in issuing such works as Lafcadio Hearn's *Japan: An Attempt at Interpretation*, and agricultural books by Prof. Liberty H. Bailey, and novels by James Lane Allen and others, at a price less than half that of ordinary duodecimo volumes. These are, of course, copyrighted works. In the case of older texts we have such excellent series as the Bohn, Everyman's Library, the Universal Classics, the Muses' Library, etc. But probably the reading world cannot progress if it is confined in its economies to books originally published a half century or two centuries or twenty centuries ago. The questions which Mr. Brett raises in the *Atlantic* are interesting to all readers of books and they should interest the makers of books, above all. That there are many of these is suggested by the fact that from eleven to fourteen thousand volumes are now annually published in the United States alone, and that this stupendous figure represents perhaps no more than two per cent of the total number of book manuscripts submitted to American publishers for publication.

The service of a journal which, like THE INDEPENDENT, is old-fashioned enough to sift this enormous output of the presses, presenting to readers estimates of the value of those works in all fields and literatures most likely to interest or instruct alert men and women, is indeed considerable. We pride ourselves that these estimates are, in our own case at least, unprejudiced and thoughtful, in spite of the increasing difficulties of the task as the volume of books rises flood-like year by year and month by month, burying the literary editor's desk under rivers of writing ephemeral or immature. In our opinion, one detriment and deterrent to intelligent book reviewing and book reading and book buying in America is the low standard set by many publishers in the field of fiction. Tho our stage is by no means distinguished, it escapes a vast deal of crudity by reason of the costliness of "producing" any play at all. A play that lives but a few weeks is too expensive a luxury for managers to risk any oftener than necessary; where the life of a novel, on the other hand, is one month, novels "kill" one another, both literally and figuratively. For if only two novels in a hundred are ever printed, perhaps it is only one in a thousand that is worth reviewing, buying or even reading. And no one would suffer—authors least of all—if critical standards were higher in our modern fiction. The modern cult of formlessness in novels is only one of the evils at which one is tempted to point an accusing finger. And if criticism is of any service it is, above all, in signalizing the most worthy fiction, stigmatizing the unworthy, and maintaining a discreet silence as to that fiction of which the life

is, as this publisher of high ideals writes, a space of thirty days.

Sham Universities

The annual reports of the Carnegie Foundation for the Advancement of Teaching always give important information on other subjects than the distribution of pensions to college teachers. One of those in the report just issued has to do with sham universities, and it gathers into a garbage-can quite a number of those which have been too publicly advertising the degrees they have to sell.

Too many of them have their headquarters in Washington, D. C.; and one of the most pernicious of them is the Oriental University. The president, who claims the degrees of Ph. D., S. T. D., S. O. D. (what is it?) and LL. D., is also dean and professor in a multitude of departments in its Orientalistic Seminary, West Asian, Indian, African, Oceanic and Amerindian, and is also head of a multitude of other departments, as diverse as religion, classics, theomonistic theology, the civil service, and he is professor of literature, journalism and drama, international law and diplomacy, and offers degrees in anything, even to aeronautics; and everything is taught—penmanship, Vedantic philosophy, psychic mediumship and spirit photography. There are twenty-three varieties of degrees offered, of course to non-resident students. And this is a university, incorporated under the laws of the District of Columbia; and has no property, no buildings, is a structure of froth, but seeks dupes on the published claim that its graduates "will not fail in a competition with the graduate students of Berlin, Oxford and Harvard universities."

Then there is the Carnegie University, of Wilmington, Del., which claims to have affiliated with it a number of educational institutions elsewhere; and it gives pictures of them, with "Carnegie University" in great signs across the front, which are really office or apartment buildings, and carry no such sign. It offers five courses, the announcements simply copied from the catalogs of reputable institutions. Of course, the object is to get money from ambitious fools or knaves for bogus degrees on a pretense of teaching by correspondence. The president, we are told, had been convicted of the illegal practice of medicine, and later arrested for using the mails to defraud, and forfeited the bail and is a fugitive from justice.

There have been a multitude of such fake universities, for whose baccalaureates we have no pity. The most amazing title is one in Latin, which we translate, the Veterinary University of Arabian Glanders, which, we take it, appeals to horse doctors. Then there is the National College of Osteopathic Physicians and Surgeons, which, when incorporated in 1897, certified to property of $272.50; the Washington Christian College, which in 1911 certified to $700; and the more opulent American International University, which certified to real estate, in Mexico, valued at $31,000. The names of these sham universities as given in the report are legion, attracted to Washington, such as the American Capitol University, the University College, the Potomac University, the North American University, Washington University, and so on, which we may assume were organized just to sell degrees; and one, Monroe College, specifies over sixty degrees to be offered.

Now, what should be done to get rid of this nuisance, this fraud? Congress governs the District of Columbia, and the present law allows these shams to be incorporated. The Carnegie Foundation suggests that any college seeking incorporation should prove that it possesses property of at least $20,000, and any university at least $100,000. This is modest enough. Congress should pass such an act, and so should every State. At present only three States—New York, New Jersey and Pennsylvania—have any such law.

In Brief

The progress of prohibition is seen in the fact that there are now in this country more than 500 cities and towns with a population of 5000 or more in which the sale of alcoholic liquors is forbidden, and nearly 200 of them have over 10,000 population. There are nine States, with a population of nearly 15,000,000, whose people have

adopted prohibition. They began to talk of a prohibition amendment to the Constitution, but the time for that is not yet, altho nearly the last law under President Taft was to aid prohibition States to prevent the introduction of the poison. And yet people still say, what they say of the social evil, that the alcoholic evil has always existed, always will exist, and that the only way is to segregate it, localize it in poor quarters, and shut it out of the respectable residence districts.

It is a very curious fact brought out in a bulletin by the Bureau of Education that in the secondary schools of Latin America Latin is not included in the curricula. The exceptions are, in Haiti and Columbia, where Latin is taught to a limited extent. In the universities the teachers of Spanish and French literature are, at least in Chile, required to have acquired a knowledge of Latin, but not their pupils. In some countries it is positively forbidden to teach Latin, altho one would think that in Latin countries the language would be favored. Probably the reason is, that the system of public education is a protest against ecclesiastical education and Latin is thought of as an ecclesiastical language.

The new income tax law in Wisconsin, and elsewhere, perhaps, requires all business corporations to take an annual invoice the last days of December in order to report January 1. Christmas shopping has kept merchants and clerks on the jump for six weeks, until all the girls are thoroly tired out and the boys and men pretty well used up. Heretofore they have been able to look forward to a rest-spell after Christmas, but now they must double their labors into midnight hours, after business has closed for the day, in order to get that invoice ready in time. The law should be changed, making the income year begin February 1. The remedy is simple.

Mr. Porter L. A. Ferguson has a grand agricultural scheme which he will back with $5,000,000. In the woodland region of north-central Wisconsin he has purchased 80,000 acres of fine land, and he will open it up to selling eight-acre farms to Scotchmen, on long terms of payment, and establish an agricultural college, and require and teach the very best methods of farming, and supply in advance houses and buildings and stock. He plans to create a model farming community. It is a kind idealism that wisely carried out will succeed.

The story of the secession to Rome of the Anglican Augustinians of Caldey fills the English ecclesiastical press. The reason they give is that they wanted to be under more authority, to enjoy more submission, to be obedient. So, of course, they had no place in a Protestant Church and they left it, just as a multitude of priests, not a few of them members of the religious orders, have left the Church of Rome, because they thought they ought to have the right of private judgment. Let each go, for peace's sake, where he belongs.

Montenegro dares all Europe, and, what is worse, dares Austria; and her king says she cannot yield, but must take to herself the territory the Turks took from her three centuries ago. It is sublime courage. The combined Powers can blockade but will not invade the land to drive back the Montenegrins; but Austria threatens it. It is none of Austria's business. She has already taken Bosnia and Herzegovina by force, and is determined to control the proposed state of Albania.

The accidental descent of a German dirigible in French territory was an incident that might have produced very unhappy results, and which may yet be personally unhappy for the officer in command. But the French Government behaved in a very handsome way. It was not made a prize, nor, we are told from German sources, was advantage taken of the opportunity to learn the German secret, and no officer inspected it. That was high French honor and courtesy to a dreaded foe.

President G. E. MacLean, of the State University of Iowa, calls for a standard reorganization of our higher education, since the increasingly high professional standards make the graduate twenty-six or twenty-seven years old before he can begin to practise his profession. Then the proper remedy is not to reduce the standard so much as it is to begin education earlier, and to save a year, at least, in learning to read and spell, by the use of a phonetic alphabet.

If the German Government succeeds in carrying out its plan for the storage of $90,000,000 in gold in the Julius Tower of the Spandau Fortress, that means the withdrawal from circulation of about one-seventieth of the world's supply of its monetary basis. Query: What effect will this have on the cost of living?

One who takes an evil risk must not shrink from taking the consequences. If the English suffragets set Britain aflame they must not fret about going to jail. If Julian Hawthorne robs investors by false reports no mercy should be asked for him if he is sentenced for a year. It is mild punishment.

Mr. Morgan's Career

An Analysis of the Character Underlying His Financial Achievements

By A. D. Noyes

[Mr. Noyes writes from long knowledge of American finance. For twenty-two years he has been financial editor of the New York *Evening Post*. An Amherst graduate, he has lectured on economic subjects at Harvard, Illinois and New York Universities. In 1898 he wrote *Thirty Years of American Finance*, extending the history in 1909 to cover the additional decade. His pamphlet, *The Free Coinage Catechism*, circulated widely in 1896.—EDITOR.]

Few important characters in American life of our day, and few important careers, have been subject to more dispute, as regards their influence on American affairs and American ideas, than those of J. Pierpont Morgan. That he was, perhaps with one exception, the most striking and interesting figure of the day in American affairs—at all events, the figure that most imprest itself on the public imagination—there can be no doubt whatever. On that point all of the critics, favorable and unfavorable, agree. This is true, moreover, in an international sense. A cable appreciation, sent on Monday to a New York newspaper by a well-known correspondent in Lombard Street, described him as having been, to the average Englishman, "The personification of America's wealth, energy and financial organization."

The characterization did not overstate the case. In 1901, when Mr. Morgan undoubtedly reached the climax of his financial prestige, his power and achievements were looked upon, not only in New York, but in Europe, as something akin to necromancy. Even in the discussions of eminent foreign financiers there seemed in those days to be an underlying acceptance of the idea that something superhuman had to do with achievements so contrary to all precedent in the world's financial history. Those achievements, in fact, had followed one another to a rapid and bewildering climax during the few months preceding the organization of the Steel Corporation, and they were fairly capped by the floating of that billion-dollar organization in a way and on a scale which no financier in the world would have pronounced possible a year before.

At the same time, and in the United States, a spirit of adulation mixed, one might almost say, with a sort of superstition, pervaded the popular ideas and published comments regarding Mr. Morgan. It is not too much to say that no financial magnate in the world's history ever occupied so extraordinary a position of prestige thruout all financial communities, home and foreign, as he occupied at that moment. Afterward came the inevitable reaction, and it came with the greater force because the conception of his achievements which had previously prevailed had been based on very erroneous assumptions regarding the nature of those exploits themselves. Part of this misconception no doubt arose from the mere fact that a financier, whose previous history had been the embodiment of conservatism, had suddenly branched out into enterprises and undertakings of so daring and venturesome a character. When the visible reaction came on the stock exchanges in the market valuations of the huge combinations of capital whose stock had been inflated on so amazing a scale—when one of them turned out to have been so ill conceived at the start that it was never able to pay dividends, and when another, the largest of all, which had begun by paying 4 per cent dividends on its common shares, got into such a position that its common stock fell below 9 cents on the dollar in the market—the public attitude changed rapidly. Not merely were there then heard the qualifying views of sober critics, but the professional muckraker took a hand in the discussions.

As time went on, Mr. Morgan was held up to public view by those authorities as something like a robber chieftain. Whereas, even in 1907, popular discussion of his connection with the panic was surcharged with applause over the prevalent notion that Mr. Morgan, single-handed, had saved the day and rescued the structure of American credit, a year

later Senator La Follette was capable of rising in Congress and accusing Mr. Morgan by name of having deliberately caused the panic of 1907 for selfish purposes, and of having intentionally aggravated the situation by helping along the break of prices in the hour of crisis, in order to snatch personal bargains from the market. Still more recently came the Money Trust inquiry, obviously aimed at Morgan and at Morgan's dictatorship over American banking and industry—an inquiry which culminated in the extraordinary cross-examination of Mr. Morgan himself at Washington before the Pujo committee. Nowhere else perhaps can so clear a notion, both of Mr. Morgan's own ideas on finance and of the ideas of those who opposed him at all points, be so clearly ascertained as in the full report of that two-day hearing.

In such a case as this, the inquiry which arises in the minds of observers who wish to determine the real historical place of so important a public character is, What kind of man, from the point of view either of large finance or of social problems in general, was Mr. Morgan? Was his career useful and valuable to the fundamental interests of America, or was he, as his hostile critics have declared, a feudal despot in finance who had seized violently on the credit and natural resources of the country which should have been otherwise utilized for the benefit of the people at large, and who employed his enormous power to pile up wealth for himself and his associates at the expense of the average American citizen? I believe that I have not overstated the two alternatives which confront each other in this inquiry.

The inquiry involves three questions. The first has to do with Mr. Morgan's individual character. The second concerns the methods, financial and otherwise, habitually employed by him. The third has to do with the perhaps larger question of his ideals and judgments regarding the past, present and future of American institutions, and his own relation to them. In answering these questions, it must first be said that, from beginning to end of his career, he was an uncompromising individualist. He believed, and he embodied that belief in all his actions and policies, that the real prosperity of the United States was inseparably bound up with the interests of himself and his associates. This view, which is not unusual in high finance, but which has rarely been carried into action as it was by Mr. Morgan, may be correct in a given instance, but it is always probable that it will be incorrect in others. It is perfectly true that national prosperity is the only avenue to success for the enterprises of large bankers and investors. But that is another thing from saying that their own conception of their personal interests is the touchstone of prosperity, or that their ideas as to what is true prosperity may always be relied upon.

The danger in all such instances is that the man of powerful will and almost boundless resources will act on the basis of his prejudices, and while shaping his action in accordance with the convictions of his own reasoning, will refuse to listen to the teaching of enlightened students of problems of the day, when their conclusions conflict with his own. Such men will often acquire just public recognition as the embodiment of courage, patriotism and real achievement; but there will certainly be times when what is at one moment rightly described as resolution, constancy and public spirit, will fall into the category of obstinacy, and will end by clashing hopelessly with the intelligent, progressive spirit of the times.

Much of this characterization belongs to Mr. Morgan. As a confirmed individualist and a man of unbending will he brushed aside not only the opponents whom he encountered in his own field, but the critics who could not agree with his methods and practices. On the other hand, his career presents no parallel with that of the financial vampires who in their day were described as great Wall Street leaders, but whose actual operations in finance and industry were divided between building and destroying. Mr. Morgan never played this double role. Not only was he always an optimist, but, in intention at any rate, he was always a conservator. He was himself fond of repeating the maxim stated to him by his father, at the beginning of the son's career in American finance: "Remember that the man who is a bear on the United

States will always 'go broke.' " There can be no question, to those familiar with Mr. Morgan's history, that he held to this principle thruout his career. Moreover, in notable contrast with great numbers of eminent predecessors and associates in the high finance of Wall Street, he was never a double dealer, a cheat or a liar. His word was his bond, and was so recognized by the financial world at large, to a degree which has rarely been witnessed in the history of any other man. Whatever may be said as to the wisdom of the huge foreign borrowings of his house in times of extravagant financial promotion — they were estimated sometimes at $50,000,000, with only the name of his house for their security—the fact remains that operations on such a scale would have been inconceivable except on the supposition of complete confidence of the financial world in Mr. Morgan's given word and in his real ulterior purposes.

Mr. Morgan's financial methods involved use of the highest financial judgment of his associates, tho always along the lines of his own convictions; employment of the best financial talent in the practical working out of his ideas; and no stinting of expenditure of capital for a determined purpose. These preliminaries granted, his own imperious will dominated everything. That domination absolutely broke down the stubborn resistance of a large part of the banking community in such episodes as those of 1895 and 1901. In the earlier of those years, when Mr. Morgan undertook the task of protecting the United States Treasury from the exhausting drain of gold thru absolutely blockading the channels of foreign exchange and gold export, the highest experts in the foreign exchange community pronounced the undertaking impossible in the first place, and dangerous if it were possible. Mr. Morgan did not listen to them, but proceeded, first, with his plans of obtaining the personal acquiescence, willing or unwilling, of every banking house capable of financing large gold exports; next, with the necessary arrangements for borrowing in enormous sums abroad with a view to meeting the accumulating obligations which were not to be satisfied in gold, and, finally, with his protective operations on the domestic stock and money markets.

Similarly, in 1901, not only was the formation of the billion-dollar Steel Corporation considered by Wall Street itself a hazardous if not impracticable achievement, but when the moment came to form an underwriting syndicate which should pledge itself to take up and pay for all of the stock not subscribed for by the general public, the first answer of the financial institutions invited to participate reflected something like consternation. No one could tell how much of that new stock would come back upon their hands, and every one of them was aware that the operation as a whole was of questionable character, when undertaken by a fiduciary banking institution. Mr. Morgan's personal determination broke down all such opposition; the banks, the trust companies, and in the end the life insurance companies were enlisted in the undertaking, and their coöperation was brought about again when the Steel Trust financing was approaching a critical period and an underwriting syndicate with even more unfavorable prospects than those of the "first Steel syndicate" had to be prepared for.

Now, such determined overriding of timidity, of conservatism and of haphazard opposition will, in modern finance, have the best of results in at least some cases. With Mr. Morgan, however, its scope of operation was rendered more peculiar by one fundamental fault, perhaps inseparable from his training and character. If his financial projects and his public testimony regarding them are to be taken as evidence, he believed that capital, when accumulated in large enough amount and with sufficient concentration, can accomplish anything, and can bring about enduring results. Now, capital can accomplish much. Figuratively speaking, one may say that it can make water run uphill. But it cannot keep the water running uphill forever, and sometimes, in the vicissitudes of finance, it cannot make the water stay on the top of the hill. Mr. Morgan swept aside such considerations, ignored this basic fact, and thereby came about what must be classed as the notable failures of his career.

In 1895, for instance, while it is true

that his contract with the Government was exactly fulfilled, there was a larger implied contract, namely, that thru this damming up of the channels of exchange the United States Treasury would be placed in a position where it could deal thereafter on even and satisfactory terms with the money market. What happened, however, was that after the cornered exchange market had continued for a certain time to obstruct gold exports, merchants not previously engaged in the foreign exchange business on their own account entered that market, drew out the gold of the Treasury, and broke down the forestalling operations of the syndicate. In the end, the outflow of gold and the drain upon the Treasury were probably greater than they would have been but for the operations of Mr. Morgan's syndicate.

The results of the great promoting operations of 1901 were in their field even more problematical. An endless series of industrial combinations seemed to be on the cards, each involving the tying up of the market's capital resources on an enormous scale. First, a succession of amalgamations in the several branches of the steel trade were financed and capitalized on the basis of extravagant valuations for the stock which was to be sold to the general public. Next came the banding together in the Steel Corporation of all these other combinations, with the further drain upon capital and credit which was involved. A series of railway combinations, conceived along similar lines, came almost simultaneously, culminating in the famous Northern Securities merger, which was itself an outcome of the frantic contest between Mr. Morgan's party and that of Mr. Harriman for possession of one of the great railway prizes. Neither of these financiers took account of intrinsic values in this contest for control. At last came the so called "Shipping Trust" — the International Mercantile Marine—the conception of which has since been pronounced by the best authorities in that field as utterly unsound, but which called for $150,000,000 capital.

All these processes of amalgamation and exploitation involved necessarily a mad speculation on the part of the general public and therefore a continued strain on the money market's resources. It led with inevitable logic to the Wall Street crash of 1903, properly known as the "rich men's panic" because the men who had been engaged in these extraordinary operations were the parties chiefly embarrassed. It is true that the halt was first called when the United States Government intervened to stop the rapid progress toward industrial monopoly thru these trade amalgamations, but it is equally true that economic law and the financial markets themselves had intervened, before that, to stop the even more rapid progress toward exhaustion of the world's capital resources in the extravagant inflation of values. My personal conviction is that the challenge to these industrial amalgamations thru the Northern Securities suit under the Anti-Trust Law was what Mr. Jacob H. Schiff described it at the time—"a blessing in disguise"—and that if some such outside check had not been applied, the whole unnatural structure of inflated credit would eventually have been brought down in a collapse far worse and more lasting than that of 1907.

To what extent the same criticism holds true of the later power over banking combinations ascribed to Mr. Morgan it is more difficult to say. It is not true that this control represented wholly a selfish determination to establish monopoly over credit. Selfish motives may undoubtedly have existed in those operations, as they do in all such matters. But the fundamental fact is that Mr. Morgan's financial prestige, after 1907, was still so high that financiers and institutions naturally clustered about him and submitted to his dominating will when he chose to exercise it. But in such a situation dangers existed not altogether dissimilar to those which surrounded the industrial exploitations of an earlier period. It is a highly interesting question, how far the system of banking alliances which thus grew up was due to Mr. Morgan's personality alone, and how far to other causes and influences of the day.

As regards Mr. Morgan's ideas and judgments regarding American institutions, it may be said that they were those of an optimist and a patriotic citizen,

but at the same time those of a man whose attitude toward affairs was always regulated by his training and his prejudices. Mr. Morgan was a man of powerful intellect. He was never one of the unreconciled in politics. He recognized the changing aspects of American social and political affairs from generation to generation; yet, perhaps thru the very force of his character and of the circumstances created by his achievements, he was unable to adapt himself and his methods to such changes. Movements in our social or political life which obstructed projects which he believed to be the proper order of the day, he resisted—tho rarely, if ever, by the insidious methods of a Gould or Vanderbilt. But the mere fact of resistance, even when passive, embittered people on the other side; all the more so when the time arrived for popular comparisons of the enormous wealth achieved thru Mr. Morgan's undertakings with the pressure of high cost of living on the income of the average man. It was this which led to the extravagant assertions on the floor of Congress such as that of the member from Oregon regarding the 91,800,000 Americans who were "the industrial slaves of the remaining 200,000," and which made it possible for such nonsense to be listened to respectfully by the irritated general public. On the other hand, Mr. Morgan was never a cynic in his views on either political or social affairs, and always believed that in the end the outcome would be for the best. Yet instinctively that outcome was identified in his mind with methods and institutions embodying his own ideas of personal initiative and control. His remark to a conference called to discuss the Aldrich plan for a central banking institution, that he saw no reason for such an undertaking, since the banks of New York in their present relations already provided all the necessary machinery of a central bank, was absolutely characteristic of his mental attitude.

When, therefore, the question is asked again, just what has been Mr. Morgan's real and abiding influence on the financial, industrial and social history of the United States, there are some opposing and conflicting considerations to be kept in mind. I have laid the greater emphasis on those which qualify the conception of his career which most people held in 1901 and 1907, because, without taking full account of such offsetting points of view, it is impossible to gain a clear understanding of his place in the history of the times. One might easily go on to describe the necessity which existed, in the chaotic conditions prevalent in American industry and finance during the early nineties, for exactly such a powerful central personality, whose dominating will and control over other men was combined with strict integrity, great skill and experience in the field of legitimate banking, and unswerving devotion to what he regarded as the interests of his country. Only when lapse of time has permitted mature comparison of his remarkable career with that of other great figures in the domain of American finance will it be possible fully to appreciate what those qualities, exercised as they were, meant to the legitimate business interests of the country in the trying period between 1893 and 1897. As regards the later period, perhaps the history of Mr. Morgan is best summed up by saying that it embodied in itself the events and tendencies of his day. But when one reflects on the great and fundamental changes which have been going on so rapidly in American social and political affairs these past few years, that statement necessitates the further conclusion that his career, ideals and methods as then applied belong to an era that is already past.

Repudiation of a Church Name

By G. Monroe Royce

[The author of this article is rector of the Protestant Episcopal Church of St. Thomas, New Windsor-on-the-Hudson, N. Y. He is a clergyman of wide experience, both in the American Church and in the Church of England, and has written much on subjects both ecclesiastical and general. The question which he opens to our readers with so much emphasis threatens to raise a stormy issue in the meeting of the Episcopal General Convention next October, and the Church papers are already giving much space to its discussion. The East generally prefers to retain the name *Protestant,* while the West more generally wishes the name *Catholic.* The discussion is complicated with the further one of representation in the General Convention by membership instead of by dioceses.—EDITOR.]

The diocese of California of the Protestant Episcopal Church has, according to the daily press, adopted a resolution expressing a wish that the name of the Church may be changed to "The Holy Catholic Church of America." As this matter came up in the last General Convention of the Episcopal Church, and is likely to come up again in the next triennial convention, which is to meet in New York during October of this year, I think it opportune to venture a word or two on this subject in order that the public at large may understand the cause and meaning of this movement to change the name of one of the historic churches of America.

And first of all, this matter should not, I think, be mixt up with questions of churchmanship, high or low, broad or what not. Altho it appears that what is called the High Church party is more or less identified with this movement, which is to my mind a question primarily of loyalty to the Protestant Episcopal Church in the United States of America, the name that was given to this Church at its baptism, and the name by which it has been known for 125 years. It may not be a pretty name, but it is a distinctive name, and has served very well during the whole period of our national history.

Many persons, no doubt, are not altogether pleased with the sound of their own names, but most persons have the good sense and good taste not to make themselves ridiculous before their neighbors and friends by changing their names from Smith, Jones or Robinson to something more high sounding and aristocratic. People who do that kind of thing are laughed at, for they not only expose their want of humor, but they betray a vein of innate snobbishness.

Well, I fear there are such things as ecclesiastical foppery and snobbery, and this agitation to change the historic name of a great American Church seems to me a case in point. But it is more than that; and I think it should be pointed out with perfect clearness, but without intending any stigma of any kind, that the leaders of this movement appear to be for the most part alien clerics, who are Americans neither by birth nor citizenship; hence the total absence of any feeling of loyalty for the birth-name of the Church and its historic associations.

The leader of this movement on the Pacific Coast is a clergyman with English orders, who has not been a dozen years in this country, and who is still a "British subject." This gentleman is carrying on a most active, vigorous and militant "campaign for the change of name," to use his own words, and is asking the public to subscribe to his war chest. He has circularized the whole clerical body of the Church, and has succeeded, so it seems, in capturing the diocese (California) in which he is at present residing, and he has accomplished this result in spite of the opposition of the bishop of that diocese. He must therefore be an opponent worthy of respect, whatever one may think of his propaganda. The leader of this agitation on the Atlantic Coast was also a "priest" with English orders and without American citizenship. But this distinguished doctor of divinity is no longer in orders and has left the country.

The Churchman, which is the only organ of the Episcopal Church in the Eastern states, has recently changed ownership and editorship, and as recently changed from an attitude of hostility to this propaganda to one of

friendliness; and it is a somewhat curious and rather significant fact that the new editor is not an American by birth or citizenship; nor were his ecclesiastical orders conferred upon him by the American Episcopal Church. I think these facts alone are sufficient to justify me in my contention that this agitation has not a native origin and is un-American in spirit.

These men are not, of course, conscious of anything like disloyalty to this historic American Church; they are simply out of touch with the temper of the American people, which has little patience with such ecclesiastical tomfoolery.

The American people have, once for all, accorded to a certain Christian Church organization the name *Catholic,* and they have at the same time accorded to all other Christian Churches the comprehensive appellation of *Protestant,* and all King George's horses and all King George's men can't pull these two names down from the places which have been assigned them by this common consent. This may be the result of ignorance, and these agitators may know much more than the rest of us about the proper meaning of *Catholic* and *Protestant.* But illiterate as this verdict of the American people may be, it is a final judgment, and I advise these very superior persons to accept it and cease making themselves a nuisance and the Episcopal Church ridiculous.

Words may be known sometimes by the company they keep, even more than by their etymological derivation, and *Protestant* is one of these words. Moreover, this final verdict of the American people as to the popular and proper use of these two historic names, does not connote nor in the slightest degree indicate any disposition on the part of the public to take sides or show favors to any persons or parties. It simply records the fact that ninety-nine out of every hundred Americans understand the word *Catholic* to apply to one great division of the Christian world, and the word *Protestant* to include others. And therefore, for a small body, an almost insignificant body of clerics in the Episcopal Church, to disregard this universally accepted fact, and insist upon using these words in a different sense, is to cause confusion, create irritation, and hinder the good feeling which has heretofore existed as regards these matters.

I do not believe that one-tenth of the communicants and supporters of the Episcopal Church think for one moment that this popular and friendly understanding with regard to the meaning of these two words does the slightest harm or injustice to any Church or any cause.

And yet in the face of all these well-known facts, this agitation to drop the word *Protestant* and insert the word *Catholic* in the name of the Episcopal Church very nearly succeeded, at the last General Convention, and may finally succeed at the next Church Council. But how, it may be asked, can such a thing be brought about if a vast majority of Churchmen, clerical and lay, are opposed to such a change?

This undemocratic and truly astounding state of things in the Episcopal Church is explained by the fact that the voting in the convention—where all the Church laws are made—is in effect by dioceses, and not by communicants of the Church.

For example, the diocese of California, which has just instructed its delegates to the General Convention to vote for the change of name, has a clerical roll of only 93, and its communicants, clerical and lay, number 9352, whilst the diocese of New York has a clerical list of 416, and numbers 86,944 communicants. Yet the diocese of California casts as many votes in the councils of the Church as the diocese of New York.

Or if representation were based upon taxation, the diocese of New York would have more votes than a dozen dioceses west of the Alleghany Mountains. For the diocese of New York gives more money to the general cause of Church work than a dozen such dioceses as California. This is enough to show that a change of name may take place in the face of an overwhelming majority against it. I think it would actually be found that even in such dioceses as California the delegates do not fairly represent the will of the majority, and that if this question were put directly to a popular vote, not a single diocese would support this movement. I believe, there-

fore, that a victory for this propaganda in the General Convention, as now constituted, would be the most undemocratic thing that has ever occurred in this country. It would indeed be grossly unfair from every point of view, so grossly, in fact, as to outrage the feelings of loyalty and decency of a very large body of the communicants and supporters of this Church; and I further believe that many of them would flatly refuse to accept such action as binding and would hold on to the name that was given their Church at its baptism, which took place at the very beginning of our national life.

I don't say this as a threat, but as a fair warning. Let these hypercritical, fidgety clerics remember, or let some one who knows the history of the Protestant Episcopal Church tell them, of the schism that rent this Church asunder in 1873 over questions that never should have been urged. It is really difficult to speak with patience of such a partisan agitation at the very time when the Episcopal Church is asking the whole Christian world, Catholic and Protestant, to cast aside their differences, and unite as one brotherhood in presenting the message of the crucified Christ to all mankind. At such a time can Christian ministers or priests—whichever they prefer—find nothing better to do than to throw this apple of discord into the councils of their Church?

And now a final word. I have called this agitation un-American, and have referred to some of the leaders with great plainness of speech. But I think the circumstances have justified my language. Still I should be troubled in my mind if what I have said should pain any one, or should be taken as reflecting in any way upon the large body of my brethren who have come to us from the great Mother Church of England, under whose standard I served for six happy years. These ministers of Christ have brought many blessings with them. They have enriched our Church service in many ways, and have set us all high examples of order and industry which were much needed and for which we should be grateful. Take them man for man, they are the equal in every way of the native clergy and we bid them hearty welcome. There are, however, a few things which none but native Americans are able, in the very nature of things, fully to understand and rightly to appreciate. And one of these things is the national temper; and this temper will not stand for ecclesiastical hair-splitting or fooling of any kind; and the Church that makes most of these trivial matters will be made least of by the American people.

New Windsor-on-the-Hudson, N. Y.

Springtime in England

By J. E. Mills

A blackbird greeted me today,
On swiftly moving wing;
And as it passed it seemed to say,
I'm glad because it's spring.
Near where I stood a linnet sang,
Hid in a hawthorn bush;
And overhead midst apple bloom,
I heard the speckled thrush.
Borne on the breeze cuck-coo, cuck-coo,
Comes to my listening ear;
Thou vagrant bird of alien ways,
Thy cry assures, the spring is here.
A brook that ran thru meadows green,
Sang its song to me,
It filled my heart with purest joy,
With sweet tranquillity.

Primrose, cowslip, buttercup,
In field and lane abound,
And in sequestered paths and nooks,
The fragrant violet's found.
The gardens all are glorified,
Dressed in living green;
Tulip, crocus, hyacinth,
In every garden seen.
The alder and the common gorse,
The daisy prim and neat,
A thousand other plants and trees;
'Tis paradise complete.
A joy supreme is England's spring;
The land with flowers crowned,
Home of my youth, I love thee well;
To me 'tis hallowed ground.

Stratford-on-Avon, England.

The Control of Waterways

Well-Tried Methods, Intelligently and Thoroly Applied, Would Lessen Flood Loss and Enrich the Nation

By Francis G. Newlands

[Senator Newlands, of Nevada, is chairman of the Senate Committee on Interstate Commerce. He is a recognized authority on the handling of water resources and has been a leader in the development of the arid lands by irrigation. In a time of public calamity it is essential to keep the broad problem of waterways control free from the confusion resulting from hasty and incomplete schemes. Senator Newlands offers no panacea, but a comprehensive program.—EDITOR.]

In times of great disaster it is natural that men's minds should turn, as soon as everything possible has been done to save life and alleviate suffering, to the means of preventing a recurrence of similar catastrophes. We are now facing a crisis which will put to the sharpest test our capacity for efficiency in dealing with things vital to the safety and happiness of our people. Will the interest that has been aroused in means of flood prevention be as lasting and well directed as the response to appeals for help has been prompt and generous?

Unfortunately, we have not yet a settled policy for the conservation of our natural resources, and the problems of river regulation and flood control are obscured by clouds of controversy. Instead of doing things, we are at each other's throats on the question whether anything whatever can be, or shall be, done. As a believer in true conservation and one of the proponents of the policy of broadening our river improvement work to include other intimately related forms of conservation, I regret to observe an apparent disposition to take advantage of this opportunity to discredit those who favor such a policy. If there is ever a time when controversy is desirable, this is certainly not such a time. Disasters ought to bring men together, not to separate them; and I feel sure we are all seeking the same ends, even tho by somewhat diverse means—the prevention of loss by flood, the promotion and maintenance of the navigability of our rivers, and the preservation and use of our resources for the best advantage of all.

A casual reading of several influential papers for the past few days might not unreasonably lead the reader to understand that the advocates of the broadening of the river improvement and flood control policy imagine that all the rain falling from the clouds, over the entire country, can be impounded in dams and prevented from reaching the rivers. Certain statements of government engineers and others as to the rate of river flow during high water and the size of the reservoirs needed to restrain all the water precipitated during a season of rainfall have been widely heralded as proof that nothing whatever can be done.

All this is very interesting, but quite beside the mark, because nothing of the kind has ever been proposed, so far as I am aware. That such ideas should be attributed to them is not very complimentary to the eminent scientists who are advocating water storage in the interest of river regulation and flood prevention, to the level-headed business men and skilled engineers who are preparing to initiate well planned works to this end, or to the hundreds of business men chambers of commerce, boards of trade and organizations of local and national scope which have endorsed my proposal for a comprehensive study of the problem and the preparation of adequate plans. It may be possible that if all the houses hereafter built in the country are provided with hulls, masts, rudders and other means of enabling them to float with the tide, great loss might at some time and place be saved. Nobody has yet suggested such a hare-brained idea, but it appears that some debris requires to be cleared from men's minds, just as the sufferers in Ohio and Indiana must clear away a deposit of mud, before constructive work can be done.

The statement of Mr. M. O. Leighton, chief hydrographer of the Geological

Survey, which appeared a few days ago, set the whole matter in a clear light. It is not against such epochal floods that the proposed enlargement of the river regulation policy is expected to bring immunity, altho it is believed that it would in a measure reduce their destructiveness; but rather against the average flood—such as occurs in 99 years out of 100—the cumulated losses from which are probably greater than even from such phenomenal floods as the recent one. In this proposed program, the storage of water in reservoirs is only one of several means. The opponents of this policy appear to hope, by substituting a part for the whole and by attributing to its advocates ideas which never entered their minds, to discredit it in men's minds. One public man has even gone so far as to say: "Reservoirs and dams would have served no good purpose. The fact is, the bursting of reservoirs added to the total of damage to life and property."

Now, aside from the fact, just pointed out, that such statements are based upon an entire misapprehension of our purposes, the truth appears to be that the disasters in Ohio were aggravated by the giving way of a number of ancient dams, some of them dating back to the year 1840, which were known to be unsafe, and which Ohio governors and boards of public works have for years been vainly trying to have reconstructed. Moreover, I ask, is it fair to cite the giving way of such structures as an argument against the construction of safe modern works? Does any sensible man believe that if these dams had been recently built by government engineers they would have failed? And I must confess that I do not understand by what logic it is argued that, because a dam which breaks is a source of danger, a dam which does not break is not a source of safety and benefit. Let us have a little common sense, even in a time of crisis, and admit that tho dams which break help to create floods, yet dams which do not break help to prevent them.

It is to be borne in mind that the functions of a dam constructed for the purpose of aiding river regulation and flood prevention are exactly opposite to those of a dam constructed for the purpose of impounding water for domestic use. In the latter case, the object is to keep the reservoir as full as possible all the time; while in the former case, the object is to keep it as nearly empty as circumstances will permit. The object is to hold back the flood water and check the run-off, temporarily; and then, when the danger is past, to let the water escape for the increase of the flow of the river and in order that the storage capacity of the reservoir may be available when the next rainfall comes.

For years river navigation has been slowly dying and, on many streams where it once flourished, is now extinct. Along with this decay the character of the rivers themselves has been slowly changing, the fluctuations between high and low water growing greater, the floods rising higher and becoming more and more destructive. Statistics show that there has been a steady increase, ever since the country's settlement by white men, in the hight of the flood at New Orleans, at Memphis, at Cairo, and at every place where a record has been kept. This notwithstanding the fact that enormous sums have been spent in deepening and widening channels and in leveeing and revetting banks. Every year the sums demanded for this kind of work grow greater and more insistent, and every year the situation grows worse. Meanwhile the apportionment of the appropriations for the work has been made by Congress, with the result that it has become the prize of scandalous political scrambles, and that the work has been done in a haphazard, unconnected, unscientific and wasteful manner. It is no wonder that thoughtful men have long realized that something is wrong and have been trying to find a remedy.

Floods and low water, with their attending loss of life and property, caving river banks and shifting channels, soil erosion, sandbars, and other impediments to navigation, are all due to one cause, namely, the too rapid run-off of rain. What is needed in the rivers is not alternating extremes of high and low water, but steadiness and stability of flow; and what is needed on the land to prevent soil erosion and other destruction by floods, is precisely the thing which will make the flow of rivers stable; that is to say, the obstruction of run-off. If the

water which falls from the clouds is impeded by any means, it is that much longer in reaching the river (according to the nature of the impediment); but according to the inadequacy of the obstructions, it rushes so much the more swiftly and destructively into the tributaries and thence into the rivers. The means which prevent too rapid run-off are the same means which aid navigation, prevent floods and turn water into a blessing instead of a curse.

The means of preventing too rapid run-off proposed by the advocates of the enlargement of our river regulation policy are several in number, and are all such as experience has shown to be helpful to that end, as well as beneficial in themselves. If adopted, they will bring to the support of those who wish to improve the rivers and check the floods the aid of those who are interested in the conservation of our natural resources in timber and water, and in the preservation of the fertility of the soil and prevention of drought as well as the promotion of reclamation and homebuilding in the West. If the advocates of river improvement have hitherto been given scant consideration by Congress, there will be a different story to tell when they are reinforced by those interested in these other forms of conservation. In short, we propose to make this the demand of a united nation, instead of only a fraction.

First among the means of obstructing run-off is the preservation of our forests, where they still exist, and of replanting them, so far as possible, where they have been destroyed. It is hardly possible to take very seriously the gentlemen who argue that forests do not impede run-off. The experience of other nations, no less than our own, proves that they do. Every man who has lived in a wooded country knows by his own observation how the dead leaves, branches and undergrowth hold the water in check, causing it to soak into the soil and forming a spongy blanket over the earth, from which the water oozes slowly into the rills. It is true that our finest forests have been destroyed to make homes for men, and that the area left available for replanting might not exert a controlling influence on the floods, even if all taken advantage of. It is the steady expansion of our planted and cultivated home area that is largely responsible for the growing floods, because the removal of forests and the cultivation of the soil in careless and unscientific methods both tend to facilitate rapid run-off and increase floods. Thus the expansion of our country has itself been an agency of destruction. We cannot retrace our steps, and no true conservationist wishes to do so; but much can be done by planting trees wherever possible and by teaching scientific soil cultivation for the prevention of run-off. Here, then, the believer in the conservation of timber and soil has a common interest with the advocate of river regulation and flood prevention, and they should work hand in hand.

A second means of obstructing run-off is found in the proposed construction of dams for the formation of large reservoirs, at selected sites on the headwaters of streams. Stripped of the misunderstandings which surround it, this means simply that it is believed enough water can be impounded to exercise a considerable restraining influence upon floods, and at the same time to promote navigation by letting out the stored water to reinforce the flow at times of drought. The storage of large bodies of water in this manner for the regulation of the water supply of canals and rivers is no experiment, but a well-known and approved method of engineering work. It is practised at many places in France and other countries, and in this country has been in use for at least seventy-five years, in Ohio, on the Miami and Erie Canal, the Ohio and Erie Canal, and elsewhere. Since the impounding of water in this manner would create vast water-power, it is proposed that the cost of the works can be repaid, in part at least, by selling the water-power.

No reservoir system for the purpose proposed has yet been completed in this country. The only instance in operation is that on the headwaters of the Mississippi designed to control about 11 per cent of the drainage area above St. Paul. The original project contemplated the construction of a system of forty-one reservoirs, of which five are now in operation. The results reported by the engineers from the operation of the dams in use give great encouragement for the

belief that the system, when completed, will be entirely successful. The stage of water at St. Paul during the dry season has been increased, by this means, an average maximum of eighteen inches. During the unprecedented dry weather of 1910, when the rainfall in Minnesota was less than half the normal, these reservoirs supplied more than two feet of water at St. Paul; and during the summer of 1911 they were equally effective.

The most conspicuous project of this kind at present is with reference to the Alleghany and Monongahela rivers, which, coming together at Pittsburgh to form the Ohio River, are often both in flood at the same time and cause great loss at Pittsburgh, as well as at points farther down the Ohio River. The enterprising men of Pittsburgh, weary of their large annual losses, raised a fund and expended it in a scientific study of the means of flood control. Their engineers found certain favorably situated spots, now known as the "seventeen selected sites," where, by the construction of storage dams, they believe enough flood water can be impounded to reduce the crest of the flood below the line of danger. I will have to leave the controversy over the correctness of their conclusions to others. It would seem, however, that there would be little difficulty or expense involved in putting the matter to a thoro test. I am fully of the opinion, however, that if the people of Pittsburgh and other places along the Ohio River can be protected by such means, we have no right to refuse them this protection. They are just as much entitled to it as the dwellers along the lower Mississippi are entitled to have levees built for their protection. And what is true of Pittsburgh and the Ohio River is also true of the Miami, the Scioto, and any other stream where similar conditions may be found. If reservoirs create floods when they break, then they will prevent floods when they hold fast. Let us build the kind that do not break.

A third means to the same end is the deepening, widening and straightening of river channels, the building of levees and the laying of revetments along the banks. These are the methods now and heretofore pursued, and there is no dispute about their propriety, always provided the work is done in a comprehensive way and under large plans, taking each river system as a whole into consideration from source to mouth, and removing the apportionment of the appropriations from political control. Some of the present beneficiaries of this work, however, object to the enlargement of its scope to include other means of river regulation and flood prevention, contending that these things are all that can be done or ought to be done. The advocates of an enlarged policy reply this work is but a fragment of what we shall be ultimately forced to do, if we are ever to accomplish the aims of true conservation; that it would be an economy of cost and effort and a saving of time to take the work up in its larger aspects now; and they greatly deplore what seems to them the shortsightedness and selfishness in the attitude of the advocates of a levees-only policy.

A fourth means of river regulation and flood prevention, and perhaps the most important one, is by the prevention of soil erosion and storage of water in the soil itself. It may be that the advocates of an enlarged policy have not taken sufficient pains to explain how these things are related to each other. If so, it is high time it were generally understood, if we are to get anywhere with the conservation movement.

When water falls from the clouds, in the form of rain, upon the ground, it either runs off or is absorbed into it. To the extent to which it is absorbed, it moistens the ground and is held by it for a longer or shorter time; and to the extent to which it runs off, it carries away with it part of the soil itself into the stream. This is called soil erosion. As a matter of fact, both these effects follow in varying degrees, depending upon such elements as the quantity of the rainfall, the condition of the soil, the slope of the surface, and the obstructions to run-off which may exist. Cultivation, as now ordinarily practised, affords the most favorable conditions for rapid run-off and comparatively slight absorption. A natural result of this is that not enough moisture is stored in the soil, and when a period of drought comes during the growing season of the crop there is a failure for lack of moisture. Does it

really seem reasonable that, in regions where the annual rainfall is from 25 to 40 inches, crops should often be ruined because rain does not fall at the right time?

If the absorption and retention of moisture in the soil of cultivated land could be increased, the following results may be confidently expected to follow: Soil loss by leaching and erosion would be greatly reduced, run-off would be diminished; floods would be checked, failure of crops by drought would be abolished, and navigation would be facilitated. The soil itself would become the greatest of all storage reservoirs, one of unimaginable extent and capacity; and at the same time the very use to which it was put would increase its fertility and value.

The means by which this is accomplished is, briefly, to plow the surface of the soil in such a way as to hold back as much as possible of the rainfall and to cause it to sink into the ground instead of running off. Where this is practised the plowing is done in narrow "lands," so that there are alternate furrows and ridges. If the field is sloping or hilly, the plow follows the contour of the level land. Thus the water is collected in level furrows and between them the ridges stand guard. This method of plowing forms no obstacle to the planting and cultivation of the crops. Long experimenting has demonstrated its effectiveness in increasing absorption and preventing run-off. An inestimable benefit was conferred upon the cotton planters of the South by the late Dr. W. J. McGee, in his suggestion of this method for preparing their fields. Mr. Freeman Thorp, the portrait painter, has for years pursued this method upon his farm in Minnesota and demonstrated that it not only forms an absolute insurance against loss by drought, but also doubles the productiveness of the soil. He has also found that whereas the average time required to bring a crop of timber to maturity is forty years, a better crop can be matured in seventeen years by this method. Again, in the semi-arid West a method of soil cultivation has been developed known as "dry farming," by which crops are now profitably grown over large areas where formerly nothing could be raised because of insufficient rainfall. The population and wealth of this region have been enormously increased by this discovery of a method of storing rainfall in the soil. It is no uncommon thing, in that region, for a farmer to save the rainfall of two years and utilize it for growing one crop. The methods used for storing the water in this soil for "dry farming" are not applicable to the humid regions, but these facts are cited to show that it can be done and that it is no new thing. Where irrigation is practised, a method of conserving the moisture is used which is precisely analogous to that which I have attempted to describe.

There is no good reason why such methods, perhaps somewhat changed to meet the different conditions, cannot be adopted in the entire farming area of the United States, wherever there is soil erosion, leaching out of salts, drought, or floods. And this not upon the cultivated fields, alone, but also and more especially upon the meadows, pastures, wood lots and waste lands. It has been estimated that these classes of lands form fully half the area of the State of Ohio, and if these methods were adopted, this fact would greatly enhance the benefits derived. There is a limit to the volume of water which can properly be absorbed by cultivated lands, and in many places drainage would have to be provided; but with the classes of land above mentioned there is practically no limit to the moisture that can be profitably absorbed. Every one who has observed how trees grow on river bottom lands will readily understand how the absorption of all the rain falling upon soil covered by forests might be beneficial to the trees, even in a humid climate. The production of grass for hay and grazing would also be greatly stimulated.

I wish to make it very clear that this last suggestion is not a proposal for a raid upon the treasury. It is something which the farmers can and ought to do for themselves. All the Government need do is to provide the means of their education and for the demonstration of proper methods. Once shown that it is profitable, self-interest would lead them to do it. The soil experts of the Department of Agriculture have known these things for years; only lack of funds has prevented their spreading the light.

A fifth means is the storage of water in the arid and semi-arid regions, and its utilization for irrigation where rainfall is not sufficient. Little need be said about the importance of irrigation in the West or of the need of providing homes for our people on the soil. Where irrigation is being practised it has been found to aid in the prevention of floods, and there is great need for the extension of the work for this reason, as well as for other reasons. By combining the uses of river regulation and of irrigation, where one dam will serve them both, the cost can be shared and larger benefits conferred. There are many places on the headwaters of the western tributaries of the Mississippi where this can be done, to say nothing of the Pacific Coast, where the people are as much interested in the promotion of navigation and prevention of floods as in the Mississippi Valley.

The cost of the works proposed would be large, beyond doubt. It is easy to shock people, by the startling presentation of large figures, into the belief that such proposals are impracticable. The nation is spending more than a billion dollars annually upon its running expenses. Nobody proposes to spend as much as that upon these forms of conservation in any one year, or in two, three or five; but if the investment of half of such a sum within a period of ten years would give us navigable rivers, prevent ordinary floods and mitigate extraordinary ones, stop soil erosion, increase our disappearing timber supply, prevent crop failure by drought, increase the productivity of the soil over all the humid region, and make thousands of new homes for men in the arid and semi-arid West, then I am for spending it.

Such in brief outline are some of the means which could be, and I believe ought to be, adopted in the solution of these great problems. My proposal is simply that a competent body be organized to study the questions involved and formulate plans for the coördinated benefit of all the interests involved, along these general lines; and that then ample funds shall be provided for carrying out the plans in the most substantial and scientific manner. The legislative machinery can be easily organized if Congress can be induced to heed the popular demand that it shall be done. Just now, while the public interest is aroused, is a good time to settle whatever differences we have and to come together in well considered plans for the common good.

Washington, D. C.

The Mosque at Ephesus

By George E. Woodberry

A gray shell with a ruined tower
  Whereon the wild stork sees
On the moor's arch with wind-sown flower—
  Within, the aged trees!
Tranquil decay, and silence meet
  To strew round old belief!
While every mellowing stone grows sweet
  With time's unconscious grief.

Once as on Salisbury's moor I lay
  Where the great stones remain,
I felt my very soul grow gray
  And sink into the plain;
A solitary lark clomb up
  In the dark, sunset sky,
And singing filled from heaven the cup
  I drink of till I die.

Now world-wide grows the music rare
  I harbor in my mind;
I hear the lark's song everywhere
  That I the gray stone find;
It rises in my heart of hearts
  And music floods my brain—
Old Mosque, o'er thee it fluttering starts,
  And soars, and comes again.

Ye antique trees, grow fresh and green
  Within the roofless nave!
The song that hangs in heaven unseen
  Shall rest upon my grave;
And when it rises from my breast,
  Yon arch shall break to flower,
And the wild stork shall cap his nest
  White on the mouldering tower.

Beverly, Mass.

The Opium War in China

By Dr. W. A. P. Martin

[We have just received from Peking the following letter telling of the courageous efforts of the infant republic to suppress the vice that has so long been the curse of the country. The task would be hard enough if the Chinese Government had only its own people to deal with, but unfortunately outside influences of the strongest kind are also being exerted to check the reform movement. More recent advices from London tend to confirm the report that the British Government proposes to compel China to pay for the immense stock of opium raised in India and now stored in the treaty ports because of the refusal of the Chinese Government to admit it to the country. This is as preposterous as tho the State of Missouri should compel the State of Kansas to pay for all the beer which St. Louis breweries might sell in Kansas if it were not for the prohibitory law. Let us hope that the recognition of the Chinese republic by the United States, so long belated, will come in time to strengthen the hands of the Chinese Government. Dr. Martin is the oldest of the foreign missionaries in China and long the president of the Imperial University of Peking.—EDITOR.]

The fight with opium, which began four score years ago, has of late been taken up with fresh vigor by the Republic.

In most of the provinces troops are sent to root up the newly planted poppy fields. The farmers, where able to do so, do not hesitate to offer resistance. In Fukien they made some headway and hoisted the standard of rebellion. Telegrams of this morning report that the Government forces are gaining ground. If the Republic is not subjected to pressure *ab extra* there is good reason to hope that it will meet with success in other provinces, and eventually rid the Chinese people of this incubus.

Seven of the eighteen are declared free from poppy, and the foreign drug is rigidly excluded. To others it still makes its way in bulk, but the authorities feel that a wholesale trade of such a character threatens ruin to both state and people.

On March 6 I was invited to read a paper before the Peking Oriental Society, and I took for my theme the life of Commissioner Lin, whose high-handed measures in compelling the surrender of 22,283 chests of Indian opium in 1839 brought on the so called Opium War.

The war was not waged to compel China to admit the drug, but to avenge insult and punish violence. In this view John Quincy Adams agreed with Lord John Russell. The treaty of Nanking and subsequently other treaties were made in terms of equality. Five ports were opened to trade and a great step made toward the opening of the whole empire to commerce and missions.

Lin's mistake was the assertion of his master's supremacy. Witness his letter to Queen Victoria, in the form of a mandate and treating her as a vassal. His errors were those of ignorance, but he was laborious and honest. After sending him into exile for his failure to keep opium out of China, his master recalled him and charged him with a more difficult commission—that of suppressing the fanatical Taipings of Kuengsi. When Lin, worn out by forty years of public service, was on his way to the south, the Angel of Death met him at Swatow. He was canonized as "the learned and loyal."

I exhibited two volumes received from his grandson, one being an autobiography, the other a book of poems, the combined production of Lin and the Viceroy Teng.

No wonder the efforts now made for the suppression of a degrading vice have brought Lin's name into fresh prominence!

The *Peking Daily News* of this morning reports that the British Legation proposes that the Republic shall pay for the accumulated drug, and make the sale of it a government monopoly. The governors of several provinces, hearing of this proposal, promptly sent up an energetic protest.

No force will be employed to support the opium trade, we are told by members of the British Cabinet. Will an empire which made such noble sacrifices to effect the suppression of negro slavery tolerate any attempt to rivet on the Chinese a vice which they are struggling to shake off? God forbid!

Peking, March 8, 1913.

An Inventory of Information

How a Philadelphia School Discovers the Length and Breadth of Its Pupils' Knowledge

By Stanley R. Yarnall

[The general information examination paper published in our issue of January 2 interested many of our readers and some, taking literally our rhetorical question, "Can You Answer These Questions?" sent us in their answers for us to grade, which was more than we bargained for. Principal Yarnall, of the Friends' School, Germantown, Philadelphia, sends us the examination used in his school this year and makes some interesting observations upon the results.—EDITOR.]

The general information test has become an annual institution of our school. Following the good example of a Philadelphia neighbor some nine years ago, we gave our first test as a surprise on one of those unsettled, uncomfortable days at the close of a Christmas recess. The experiment was so interesting and stimulating that it has been repeated regularly until teachers and pupils have formed the habit and look forward to the unannounced day of testing as an event of no little importance in the school year.

The effect of the test is to give a wholesome respect for useful and interesting information, to quicken the desire to know, to understand, and to have one's intellectual wares available, to arouse a noble discontent and to cultivate humility.

Evidently a great deal depends on the questions. The paper is prepared by a committee of the teachers, and is discussed at a faculty meeting, when alternative answers that may be accepted, uniform methods of grading, and other details are determined. The aim is not to set a paper that is limited to work covered by the school studies, but to make it broadly representative of what a boy or girl, man or woman, should know to be able to share the manifold practical and intellectual interests of mankind with pleasure and intelligence. It is on such a broad definition of "general information" that the emphasis is placed.

The test for 1913 which follows was too long. One hundred questions should be the limit. The questions are grouped for variety, interest and because of natural classification. Groups V, VI and VII are especially calculated to test one's working capital in the meaning and values of words, and in the application of practical ingenuity and common sense.*

GENERAL INFORMATION TEST.
FRIENDS' SCHOOL
Germantown, Philadelphia
Second Month 28, 1913

I.

Name:

1 The President of the United States.
2 The President-elect of the United States.
3 Two United States Senators.
4 The Governor of your State.
5 The Governor of California.
6 The Mayor of your city.
7 Two college presidents, choosing from the presidents of Columbia, Cornell, Harvard, Haverford, Leland Stanford, Jr., Pennsylvania, Princeton, Yale.
8 The country just granted home-rule.
9 An American possession desiring home-rule.
10 The athletic sports held in Stockholm, 1912.
11 The late founder of the Salvation Army.
12 Two Balkan States.
13 The two greatest manufacturing concerns in your neighborhood. What do they produce?
14 Four prominent colleges for women.
15 The chief subjects essential to college entrance.

II.

16 Name a planet having rings, and one having moons.
17 How often do we see the unfamiliar side of our moon?
18 Give the date of one equinox.
19 Into what waters does the Panama Canal open at its eastern terminus?
20 Who invented the Fahrenheit thermometer?
21 Is coal organic, or inorganic?
22 Give in order the colors of the rainbow.
23 How many inches in a meter?
24 How many feet in a mile?
25 Where is the whalebone in a whale?
26 Bound your State.
27 What is the treatment for fainting?
28 How may a rescuer protect himself from smoke in a burning building?

*A few of the questions have been cut out as referring to local affairs or to lectures recently given before the school.—EDITOR.

29 What are the Board of Health regulations in regard to measles?
30 What time is it at San Francisco when it is noon at Washington, D. C.?
31 What is the best color for the walls of a school-room? For the walls of a hospital?
32 What makes a dollar bill valuable?
33 State three ways in which pupils commonly injure their eyesight.

III.

Mention some fact (recent, when possible) about

34, Achilles; 35, Amundsen; 36, Baden-Powell; 37, Luther Burbank; 38, the Hay-Pauncefote Treaty; 39, Lloyd-George; 40, Shem, Ham and Japhet; 41, Captain Scott; 42, Colonel Goethals; 43, Lawrence, Mass.; 44, Kansas, Oregon, Arizona; 45, Murillo; 46, Poincaré; 47, Whitelaw Reid; 48, the Rubicon; 49, Sir Joshua Reynolds; 50, Wagner; 51, Pujo.

IV.

Locate:

52, two American institutions for educating Indians or colored people; 53, Mesopotamia; 54, Andorra; 55, Corsica; 56, the Victoria Falls; 57, the Iberian Peninsula; 58, Melbourne; 59, Mt. Copernicus; 60, Jericho; 61, Sparta; 62, Antwerp; 63, Adrianople; 64, Gulf of Aden.

V.

Explain:

65, Running the gauntlet; 66, the sick man of Europe; 67, stealing my thunder; 68, that cooked his goose; 69, red-tape; 70, star chamber methods; 71, raison d'être; 72, an axe to grind; 73, begging the question.

VI.

Distinguish between:

74, Martyrdom, suicide, assassination; 75, precede, proceed and proceeds (noun); 76, dredge and excavate; 77, hydraulic, pneumatic; 78, metropolitan, cosmopolitan; 79, counterfeit, imitation; 80, allusion, illusion.

VII.

81 How large an investment at 5 per cent will produce a weekly income of 50 cents?
82 State two advantages of the newly-added post office service.
83 What is the new amendment to the United States Constitution?
84 Name the latest State admitted to the Union.
85 Multiply 1/12 by .144 and divide by 1/4. Express both as a fraction and as a decimal.
86 Find the cubical contents of a room 20 feet long, 18 feet wide, 8 feet high, having the usual doors and windows.
87 Mention the greatest ocean disaster of 1912.
88 Imagine the hands of a clock at eight minutes past eight. What time would the clock show if the position of hour and minute hands were interchanged?
89 Draw a square. Consider it a map of a square mile with north at the top. Now draw within this square another around the southeast quarter of the southwest quarter of the northeast quarter.
90 Solve the following easy cypher. The consonants are odd numbers, or else as given: G614—34—L65479Y—87—G614—34—D429H.

VIII.

Identify the following by author, or work, or further quotation:

91 "A man's a man for a' that."
92 "Here will he see
No enemy
But winter and rough weather."
93 "Ring out the old, ring in the new."
94 "I come to bury Cæsar, not to praise him."
95 "The sun shall not smite thee by day, nor the moon by night."
96 "Humanity with all its fears,
With all the hopes of future years,
Is hanging breathless on thy fate!"
97 "A soft answer turneth away wrath."
98 "Full many a flower is born to blush unseen,
And waste its sweetness on the desert air."
99 "A thousand thousand slimy things
Lived on; and so did I."
100 "He has paid dear, very dear, for his whistle."

IX.

Who wrote:

101, The Acts of the Apostles?; 102, "King Lear"?; 103, "Poor Richard's Almanac"?; 104, "Pickwick Papers"?; 105, "The Marble Faun"?; 106, "Faust"?; 107, "Water Babies"?; 108, "Marmion"?; 109, "The Odyssey"?; 110, "The Æneid" of Virgil?; 111, "Les Miserables"?; 112, "Up from Slavery"?

X.

Name the language in which each of the following is written, and give the meanings, when you can:

113 Mann wæs fram Gode asend, thæs nama wæs Iohannes.
114 Πάτερ ἡμῶν ὁ ἐν τοῖς οὐρανοῖς.
115 Le jour de gloire est arrivé!
116 Sic transit gloria mundi.
117 Lasciate ogni speranza, voi ch' entrate.
118 Wel coude he singe and pleyen on a rote.
119 Ein' feste Burg ist unser Gott.

The Germantown Friends' School is coëducational. The test is prepared primarily for the pupils of the high school department, covering five years from the senior to the fourth class, inclusive. However, the intermediate pupils, those of the fifth, sixth and seventh classes, are always eager to try the examination. The classes represented cover the years of the usual public grammar and high schools. The pupils of the seventh class

average about ten years of age, and those of the senior class about eighteen. It will be seen that the nature of the school makes possible an interesting comparison between boys and girls and between classes differing in age. The papers were carefully marked and were graded on a scale of 100. The tabulated results of the test given February 28, 1913, are as follows:

Class.	Boys.	Girls.	Class average.
Senior	51.8	66.7	60.4
First	62.3	44.9	49.4
Second	53.6	50.6	52.
Third	62.8	35.67	38.68
Fourth	54.55	29.47	37.08
Fifth	26.46	22.86	24.01
Sixth	27.8	18.02	21.7
Seventh	23.16	18.6	20.6

The results are interesting in that the boys lead the girls thruout excepting in the senior class, which this year contains an unusually able group of girls and a few boys who brought down the average. The greatest advantage of boys over girls is shown in the third, fourth and sixth classes. It is further interesting to notice that, with the exception of the first class, there is a direct gradation from the 60.4 per cent of the senior class down to the 20.6 per cent of the seventh class. The poor showing made by some of the girls of the first class has brought down the class average below its normal position. The boys of the senior, second and fifth classes seem also to be lower than they should be.

The results year by year show that boys may be expected to lead girls in general information by a considerable margin. They also show that the interest of girls in current events and matters of general information does not develop so early and increase so regularly as is the case with boys. It will be noted that the averages for the girls run low thru the third class, when their age is about fifteen, and rise when the work of the high school course becomes strenuous. Readers may draw their own inferences from these records. It seems to an impartial judge that girls awaken much later than boys to a wide interest in affairs, and that this awakened interest is largely due to the stimulation of a course of study that becomes more broadening and at the same time more exacting as it advances.

The element of humor is not lacking in the answer books. Some answers that relieved the labors of the examiners are as follows:

Begging the question,—Proposing.
That cooked his goose,—That made him mind.
Hydraulic,—It has hydrogen in it.
Pneumatic,—It has pneumonia in it. Another definition was—"Subject to pneumonia."
One way of injuring the eyesight is "to look cross-eyed at other pupils."
Metropolitan,—An opera house.
Cosmopolitan,—A magazine.
The colors of the rainbow are pink, lavendar, green and blue.
Lloyd-George was rescued from the "Titanic" disaster.
The "Æneid of Virgil" was written by Homer, Horace, Æneas.
Pujo,—A place where the Mexicans are fighting.
"Well coude he singe and pleyen on a rote" is in Pennsylvania Dutch.
Raison d'être,—A raisin cake, a delicatessen.
To the question, "What makes a dollar bill valuable?" one pupil answered: "The hair in it"; another, "When you have spent the rest of your allowance."

Some further interesting deductions may be made from the individual averages. The highest grade in the high school was a score of 88 per cent, made by a girl of the second class, and the highest intermediate grade was 47.2 per cent, made by a boy of the fifth class. To a degree unusual, even in private schools, the families of the pupils are known to the principal, and he is able to tell pretty accurately the intellectual atmosphere of the home. Without exception, the twenty pupils who lead the high school list are from homes where intellectual stimulus is found, and where the parent or parents share in the interests of their boys and girls and keep closely in touch with their school life.

On the other hand, one may confidently look at the end of the class lists to find the names of pupils whose homes fail to supply these helpful influences. There are few surprises or exceptions. An earnest boy or girl from a home of low culture and weak character may stand well in regular school work, but the ample foundation, the broad outlook, the firm grasp, are lacking.

The analysis seems to prove that while the school may do much, the general information of a pupil depends finally

upon his home, and on the direct influence of his parents or older relatives. The talk at table, the generous open spirit, the nature and variety of the interests of the different members of the family, the disposition to share experiences with boys and girls and to draw them out and into the activities proper to their all-round development: these are vital factors in the lives of the young. In this age of shifting the burden from the home to the school, these are duties and privileges that cannot be withdrawn from the home without making it a place where only a second-rate crop of children can develop.

One great advantage of the general information test is the interest it creates in the home. Everybody tries to answer the questions and asks his friends of every age and condition about the obscure or doubtful points. Pupils and their elders find common interests as they discuss the paper. Best of all, they discover in a practical way that education and life are one and the same, and that each must complement the other, with home and school working in unison. Schools trying the experiment will find that no other agency will so effectively bring together the parent, the teacher and the pupil on a common ground free from self-consciousness.

Germantown, Pa.

The Envious Envied

By Mella Russell McCallum

They come down thru our alley every day,
A'looking like their mothers didn't care.
Their blouses are so dirty and their legs,
Below their trouser-knees, are brown and bare.

But they're going to the docks to dive and swim,
Where the water's deep and dangerous and dark,
And you don't have to wear a suit at all,
And there isn't any danger-rope to mark.

'Course Madge and Bob and I go swimming, too;
My father puts us in the tonneau-seat,
And we go to the bathhouse in the park,
Where the sand is soft and warm around your feet.

It's safe there, and you don't hear naughty words,
And our parents read, and watch us from the lawn,
And then we all have sandwiches and cakes,
And play around until the sun's 'most gone.

And then we pack our suits in rubber bags—
(We don't rent those that other people wear)—
And climb into the car, all tired and glad,
And whiz home thru the pleasant twilight air.

I'm told that I am very fortunate—
And yet, when the dirty blouses come,
A'hollering thru our alley, I just wish
That for a while I, too, could be a bum.

For they're going to the docks to dive and swim,
Where the water's deep and dangerous and dark,
And you don't have to wear a suit at all,
And there isn't any danger-rope to mark.

Detroit, Mich.

Independent Opinions

Quotations from the Letters of Our Readers

It takes all sorts of people to make a world, and when we look thru our daily correspondence we are convinced that representatives of most of the sorts take THE INDEPENDENT and write to us about it. All this is very useful to an editor. It expands his mind. We do not mean that it tends to "give him the big head." Quite the contrary, in fact; but it serves to give him some faint idea of the wide extent of the circle for which he writes and the diversity of the minds composing it.

Here, for example, is a remarkable letter, really unique in our experience, for while it is not rare to find a contributor who seems to entertain a similar opinion of his mental powers, yet he ordinarily does not express his opinion with such frankness:

R. F. D. No. 2, ALLENDALE, N. J.

Dear Sir:—Do you think there is any chance for an unusually great and genuine thinker to get a brief and fair hearing before the world thru the medium of any suitable publication? Some people might suppose that an unusually great thinker could easily get a hearing any time, but history teaches that the opposite has always been the rule.

Is the press of this present civilization mentally and morally capable of conveying a brief and simple message of truth from a genuine thinker to the people? All other kinds of ideas are freely published, from the ravings of lunatics to the latest scientific discoveries. Is there any reason why I alone should not be heard?

All intelligent people know something about the present growing, world-wide, agitated, trust-controlled, high-priced, strike-disturbed, bomb-shaken, tangled, trying, revolutionary and uncertain human situation. Civilized people everywhere are asking for more light on the scene. But true light has already come. Any age which brings the human race face to face with a great, world-wide and perplexing problem, also furnishes a genuine thinker to find and make known the solution. Why not take full advantage of the rare opportunity which my appearing as a genuine thinker now furnishes the world for having this whole matter briefly, simply and unanswerably explained? To do so would scarcely cause me perceptible mental exertion.

I know the absolute truth. I have free access to Wisdom's fountain head. I have taken advantage of that great reality which so many others have carelessly overlooked. My mental abilities are practically unlimited. I am as much a wonder to myself as to anybody else. My coming is an event which occurs only once in many centuries of time. I stand before the whole present world in the same definite, advanced, first hand knowledge of absolute truth as the few greatest past thinkers in their respective times. I am that sure personality long predicted and expected to appear.

I have thrown down all barriers to new light; stripped the truth bare of all superstitions and errors; discovered and applied the Principle of the Universe to all life; explained the physical, mental and moral universal laws; mastered the true significance and interpretation of all Scripture and History; reduced the knowledge of the way of eternal life to a simple, practical, easily understood rule; reset the truth in modern language and ways; furnished the world with a newer and higher idea or view of truth; thereby raising the whole human mind up to a higher plane of life and laying the foundation for the greatest world-civilization ever known. . . .

It is well known how past great thinkers were despised, ignored and abused and looked upon as blasphemers, as insane, and as possessed with devils. Here is an opportunity to show how much better we are now. Have the examples and teachings of thousands of years of human history made much visible change? Why should another horrible blunder be made?

I want to write, for the widest possible publication, a series of simple, brief and respectful articles on the whole present human situation, showing the true significance of the present various social, religious and political conditions in their connection with the whole. Would not such a brief series, when coming from a thinker who really knows what he is talking about, be extremely important, timely and interesting? Is it not better to know and conform to the truth than to plunge madly into possible terrible disaster?

But supposing that after all—in full view of this letter and of all the many daily published expressions in favor of equal rights, welcoming truth, helping worthy men and of recognizing merit whenever found—I should be refused the hearing I request, would it not show an extremely suspicious state of affairs? Would it not at once proclaim me the master of the situation with

all modern scholarship hopelessly baffled and defeated? Would it not show in the most glaring way the present-day press to be only a false, hypocritical, unreasonable, money-enslaved and worthless institution after all?

I do not want any "Sorry but," or "I regret to say," letters. But kindly let me know by mail if any definite arrangement can be made.

Yours respectfully,
JOHN OSBERT HART.

We are glad to be able, by the publication of the above letter, to give its author a chance at the hearing he demands, but we hesitate to engage the series of articles he proposes, for the contrast would be too great between them and the other contents of the magazine, written as they must be by authors who are neither infallible nor omniscient.

From an American scholar who has the rare distinction of holding a professorship in a German university we have received the following interesting suggestion of a reform in our administrative machinery. Evidently the "commission idea" is in the air, since such a plan comes to us from Texas, Kansas, California, Washington and Germany almost simultaneously:

LEIPZIG.

In the number for February 13th you say that Congress is ready to amend the Constitution so far as the President's term of office is concerned. Would it not be better in every way if the executive were thoroly modernized and rid of the turmoil of a one-man election? The one-man executive for a nation is a monarchical reminiscence that is now out of date. A nation needs an executive with more than one brain. The United States should have an executive like a more permanent cabinet, consisting say of nine or eleven members dividing up among themselves the departments now given to the several secretaries and electing each year one of their number to be the chairman or business-president for the year. Three or four members should go out of office and be replaced by others or reelected every three years. This is simply a general picture of what would be possible under such conditions. It is clear that in this way the United States could have at their head a small group of select men from different parties who would command universal respect at home and abroad. There is, I think, not the least danger that a Tweed would ever reach such an official position. Any man who showed peculiar fitness for a given department could by re-election be kept in it so long as he was vigorous. The only exception to the continued office should be the yearly changing chairman or president, who would be glad to be freed from the added duties of the chair; that would not present the attractions attaching to the present seat.

It seems to me that the proper method of treating this question of the executive would be to take it out of the realm of every-day politics. A constitutional amendment that aims at modernizing the executive should not be drawn up by Congress. The Senate and House should in general committee appoint a non-congressional commission composed of not too large a number of the best men of the nation, including some of the highest legal authorities. This commission should be, comparing small things with great, a renewed Constitutional Convention in a nutshell, and should study all the bearings of such a plural executive, and prepare the necessary constitutional amendment for submission to Congress and thru Congress to the people of the States. The commission would determine the number of the executive board, the method of the election of its members and the prerogatives of their office, including their duty on occasion to appear before Congress in person to explain and justify the measures taken in any department. This commission would lend to such an amendment a weight, a conviction and an acceptance that could scarcely be secured by a committee of Congress working amid the distractions of a session. The minority reports of any members of the commission on doubtful points would form a basis for Congressional discussion.

Should any one complain that there is no precedent for this, he would but emphasize the fact that it is modern. We cannot blame our forefathers for not governing by commission. But we should be to blame if we should not now do the best thing for today. CASPAR RENÉ GREGORY.

The editorial on the Edgell case (March 20) excited much comment and brought us many letters, either warmly commendatory or hotly condemnatory. The two letters quoted below are representative. The first is from a man who holds a professorship in a large Eastern college:

Good for your strong paragraph on "Penalizing Parenthood!" I feel with you that the decision of the Board of Education is momentous. It will open up the whole question of the right of a married woman to work in the larger work, a right now for the most part denied her by our primitive patriarchal conventions and by our organization of the working world in terms of male needs and possibilities. There is no reason in the world why a married woman with children should not teach two or three hours a day—no reason

except our stupid male unwillingness to readjust teaching schedules to the needs of women. Colleges are organized on the basis of teaching schedules of two or three hours a day. There is no reason why the same thing would not be possible in the schools with such readjustment of schedules. We should secure the services of women who, because they are mothers, would be far more valuable than unmarried women. We should also cease to set before unmarried women teachers the drastic alternative of retaining their professional activities at the cost of marriage and motherhood, or marriage and motherhood at the cost of their professional activities. The alternative is a male-manufactured device and has no excuse for being.

The second letter in reply to this editorial comes from a New York lady who objects both to our criticism of the Jewish morning prayer and to our condemnation of suffraget violence:

Because of the usual broad-minded attitude of THE INDEPENDENT, I was particularly surprised to find the prejudiced and bigoted point of view shown in two editorials in the Easter number.

At the conclusion of the article on "Penalizing Parenthood," you attack an ancient phrase, which, as a matter of fact, is not literally interpreted by Jews, for nowhere is the position of the mother more sacredly cherished than in the Jewish home.

Then you paradoxically uphold in your article on "Candidates for a Hunger Strike" the inhuman treatment of women who are defending the principle for which our national heroes fought.

On the one hand you attack the Orientals for traditions which they do not live up to and on the other hand you glorify your Christian brothers for outdoing the barbarous exploits of their own savage ancestors.

If this is your interpretation of the "Christian Conception of Womanhood," I feel that your point of view is entirely too narrow to be sympathetic reading.

From Mr. Blount, whose volume on *The American Occupation of the Philippines* was criticized in our issue of March 20, we have received a letter, stating his position and correcting a mistaken allusion by our reviewer:

WASHINGTON, D. C., March 22, 1913.

The real issue I urge is, not whether the American people have any desire deliberately to keep permanently in subjection a distant and deserving people eager to be free, i. e., eager to see the leading men of their own race in charge of their common destiny—a people, by the way, whom Admiral Dewey repeatedly declared in 1898 to be "far superior in their intelligence and more capable of self-government than the people of Cuba"—but whether the 63rd Congress should, or should not, make a formal and unequivocal announcement that it is the *bona fide* present intention of this nation to give the Filipinos their independence just as soon as we are satisfied they are fit for it. My proposition is simply to exchange a balking horse for a willing one. In other words, I urge a policy of courageous frankness in lieu of the irresolute evasions of the McKinley-Taft policy of "benevolent assimilation." That policy has always been willing to *imply* a promise of ultimate independence, but afraid to *express* such a promise, formally, thru Congress, lest the special interests which believed the Philippines might ultimately be profitable to them, and therefore wished to keep them forever, should take offense. . . .

Whether "the argument [presented in my book] is singularly weak and inconclusive" or not, certainly advice and counsel to that effect will be duly discounted when it comes from a reviewer who can see nothing absurd in the assumption that one who was a lieutenant of volunteers in 1898 is the same man who five years before that had been sent to Hawaii by President Cleveland on a special confidential mission of great importance, clothed with paramount authority over the land and naval forces of the United States then stationed there. I need not here discuss the course pursued at Honolulu in 1893 by my late honored father, who died these ten years ago; nor reopen the question of how we got Hawaii; nor waste time debating whether or not the American Minister to a friendly foreign government may properly cooperate privately with the domestic enemies of that government for its overthrow. We have Hawaii. But it was always the settled policy of our State Department, regardless of what political party was for the moment in the ascendent, from the very early days, and on thru Mr. Webster's administration of that department down to Mr. Bayard's, that no foreign power should ever be permitted to annex the Hawaiian Islands. They would make a naval base for a foreign power too dangerously convenient to our Pacific Coast. Hawaii lies in the Western Hemisphere, and so does the manifest destiny of this republic.

Yet we have the Philippines, and we have the Monroe Doctrine, and we cannot continue indefinitely to practise government against the consent of the governed in the Eastern Hemisphere while preaching to Europe that it will be considered intolerably unrighteous in the Western. This, I confidently believe, is one of the great problems President Wilson had in mind when, in the greatest inaugural address since Lincoln, he summoned all patriotic forward-looking Americans to his side and said: "God helping me, I will not fail them, if they will but counsel and sustain me."

J. H. BLOUNT.

THE NEW BOOKS

The Jews in America

Peter Wiernik's *History of the Jews in America*[1] is a useful and valuable work, and is the first attempt at a comprehensive, consecutive treatment of the subject. In fact, it might more properly have been termed "The Jews in America, Historical and Descriptive," for a large section of the work deals with the present condition of the Jews in the United States, and particularly with the Russian Jewish immigration of the last thirty years. The author frankly discloses this purpose, and emphasizes the fact that, as the two or three thousand Jews who lived in the United States a century ago have "increased to nearly as many millions, the bulk of them having come in the last three or four decades, . . . the story would be less than half told, if attention were not paid to contemporary history," so that he undertakes "the plan of including in the narrative a comprehensive view of the near past and the present."

Frankly, then, the historian writes as a comparatively recent Russian Jewish immigrant, with Russian-American Jews as his main proposed public, and not the least value of the book is his accurate knowledge and description of this section of our population and its history, which substantially no other writer has even attempted to treat heretofore. One writing about the immediate present is likely to have a faulty perspective and to exaggerate some things of particular interest and significance to him, and to belittle or ignore other persons and movements further removed from his sympathies, including many names and incidents that have not yet established their right to be regarded as history. Not the least remarkable thing about the work is the fact that the author should have written this book, issued by the publishers of a Yiddish newspaper in New York City, in the English language, since it is his effort to reach the immigrant reader. This circumstance speaks volumes for the pace of the Americanization of Russian Jewish immigrants. It is also characteristic that so comprehensive an historical work on the American Jews, the preparation of which has long been contemplated by students of the subject born here, should have been first actually executed by a newcomer. The extent to which this work was written for and deals with immigrants is indicated by the copious use, in parenthesis, after the proper names often appearing in it, following the date of birth of designated persons, of the letter "a" with a date to indicate the date of their arrival in the United States, and the frank formulation of the claim of the author (pp. 243-4) that the period antedating the Russian May Laws of 1881 were employed by American Jewry "in preparing for their historic mission of receiving the great masses which were soon to be driven thither from the Slavic countries by the iron hand of persecution." It should not be assumed, however, that the work before us is of interest or value only to the Russian Jewish immigrant—quite the contrary is the case—but allowance must be made for the author's point of view.

Mr. Wiernik deals also with the important participation of the Jews in the discovery of the New World, the Jewish victims of the Inquisition and of Iberian persecution in America during two centuries following the discovery, the Jew in the Dutch and English colonial periods, Jewish activity in the Revolution and the period of expansion, the German period of immigration and the Civil War and formative period. These topics are well handled, tho briefly, and the author frankly concedes that he has made no original investigations here, but has summarized, generally with tact and judgment, the investigations contained in the twenty volumes of the publica-

[1] *History of the Jews in America.* By Peter Wiernik. New York: The Jewish Press Publishing Co. Pp. 449, xxiv. $1.50.

tions of the American Jewish Historical Society and in the articles of the Jewish Encyclopedia, with occasional use of the books of Kayserling, Daly, Markens, Wolf, etc. Occasional bibliographical references enable the uninitiated reader to pursue more detailed investigations. The important services of the Jews in paving the way for and aiding in Columbus's discovery are well outlined, as are also the large and important Jewish settlements in South and Central America in the sixteenth, seventeenth and eighteenth centuries, and their important relations to the development of our commerce. The early American Jewish disabilities, even in the Dutch and English colonies, are indicated, as also the influence of the Jewish Bible upon the origin of our republican form of government. The author's theories that the Portuguese Jewish settlers arrived here as men of wealth in general, and that the German immigrants were, for the most part, on arrival, men of education and liberal in views, are, however, fallacious, and Mr. Wiernik fails to do justice to the German Jew in America, and adopts his compatriots' antagonism to the reform movement and its leaders.

In the sections of the work entitled "The Third or Russian Period of Immigration and the Twentieth Century, Present Conditions," the author treats of the period, beginning about 1881, which saw the Jewish population of the United States increase from about a quarter of a million to about two million, and here our author has no previously published continuous narratives to draw upon, but had to gather his material first hand, with only occasional use of Hutchins Hapgood's work, the Jewish Encyclopedia, and the Jewish Year Book. Despite faults already outlined, and the author going so far afield as to devote almost entire chapters to a study of our immigration laws, the passport question, Sunday laws and the labor movement, it is this very section of the work which is likely to prove most useful to the student, since it is practically untilled ground. It cannot be said that the twenty-six illustrations accompanying the book add to its attractiveness, nor does the glazed paper on which it is printed.

Mr. Wiernik has all the same contributed a useful study, valuable both in American and in Jewish history.

Jean-Christophe Again

In our issue of February 20 we reviewed Romain Rolland's monumental novel, *Jean-Christophe*, complete in ten volumes of French prose. Now, however, the third and final volume of Gilbert Cannan's English translation is issued by Henry Holt & Co., and with it the second printing of the earlier volumes ($1.50 each). This is a work of truly international value. Thus we read in the London *Athenæum* this tribute of high praise:

> *Jean-Christophe* is a study of modern France from without—not only in the person of the hero, who is a German, but also in a much deeper sense. There has been of recent years a great revival of provincial patriotism in France, so much so that a humorist was able the other day to allot the departments among leading writers, leaving only a few blank spaces on his map; but M. Rolland's way of thinking of France is not of the same order as that of M. Barrès, for example. M. Rolland thinks of France as a man of another race does: admires her for the same quality, finds in her the same faults. Hence it is not surprising that his work is appreciated as widely abroad as in Paris. . . . He has written, not the history of a generation (as he believes), but a criticism of it. It is a picture of a France which, under its incessantly changing surface, remains the centre of civilization, and so should interest every civilized man and woman.

Here few reservations, if any indeed, are made; the *English Review* is less uncritically enthusiastic. "He has affected," the reviewer writes of M. Rolland, "a somewhat too ostentatious contempt for . . . indispensable qualities of a literary work"—i. e., for form, composition, arrangement, proportion and measure. THE INDEPENDENT has written on this subject: "There is something positively Teutonic in M. Rolland's style and standpoint beyond the mere fact that his chief protagonist is a German." This is much the view of the *English Review*, which holds that if M. Rolland had respected those considerations of form and arrangement which it is fashionable today to despise he would have written only half so much as he has, and said just as much. It was Pascal, was it not? who said that he would have written a smaller book if only he had had more time.

M. Rolland has, all the same, produced one of France's best books in the new century, and one which rewards its readers at home and abroad.

Art in Egypt

There is no better authority on Egyptian art than G. Maspero, Director-General in charge of the antiquities of that land. His latest volume, *Art in Egypt* (pp. 313; Scribner, $1.50), is a very compact handbook, divided into chronological periods, and

with over five hundred illustrations. The latter would be instructive even without the text. The notable characteristic of Egyptian art, by which it differs from Greek and modern art, is the fact that it never aimed at beauty, but only at faithfulness and durability. Its art was in honor of the dead, and it wished its creations in stone to please the spirit of the dead for all eternity. So it was massive and direct and exact, not beautiful, except in a secondary way. Greece turned aside to beauty, and its genius has captivated the generations. The reader of this very compact volume will learn, as he passes from dynasty to dynasty, and even from chiliad to chiliad, how little the Egyptians borrowed from other nations, and how completely foreign motives or methods were transmuted and absorbed in the old style. What we miss, because so little is yet discovered, is the very beginnings of the native art, that for which the present archeologists are assiduously seeking; but what we have is immense in quantity and is here treated with full knowledge and skill.

Business Documents of Babylon

In a sumptuous volume on *Babylonian Business Transactions of the First Millennium B. C.* (quarto, pp. 49 and 54 plates; privately printed), we have the first of a series of Babylonian texts from the library of J. Pierpont Morgan, copied and fully indexed by the indefatigable Prof. Albert T. Clay. The translations are reserved for a subsequent series, and the tablets are all of a business character, belonging for the most part to what are called temple archives, and dealing with loans (in one case at 20 per cent interest), payments, deeds and sales. Two of these tablets antedate the first millennium B. C. and belong to the reign of Nebuchadnezzar I, and are the first transactions of his reign to be published. Of his greater successor of the name there are scores of tablets. Of three other kings of Babylon one finds here the first records. This indicates the historical value of these rather dry business documents. Even the lists of names are of importance, as is seen in the fact that the majority of the names of persons connected with the temple are West Semites and not Babylonians.

Wits and Witticisms

The clever persons whose sayings are recorded in Walter Jerrold's voluminous *Book of Famous Wits* (McBride, Nast & Co., $2.50) range over a period of time from Queen Elizabeth to Queen Victoria, and include barristers, politicians, actors and literary men. In 322 pages every one can find many good laughs, tho British puns of the seventeenth and eighteenth centuries do not always read as amusingly to us as they may have sounded to their auditors at the time. About the beginning of the nineteenth century the humor begins to assay a higher per cent of good ore. Sydney Smith furnishes some of the best samples of this. Thus, "Sir Edwin Landseer, having . . . offered to paint his portrait, received the quick reply, 'Is thy servant a dog, that he should do this thing?'" Whistler and Wilde contribute a number of clever and cruel sayings, as, for instance, the remark of the latter: "Meredith is a prose Browning—and so is Browning."

The Apostles' Creed

The theological strife in Germany over the proposed elimination of the Apostles' Creed from the service of the established Church is growing more intense and is engaging the attention of some of the most competent religious leaders. Among the defenders of the symbol, Prof. Kunze, of Greifswald, takes high rank. In his work on *The Apostles' Creed and the New Testament* (Funk & Wagnalls, 75 cents), translated by Prof. George W. Gilmore, he tries to show that this creed, substantially in its present form, goes back to Apostolic times and is echoed in the New Testament. It is difficult to see how his reasoning can stop short of the position of Grundtvig, that the creed was prescribed by Jesus himself, and yet Dr. Kunze rejects this view as wholly untenable. The author gives no real evidence of the early use and presence of the creed, but merely shows that its fundamental ideas can be traced back to Apostolic times, and this contention few would dispute. His conclusion that the Apostolicum "is supported by the New Testament and cannot be opposed on grounds found within it" is entirely vitiated the moment we acknowledge that there are conflicting teachings in the New Testament itself, and this many honest investigators have felt compelled to do.

Psychology in Business

One of the more interesting developments in business during the past decade has been the introduction of what are called efficiency methods, applied to manufacturing and trade. Wonderful results have been reported in the way of reducing labor costs and in some instances increasing wages.

When the performance of Mr. F. W. Taylor became known there was a rush of efficiency "experts" into the field, and the result could be nothing but disappointing.

Now comes Professor Hugo Munsterberg and remarks, in vocational training and scientific management, "a vague longing for psychological analysis and psychological measurement, but in both cases so far everything has remained on the level of helpless psychological dilettanteism." His most recent book, *Psychology and Industrial Efficiency* (Houghton, $1.50), makes interesting suggestions for the application of psychology to industrial problems. His book ought to prove useful to owners and managers of factories, men who wish to make the best of themselves and their opportunities, and students of industrial conditions. It is divided into three parts: the best possible man, the best possible work and the best possible effect. Perhaps one-third of it is devoted to a careful and understandable report of experiments made at Harvard to determine standards for the examination of motormen, sailors, telephone operators, and others.

Wagner's Bayreuth Letters

In *The Story of Bayreuth as Told in the Bayreuth Letters of Richard Wagner* (Small, Maynard, $2.50) Caroline V. Kerr has produced a work which will rank high as a reference book for such Wagnerian enthusiasts as desire to see what the Bayreuth master had to contend with before the hight of his ambition was realized. Wisely, however, the editor has generally omitted from her collection the tedious epistles in which Wagner refers to his own physical and financial ills. Acknowledgments are made to Henry T. Finck for historical notes, and resumés connecting different stages in the Bayreuth period.

First Love

A sequence of verses, with something of the real ecstasy of wedded love and the despair of loss in them, makes the substance of Louis Untermeyer's volume *First Love: A Lyrical Sequence* (Boston: Sherman, French & Co.). The heaven of true love and the hell of well-based doubt or of unfounded suspicion play their part in many a first year of wedded life, that looks rosy enough as bride and groom step down from the altar and disappear under the dim light of the honeymoon. Against this the novelist usually draws the curtain. Our poet takes it up *con amore* as his theme and sings the hymeneal with its bliss without shrinking at the bars that mark the sharp descent into what is not bliss. The effect is dramatic in the extreme—action, picture, reflection, and choral comment, all compact in lyrical measures, and the poet quite justified in making himself a part of the play:

> The linnet is tuning her throat,
> The bees are beginning to swarm,
> And the music of blossom and root
> Is throbbing and joyful and warm.
> I am part of the lyrical strife,
> I am one with the voices that sing—
> While even the stones feel a hunger for life
> In the urge and the clamor of spring!

The Flaw in the Crystal

Miss Sinclair's new novel is most uncanny. It gives one a creepy horror to think that one human being may be absolutely in the power of another when at a distance. The author assures us that Agatha's Power (which is always capitalized) is a beneficent one and used to drive away the dark and dangerous moods of the two men upon whom she uses it—but, frankly, we don't like it! The story is unreal and unwholesome, altho written with Miss Sinclair's usual skill. The heroine's brave attempt to minister to a mind diseased and drive away its haunting fear by force of some occult Power, only to find the "Flaw in the Crystal," renders her own soul vulnerable, is so abnormal that we lose patience with the intangible struggle, slight as crossing cobwebs of the mind. And we resent the invasion of one personality upon another, unpleasantly present in much of the New Thought literature. The use of hypnotism as a cure by a specialist in mental disease is one thing; this amateur meddling with other people's minds is quite different and not without danger, as Agatha discovers. (*The Flaw in the Crystal.* By May Sinclair. New York: E. P. Dutton & Co. $1.20.)

West African Experiences

Robert Hamill Nassau's book, *In an Elephant Corral* (Neale, $1), is the work of a missionary, but not about mission work. He recounts vacation experiences of travel and hunting in the wilderness of the Gaboon country, many years ago, when that region and its natives were even wilder than at present, and gives, by the way, much legendary material of interest to folklorists. Dr. Nassau sent to the United States much of the earliest material—skins, skeletons, brains, etc.—possessed by naturalists for a study of the gorilla, whose scientific discovery may, indeed, be credited to another American missionary, Dr. Sav-

age, of Boston. The author of this book was untiring in his energy and care in obtaining these specimens and a knowledge of the mysterious ape, and his long chapter on the gorilla is the best part of his book.

Literary Notes

Simple directness of presentation, accurate knowledge, and good counsel are some of the commendable characteristics in Dr. E. B. Lowry's book entitled *Himself: Talks With Men Concerning Themselves.* (Chicago: Forbes & Co.; $1.)

From the Knickerbocker Press we receive a monograph by Eba Anderson Lawton: *Major Robert Anderson and Fort Sumter, 1861* (pp. 19). Several facsimiles illustrate this record of Anderson's service in Fort Moultrie and Fort Sumter.

Why W. L. George wrote *Until the Day Break* (Dodd, Mead, $1.30), unless to try and voice the struggle of labor to find itself, it is hard to guess. As a novel it is inadequate and depressing. As a labor document, we find it too mystical and lacking in definiteness. Yet the book expresses the dreams, aspirations and fears of the author.

A poorly written life of the Right Reverend Ellison Capers, *The Soldier-Bishop of South Carolina,* has been issued by his son, Rev. Walter B. Capers, thru the Neale Publishing Company ($3). Bishop Capers, who served as an officer in the Confederate Army, became in after life a strong influence in the religious and educational affairs of his native State.

From the Doubleday-Page Press comes the seventh edition of Mr. Arthur W. Dow's *Composition,* and the fact of its having run thru so many editions is good evidence of its usefulness to teachers and students of art. It is, in fact, useful to others than art teachers and students, as it is one of the rare books about art easily comprehended by the layman.

The Japan Society of New York will publish at an early date the lecture on Japanese color prints delivered by Frederick Gookin before the society in April, 1911. This lecture was given in connection with a notable exhibition of Japanese color prints, and the catalog of this exhibition—including as it does identifying descriptions of the prints, and biographical notices of the artists—will form a part of the work. The reproductions of representative prints are the result of a new soft tone process which presents the character of the originals with more than usual fidelity, and the volume will consist of more than fifty pages of text besides some twenty-five full page reproductions. This quarto volume will be issued from the DeVinne Press of New York.

There seems to be no principle guiding Mr. A. W. Macy in his selection of *Curious Bits of History* (New York: Cosmopolitan Press, $1). The anecdotes, which fill more than 200 pages, averaging half a page in length, are chosen from all periods of history. Many of these tid-bits are entirely without authority, but most of them are entertaining.

Tho some authors read little except their own writings, this cannot have been true of Goldsmith, for at the sale of his library it contained not one of his works save an imperfect copy of the *History of the Earth and Animated Nature.* Two volumes of *Miscellanies,* a pamphlet, two plays, and the second edition of *Wild* were the only works of Fielding in this greater writer's library, at his death: yet the library as a whole went for £350.

A book which we have set apart for a second reading is Warwick Deeping's *The Strong Hand* (Cassell, $1.35). It is admirable in its sincerity, captivating interest, the charm of its leading characters. The hero is a young doctor who comes as assistant to the family physician of a small town, comes with a program of sweeping sanitary reforms that gets him into the bad graces of the property owners. However, it is all for the best, and we leave him a London specialist.

The perplexed hostess in her search for some new form of entertainment will find suggestions in *"Dame Curtsey's" Book of Party Pastimes for the Up-to-Date Hostess,* by Ellye Howell Glover (McClurg, $1). The pastimes are arranged chronologically, beginning with New Year's Day, and a "Good Resolution Party," which looks funny and feasible. Then there are new and pretty ways of announcing engagements, and a great many other pleasant devices to please varied tastes.

Thorny, by Alexander Black, is a very pleasantly written desert-island story, full of tropical sunshine and the perfume of luxuriant forests. There are no animals on the island, wild or otherwise, no savages and only a very manly young He and a winsome and attractive She. The only novelty in the book is the fact that when He lands there from the wreck, he finds She, who was left there six years before and has kept her sanity and poise all that time. There is nothing original, exciting or startling in the story; it is merely pleasant, picturesque and sunshiny. (McBride, Nast & Co., $1.25.)

Drawn by C. R. Weed.

PUBLIC MINDED CITIZEN: "I would ha' accepted that post meself, Jim, but how was I to keep up me *position* on $17,000 a year?"

SURVEY of the WORLD

The Best Light for the Eyes

The principle of "concealed lighting" is rapidly gaining way, and it is predicted that within a few years it will be almost universally put into practice. It is pointed out that the system of putting the source of light in plain view is wasteful because the dazzled eye demands a greater flooding of the air with diffused illumination in order to see clearly. When the light source is concealed, a far less intense illumination is required.

In the reading room of the British Museum the artificial illumination is only seven one-thousandths of daylight, at the woolsack in the House of Lords only six one-thousandths, and at the clerk's desk in the House of Commons only one twelve-hundredth; yet in all these cases the amount of illumination is satisfactory, because there is no "stabbing" light from visible sources.

Why Children Are Blonds or Brunets

The pigments that color the human skin are of two kinds—a diffuse yellow-red and a melanic or black. The latter occurs in granules in the deeper layers of the skin. These discontinuous granules form, in reality, a mosaic, but the mosaic is so fine that, to the naked eye, the skin appears uniform. The color of the skin of any individual depends mainly on the size and number of these pigment granules. What the size and number of the granules will be will in turn depend on the hereditary history of the individual.

We generally recognize, among Caucasians, three main types of skin pigmentation; namely, blond, intermediate and brunet. When we group them according to their hereditary behavior they fall into three classes.

First, when both parents are unquestionably blonds then all of their children are blonds. The parents have little pigment to transmit hence the children can inherit little and no child will be darker than the darker blond parent.

In the second class occur matings of blonds either with brunets or those with intermediate pigmentation. In both combinations about half of the children will be blond in a large population and half pigmented. What the proportion in a particular family will be, will depend on two factors—namely the hereditary history of the dark parent and on the number of children in the family. If the dark parent has derived dark skin color from both parents, we say he is duplex in respect to brunet skin color. That is to say, he has a double dose for brunet skin. In people of duplex origin all germ-cells are of the same kind. Hence when a blond marries a duplex brunet all the children will be brunets, but some of them will probably not be as dark as the dark parent. If the dark parent is of mixt origin as is usually the case—if he had one light parent or grandparent—then half of his children will be blond and half brunet.

In the third class occur all matings in which both parents have some degree of pigmentation. The possibilities of color combinations in this class are three: brunets with brunets, brunets with intermediates, and intermediates with intermediates. In all three matings about 25 per cent of the children are blonds.

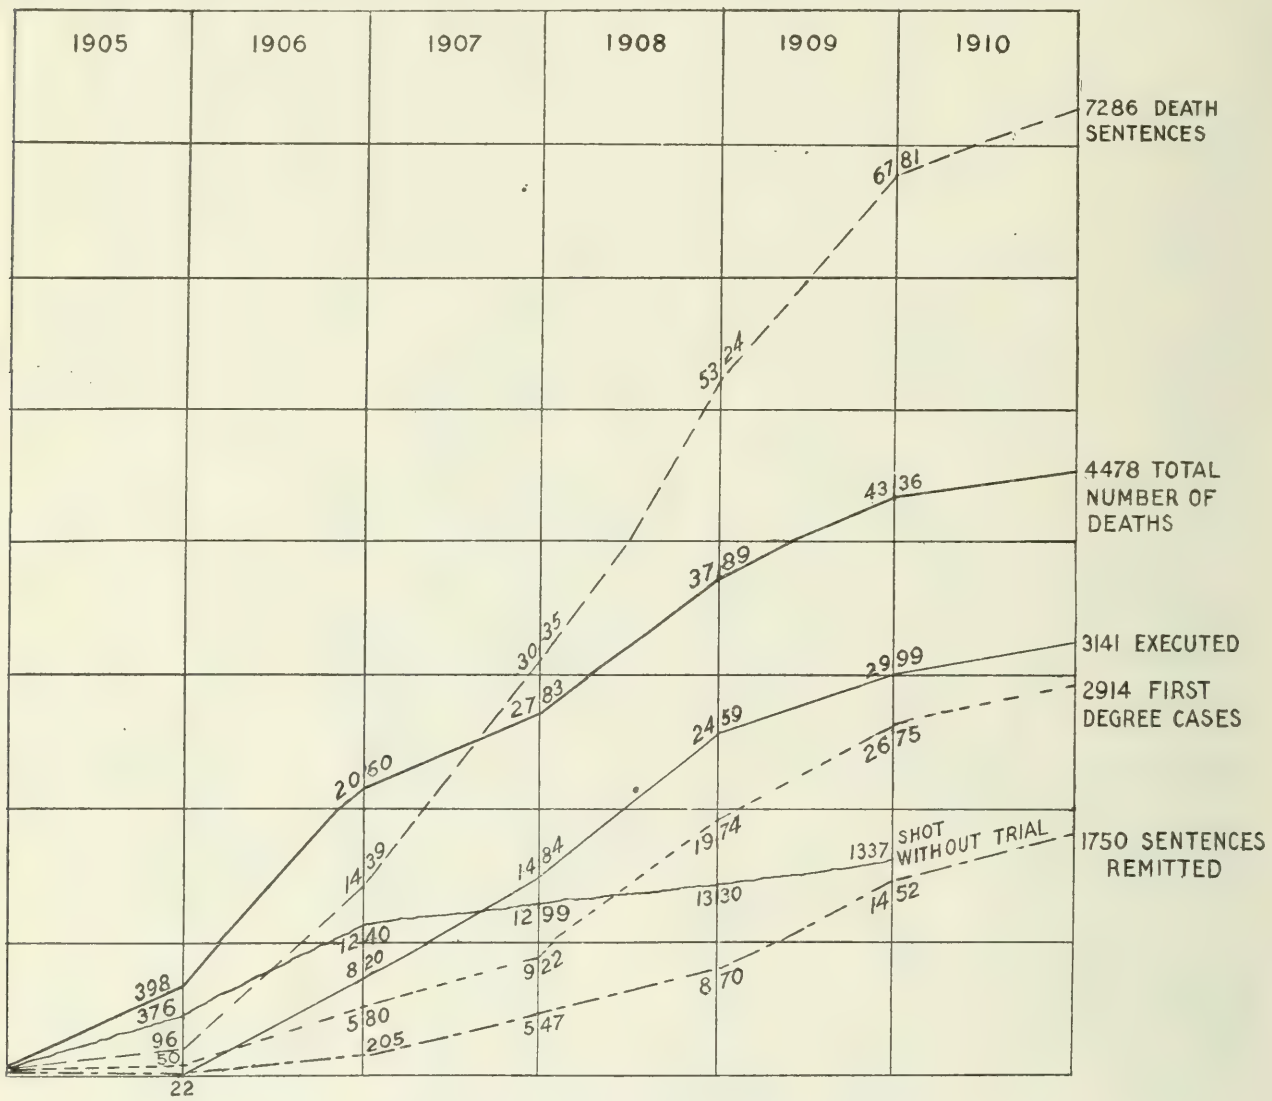
Carnegie Station for Experimental Evolution.

The Split Session

California has just completed her initial trial of a new legislative device. At the constitutional election in the fall of 1911, when the woman suffrage amendment was adopted, the people also adopted an amendment providing that the regular biennial sessions of the Legislature should be divided into two parts. The first part of the session under this novel law must come to an end within thirty days and must be confined to the introducing of bills. No measure can be acted upon. A recess of not less than thirty days must then be taken. Upon the reassembling of the Legislature after this recess, no bill can be introduced in either house without the consent of three-fourths of the members; the object being to devote this second half of the session to action upon the bills introduced during the first half.



The design of this new constitutional provision is to give the legislators an op-

portunity to consult with their constituents in regard to pending legislation, and, on the other hand, to give the people an opportunity to express their views upon the bills, so that legislation may as far as possible reflect the wishes of the people.

During the five weeks' recess which the Legislature took this year, the Senators and Assemblymen returned to their homes, and individually and collectively held public meetings, at which the people were invited to offer recommendations or objections or to ask questions concerning any measure in which they were interested. The various women's clubs thruout the state availed themselves of the opportunity to have the legislators come before them and discuss with them the proposed measures in which women voters are especially interested—minimum wages, child labor, marriage health certificates, mothers' pensions, equal guardianship and a score of others of like general character. Various political, commercial and industrial organizations also took like advantage of the occasion, so that the legislators found themselves as fully occupied during the recess as when in session.

The Blood Cost of Repression

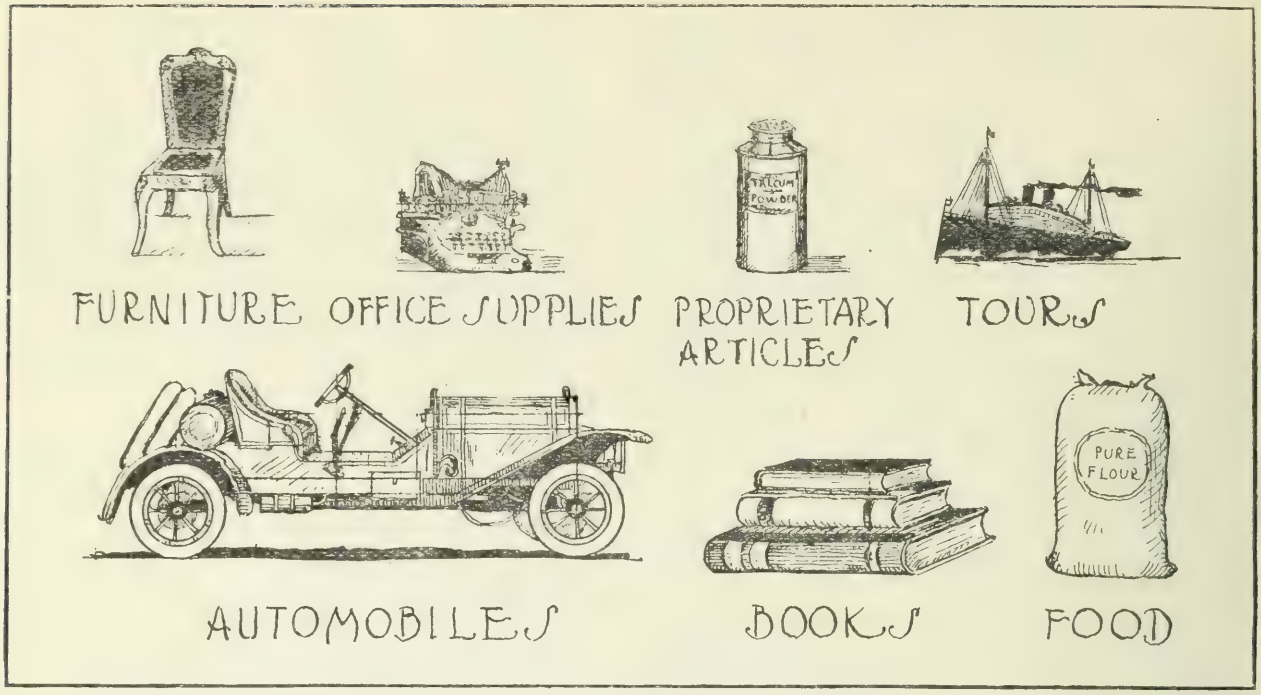
During the six years (1905-10) of the intensive period of the Russian revolution, 7286 men, women and children were condemned to death punishment in the military and the ordinary courts of the Russian Empire, altho only in two-fifths (2914) of the cases were the crimes attributed to the prisoners punishable by death according to the Russian law. One-fourth (1750) of the persons sentenced were subsequently pardoned. Out of the remaining number of 5536 persons, according to the incomplete newspaper statistics, 3141, or two-fifths of the total number of condemned, were executed. Nothing is known as to the fate of the rest of the condemned (2395). Moreover, 1337 persons were shot by soldiers without any trial whatever, at the mere order of their military commanders, the

DEATH SENTENCES IN RUSSIA, 1905-1910

This includes both ordinary capital cases and revolutionary executions.

total of deaths amounting, therefore, to 4478. In other words, during this reign of terror, there was on the average one man condemned to death punishment to every 18,000 people of population of the Russian Empire, and one executed to every 29,000. The number of executions rose to 1662 in 1908; 864, or more than one-half, having been shot without trial, and fell to 142 in 1910, out of 298 death sentences in that year. The number of 1337 persons shot without any trial during 1905-9 is about four times as large as the total loss of the American army during the three years of the Spanish-American War.

The crimes committed were not only of political nature, for the least offense, or the smallest theft, was often punished by death at the order of the military despots, sometimes mere subalterns. In some cases the executed were mere children, fifteen years of age; in other cases the subsequent inquiry proved the innocence of persons executed, who were victims of false witnesses, induced either by governmental rewards or personal enmity. The reign of terror has, in fact, not abated as yet, for tho the number of sentences fell to 293 and the number of executed to 73 in 1911, during the first eight months of 1912, 214 persons were condemned and 83 of them were executed, showing again a rise of the bloody wave. None of these figures include the losses on the side of the Government (army and police), and they were by no means very small.



Why Is Death Necessary?

We are so accustomed to consider death an inevitable result of living that recent results obtained by some of the biologists on the length of life of protoplasm are of much interest. Weismann's theory, that death did not originally follow life, but arose thru the process of natural selection, did not seem to be borne out by experimentation. Weismann claimed that natural death in the lowest forms, namely, protozoa, does not exist, but that as we go up in the scale of development, it becomes necessary to have the old worn-out bodies replaced by new stock, and hence we get the action of natural selection to keep the races ever fresh.

We all know that perpetual life does not and cannot exist in higher organisms, but how about the very lowest forms? Professor L. L. Woodruff, of Yale University, would seem to have quite definitely settled this question for at least one form, namely, paramœcium, or the "slipper animalcula." This is an organism which has long been used by biologists in a great variety of experiments, and is consequently very well known. A culture of these animals kept in a laboratory shows that the individuals at intervals divide. Then there will come a period when many will unite with each other. Microscopic examination shows that in this conjugation there is an exchange of nuclear material, so that each animal receives into its body or cell a part of the animal with which it mated. Conjugation always seems to occur when the culture is in a run-down condition; that is, when the environment in which the paramœcia are living becomes more or less unsuitable to their existence.

Numerous experiments have been made to find out just what is the cause of this conjugation and to answer the question, "Cannot paramœcium live on forever, without conjugating, merely dividing when the cell has attained its full size?" In other words, are the lowest forms of life potentially immortal, as Weismann claimed them to be? One cannot but feel that Professor Woodruff has proved that Weismann was right in his contention. He found that under favorable conditions—when the organisms were not too crowded, and the culture medium was changed frequently and kept free from bacteria — paramœcium would live apparently indefinitely. Five years ago, he started an experiment with a single individual in an environment best suited to produce healthy, vigorous animals. Since that time this single cell of protoplasm has passed thru 3500 generations without at any one time passing thru the stage of conjugation. And as the animals in the line of descent become older, they show no diminishing of their vital powers. In fact, they are in a more vigorous condition today than they were five years ago.

Since Professor Woodruff has found that a single cell can perpetuate itself for more than three thousand generations without receiving any new elements from another individual, what then is the reason that, under unfavorable conditions, paramœcia conjugate with each other? Dr. Jennings, of Johns Hopkins University, has found the answer to this question by studying the behavior of paramœcia in unhealthy surroundings. If conjugation is not permitted to take place, all the individuals die. On the other hand, when conjugation does take place, there will be a large number of individuals which have now received new substance into their bodies. Many of the reconstructed individuals will now be no better able to withstand the unfavorable environment than in their former state and will die. But there will be some few animals which have just the right make-up to live in this environment, and these will

WHAT GOODS ARE MOST ADVERTISED?
This chart shows the relative amount of space given to the seven leading commodities in eleven magazines.

flourish, increasing in numbers by dividing, until there has been a new population produced. Here then natural selection acts, weeding out those individuals which are not fitted to live under existing conditions. Dr. Jennings found that out of a large population of conjugating paramœcia, only three or four were suited to live in this particular environment, but these by division were able to repopulate the community.

No doubt all of us have a lurking desire to live as long as paramœcium, and wonder why it is that if such simple forms can apparently live on forever, death must come to higher animals. If we could take on the simple structure and vital economy of the unicellular organisms we would stand a chance for continuous life, but just because of our specialization, there cannot be a perpetual existence. Groups of cells in our bodies are highly specialized into certain organs, each dependent upon other organs for their existence. When one part gives out, other parts must suffer, and finally the entire system succumbs. The penalty of our highly developed organization is death.

Maine Agricultural Experiment Station.

Advertising

In order to measure the comparative amount of space devoted to the advertising of different classes of articles in the leading magazines a study was made of the January issues of eleven magazines of a general nature. The magazines consulted were: *Scribner's, Century, Harper's, McClure's, Munsey's, American, Atlantic Monthly, Strand, World's Work,* one issue of the *Saturday Evening Post,* and the four December issues of THE INDEPENDENT. In these numbers 598½ pages were devoted to advertising. The chart at the top of the page shows in order the classes of articles to which the most space was devoted. The size of the advertisements varied from two pages in some cases to a small insertion in others.

The following classes of articles appeared in more than twenty-five separate advertisements:

Books and magazines	197
Financial	93
Tours	72
Automobiles	67
Food	67
Furniture	60
Education	52
Office supplies	41
Proprietary articles	40
Medicine	28

It is next to impossible in this country to open the eyes without encountering some form of advertising. While walking on the street we see the displays in windows. From vacant lots billboards stare at us. Over our heads in trolley cars there is a row of advertising cards. The same is true in the subway. Along the elevated roads signs are painted on the sides of buildings to attract our attention. When walking the streets at night our eyes are drawn to multicolored electric bulbs which blink advertisements at us. If we drive along a

country road trees and fence-rails bid us patronize some store only a few miles away. If we get on a passenger train we ride between miles of huge signboards, and the barns along the track are one huge sign. Our newspapers carry almost as much advertising as news matter, and the articles in magazines are tucked between pages of advertising.

If we are not the greatest spenders in the world it is not because the virtues of wares are not sufficiently impressed upon us.

WM. B. BAILEY
Assistant Professor of Political Economy, Yale University.

Trouble Again in the Culebra Cut

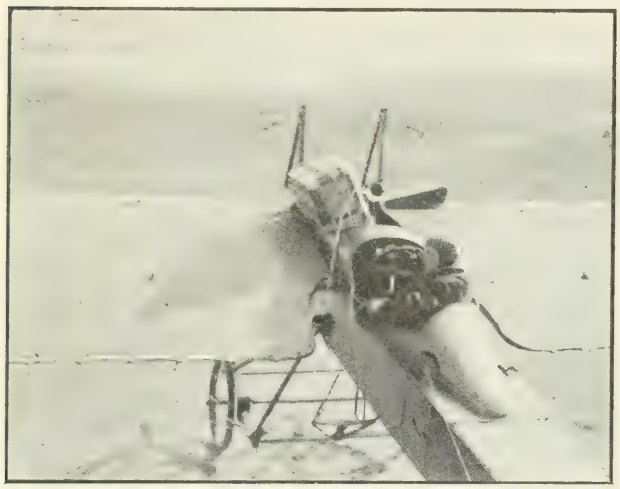
Troublesome slides at several points in the banks of the Culebra Cut continue to pour masses of rock and earth into the Panama Canal channel and to increase materially the amount of excavation required to complete the canal.

The total excavation from the Culebra Cut is estimated at 100,000,000 cubic yards. Of this total 21,000,000 cubic yards, or more than 20 per cent, has been due to slides. These slides cover a total area of more than 200 acres. They show greater activity during the dry season than during the rains.

On March 13, 2,000,000 cubic yards of earth were involved in a second movement in the large slide in the east bank of the canal opposite the Culebra railroad station, heaving up the floor of the canal for a distance of 1000 feet. The ridge thus formed was in some places as high as 30 feet. Four construction tracks were reduced to a tangled mass of wreckage, one steam shovel was overturned and badly damaged, and excavation work on the toe of this slide was temporarily suspended. The photograph shows the tracks twisted and deposited in the pioneer cut in the center of the canal. One track was kept open, and satisfactory communication was restored after four days' work of two steam shovels.

Culebra slides began to be troublesome as long ago as 1884, when the French were working in the cut. They are due to the irregular geological formation of the Isthmus, which is here composed largely of sedimentary volcanic ash, not completely hardened into rock, which rests on a hard underlying stratum. This material will slide down the sides of a steep cut until a stable slope has been formed.

In other cases the underlying rock is soft and, as the excavation is deepened, tends to crumble under the weight of the sides of the cut. The softer rock at the foot of the cut is forced up in a ridge on the canal bottom by the sinking rock above it, as was the case in the slide which is pictured.



Colonel Goethals has reported that all indications point to the fact that the slides can eventually be completely ended, and there is no expectation that they will cause a postponement of the opening date. Except for the slides, the excavation would have been finished by this time.

CONSTRUCTION TRACKS WRECKED BY A CULEBRA CUT SLIDE
A ridge of earth and rock, forced up by the slide, extended for 1000 feet along the canal bottom and reached a maximum of 30 feet.

The Flying Trunk

For the first time in aviation history, a trunk has been sent by the "air lanes" to its destination. The thirty-odd miles between Dominguez and Pasadena, California, was covered on New Year's Day by a huge monoplane bearing a fifty-pound trunk. It sped at better than a mile a minute and delivered the trunk in the out-

CARRYING BAGGAGE IN CALIFORNIA

skirts of Pasadena. W. L. Bonney was the aviator who carried out this novel feat, acting on the suggestion and under the direction of E. C. Learock.

Agriculture and Home-Making by Mail

Agricultural colleges have been doing a wonderful work, but they touch only here and there, and can collect at a given center only a moiety of our boys and girls. On the farms and in the homes of the country remain the country home makers who desire to learn how to make home beautiful as well as valuable. Some of these can follow special lines of study under tutors, but the most of them will find correspondence courses more available. Nearly all our agricultural colleges are now opening these courses.

The State College of South Dakota is one of the latest to announce that it will extend the opportunities of education to every home in the State. The subjects of study offered, at first, concern directly agriculture, home economics, and nature study. Reference books and bulletins will be recommended and text-books will be used. In horticulture there will be separate courses in vegetable gardening, fruit culture, floriculture, landscape gardening and forestry. Animal husbandry, poultry culture and biology will be included, with a study of bee keeping and weeds of the farm and garden. For the home itself will be taught home sanitation, principles of cookery, home nursing and handicrafts. If this is not a practical system we fail to understand what industrialism demands. Special courses are planned for the benefit of school teachers, and pastors of churches, to equip them with that sort of information which will enable them to keep up with the age. This may be fulfilling what Dean Bailey suggested five years ago, that our ministers have an "agricultural annex to their theological seminaries." None of this correspondence work will be allowed to stand in the way of a more personal relation between teachers and taught. It is held to be very desirable that at least occasional visits be made to the State college, and more or less personal conferences held with the instructors. The establishment of good libraries all over the State is specially recommended.

The modern college does not stop at this point, however; it places as strong an emphasis on the beautiful as Plato or Horace ever did. Our Dakota college introduces the home student to horticulture, after this manner: beauty is wealth; the mission of beauty is the home; the preparation of the ground and the preparation of the owner. The agricultural colleges in general are widening their outlook, and the end is beautiful homes and stronger characters.

Meanwhile the growth of our agricultural college enrollment is astonishing. Figures for 1913 put Cornell at the head, with 1135 students; followed closely by Wisconsin, which has collected at Madison 802. Illinois has 732 farmers' boys and girls; Ohio State University follows with 720. Syracuse has 177 students of forestry; leading Ohio with its 74, Nebraska with its 64 and Yale with 40. All these are coöperating with the great public sentiment in favor of a conservation of national resources, and making such preservation of our national wealth possible. Education has joined itself with the great railroad systems of the country, until corn trains are just as well known as "Dixie Flyers"; and both college and transit systems are looking to social betterment, increased food supplies, and closer coöperation of producer and purveyor and consumer.

Orchard schools are the poem of this new work. If anyone wishes to know just how these schools work let him visit one next summer, and while he is learning how to grow the best Northern Spies and Pippins, he can sample the new sorts, while he hears the song of the future sung by college instructors. Education no longer looks backward, but forward. E. P. Powell.

Fifty Years Ago

From **The Independent**, April 9, 1863

THE CONDUCT OF THE WAR

By Horace Greeley.

There are those who marvel that the loyal heart of the Republic is sometimes sunk in despondency or stirred to irrepressible impatience in view of the slow progress of the War for the Union. I am not of the number. I rather sympathize with the petulant remark attributed by Count Gurowski to one of the bravest and most thorough Senatorial champions of the Union War, that he did not wonder that so many persons were impelled to renounce their country and go over to Jeff Davis—that it would require but a little more provocation to induce him to follow their example. Of course, this was hyperbole, but exaggerations indicate an underlying truth. The Slaveholders' Rebellion ought long since to have been suppressed, and would have been if the means so lavishly supplied by the loyal Millions had been wisely and vigorously applied. We have made large conquests from the Rebels since the struggle began, and now hold at least a fifth of the territory and govern a fourth of the people claimed as belonging to the Southern Confederacy; yet we have not crushed out the Rebellion, because of flagrant imbecility and deadly treason in our Military councils. Half our leading officers have been at heart either adverse or indifferent to the complete success of the Union cause. They are not Disunionists; they would have the "wayward sisters" reclaimed to the family hearth; but they cannot bear to have this effected otherwise than through a "Compromise" which shall save the pride of the insurgents, protect all their interests, and leave Slavery stronger and more enduring than ever. Hence they strike irresolutely, dubiously, ineffectively. They wait to be assured that their blow will not reach too far, until the time for striking has passed.

EDITORS' BOOK TABLE

Books

G. W. Childs, of Philadelphia, one of our most enterprising publishers, announces as about to appear a new work by the well known popular scientific geologist, Sir Charles Lyell, on one of the most interesting of contemporary investigations in natural science. This is *The Antiquity of Man*. It will include some observations on the origin of species, is to be illustrated, is in octavo, of about 520 pages, price $3.50.

The total sales of some of Carleton's recent publications are worth recording, viz., *Among the Pines*, 35,000; *Artemus Ward's Book*, 15,000; *Les Miserables*, 120,000.

Pebbles

"Do you believe in upward or downward revision of the tariff?"

"If they revise it on the level it'll suit me."—*N. Y. American.*

The prisoner was charged with larceny, and a lawyer of dubious reputation was defending him.

"I submit, gentlemen of the jury," shouted the lawyer, "that the facts disclosed do not constitute larceny, altho I will concede that the District Attorney is usually a better judge of stealing than am I!"

"But a less successful practitioner," was the disconcerting reply.—*Judge.*

HIS NAME.

She ransacked every novel,
  And the dictionary, too,
But nothing ever printed
  For her baby's name would do;
She hunted appellations
  From the present and the past,
And this is what she named him
  When they christened him at last:

Julian Harold Egbert
  Ulysses Victor Paul
Algernon Marcus Cecil
  Sylvester George McFall.
But after all the trouble
  She'd taken for his sake,
His father called him Fatty,
  And his schoolmates called him Jake.

—Minna Irving, in *N. Y. Times.*

CARTOON OF THE WEEK

A NEW KIND OF KEY

—*From the Minneapolis Journal.*

THE WEEK

The Western Floods

Waters receding from Dayton and other stricken towns increased the volume of the Ohio and Mississippi Rivers, and many places on the banks of those great streams were in danger last week. Fortunately, the record shows the loss of very few lives in addition to the long list of the preceding week's dead. But thousands of persons have been driven from their homes, and there is considerable additional loss of property.

Levees on both of the great rivers have been subjected to severe strain and several of them have given way. Below Memphis, preparations for a flood greater than last year's have been made, and it is expected that there will be heavy losses on the cotton and cane plantations. Breaks 70 miles south of Cairo and at Hickman, Ky., were reported at the end of the week.

There has been much suffering in Dayton, where it is said that 40,000 are homeless. The city needs money and some suggest that a loan of $50,000,000 from the national Government should be sought. The number of the dead in Dayton was about 200; in Hamilton 75 lost their lives. Red Cross reports make the total for Ohio 460. Estimates of property loss vary. A prominent mercantile agency says it exceeds $50,000,000, and that Ohio alone loses $40,000,000. Subscriptions to the relief fund in New York exceed $650,000.

Tariff Revision

It was quite clearly shown last week that President Wilson is in hearty sympathy with the radicals of his party concerning tariff revision. The provisions of the revision bills or bill were withheld from the public, but it was known that they were generally in accord with those of the bills heretofore passed by the Democratic House. Difficulty arose on account of the proposed free-listing of raw wool and sugar.

The free-listing of sugar was opposed by the two Democratic Senators from Louisiana and by three or four from States in which beet sugar is produced. The removal of the duty is deferred until 1916. In the meantime the proposal is to cut the present rate 25 per cent.

This controversy attracted much attention just before the opening of the special session. It became known that Mr. Wilson had decided to go to the Capitol and to read his message to Congress. This course has not been taken by a President for more than 100 years. It was said also that if the passage of the bill, with its free list, should be blocked by Democrats in the Senate, he would appeal directly to the people.

Income tax legislation still depends in some measure upon the sugar duties. If these are cut off, $120,000,000 of income tax revenue may be needed. It was said that the rate on incomes in excess of $4000 would be 1 per cent, with a graduated increase rising to 4 per cent.

Other Washington Topics

The Roosevelt Progressives in the House held an open caucus or conference last week, nominated Victor Murdock, of Kansas, as their candidate for Speaker.

The President has declined to displace Miss Lathrop, the head of the Children's Bureau. To an applicant for the office he said he had promised to retain her. H. B. Fine, of the Princeton faculty, has declined to become Ambassador to Germany. It is expected that Joseph E. Davies, of Wisconsin, who had charge of the Wilson campaign in the West, will be made Governor of the Philippines, or will hold some office in the islands, where he will study the situation as the President's representative.

Only one State more is needed for the amendment providing for direct election of Senators. The President's summer home will be in Cornish, N. H.

Unfortunate Mexico

The northern States in revolt against Huerta's Government would like to have their belligerency recognized at Washington, and there has been some talk about seeking annexation. Ignacio Bonillas, a member of Sonora's Legislature, has started for Washington in the interest of an annexation project. Huerta sent an optimistic message to the Mexican Congress on the 1st. All the States except Coahuila and Sonora, he said, cordially accepted his Government, and complete pacification was near at hand. The facts, however, do not justify his optimism. By desertions and otherwise the

regular army has been reduced to about 14,000 men. Zapata is active south of the capital, and troops for the north cannot be spared. It was reported that Zapata had killed the elder Orozco, Huerta's peace envoy, and the son asked for 5000 soldiers to use in a war of extermination, but they could not be had. It appears that the elder Orozco is alive, but in prison.

A story was published on the 3d to the effect that Huerta, to satisfy all factions, had consented to retire in favor of Pedro Lascurain, Madero's Minister of Foreign Affairs, and that Carranza, the rebel leader in the north, had accepted this concession. Two days later, however, Carranza, who had proclaimed himself Provisional President, published a long statement, addressed to the American people, in which, after reviewing the history of Mexico's recent revolution, he asked whether Americans would submit to a dictator who had assassinated the President and Vice-President at Washington. Lascurain, who was in New York and Washington last December, and was regarded as an advocate of peace, is now on his way to France, intending to make his home there. The Finance Minister reports to Congress that the balance in the Treasury is only $16,539,000, and that $9,410,000 of this is a monetary commission fund, which must not be disturbed. The Government is trying to negotiate a loan in Europe.

There was some fighting, last week, in the north. A town near Lampazos, and 75 miles from the boundary, was captured by the rebels, after a sixteen hours' battle in which they lost eighty men. Owing to disturbance in and near Cananea, the American mining and smelting plant there was closed, and 3000 men were deprived of work. In Hidalgo, 250 rurales revolted, and at Toluca there was a similar revolt, owing to the murder of Hernandez at the capital by Governor Zepeda. Hernandez had been a Maderist commander of rurales. The capital of Durango was about to be attacked by Carranza's forces. Immediately after Madero and Suarez were killed, Huerta promised that an investigation should be made. So far as can be learned, there has been no inquiry. It is asserted that Sanchez Ancona, Madero's secretary, while trying to get out of the country, was taken from a steamship at Vera Cruz by Huerta's men and shot.

President Wilson was asked, last week, by a committee of six prominent American residents of the Mexican capital to reappoint Ambassador Wilson. On the same day charges against the Ambassador were filed at the State Department by Luis Manuel Rojas, formerly a vice-president of the Mexican Chamber of Deputies, who asserts that Ambassador Wilson was morally responsible for the assassination of Madero, whom he disliked, and for whose overthrow he conspired with Huerta. Mr. Wilson has published a sharp denial.

Other Countries South of Us

General Menocal, Cuba's President-elect, is annoyed by Asbert, Governor of Havana, and his followers. The Asbertistas, as they are called, deserted the Liberal party and voted for Menocal. Now they demand a part of the new Cabinet, with other offices, threatening to join the Liberals in Congress if General Menocal does not surrender. He insists upon having a free hand, but the threatened secession would give the Liberals a majority in Congress and thus affect the success of his administration. Late reports say that he will not yield.

The American Association for International Conciliation has published a petition, addressed to Congress and signed by Seth Low (the association's president), President Butler of Columbia University, Stephen H. Olin, George Blumenthal, Representative Bartholdt, and James Speyer, asking for a settlement of the controversy with Great Britain about the Panama Canal tolls, and suggesting several courses which might be taken. The association urges Congress "to provide that American coastwise shipping using the canal shall be subject to the same tolls as all other shipping, the Government itself undertaking to pay the amount of said tolls; or that the clause providing for exemption be rescinded; or, failing an adjustment of the controversy in one of these ways, or thru diplomacy, that the question in dispute be referred at the earliest possible moment to arbitration."

Archbishop Nouel, provisional President of Santo Domingo, has resigned, and Congress has accepted his resignation. It is said that he retires on account of ill-health. Prominent candidates for the office are General Horacio Vasquez and Federico Velasquez. Dispatches say there will be a revolt if Congress elects the latter.

Census reports received in Washington show that Buenos Ayres has been growing faster than any other large city in the world, Chicago excepted. Its population now is 1,434,830. Ten years ago it was 783,320, and in 1869 it was only 177,767.

Exporters engaged in trade with South America complain to the State Department because Brazil has not renewed the preferential tariff rates in force for some years past. The concessions related to flour, cement, typewriters, clocks, watches, paint,

etc., and some think they were withdrawn on account of our Government's suit, under the Sherman act, against those interested in what was called the Coffee Trust, or the valorization project which the Brazilian Government supported.

Mrs. Pankhurst Is Sentenced

Emmelene Pankhurst, militant suffraget leader, was found guilty of inciting persons to commit damage, and sentenced to three years' penal servitude, on April 3. She had acted as her own lawyer. Judge Sir Charles Montague Lush presided at this trial, at the Old Bailey Sessions. He might have given Mrs. Pankhurst a fourteen years' term under the law, but the jury, in finding her guilty, urged mercy.

Mrs. Pankhurst was charged with having "counselled persons whose names are unknown to place feloniously and maliciously certain gunpowder and other explosive substances, with intent thereby to damage" Chancellor Lloyd-George's country house at Walton Heath. Tho she had boasted in public of urging her followers to the act, the defendant pleaded not guilty, but after sentence had been pronounced she avowed that she had "deliberately broken the law, not hysterically and not emotionally, but for a set and serious purpose, because I honestly believe it is the only way."

"I want to see the women of this country enfranchised," she continued. "This movement will go on." The presiding justice then told Mrs. Pankhurst that if she "would only realize the wrong she was doing and would use her influence in the right direction, he would be the first to use his best endeavors to secure a mitigation of her sentence."

When the militant leader was sentenced cries of "Shame!" and "Outrage!" filled the courtroom, that contained many suffragets. To Mrs. Pankhurst's "I'll fight! Fight! Fight!" they echoed "Keep the flag flying!" and "We will rise!" Laughing at attempts to restore order, they sang a song of their own to the tune of the "Marseillaise." One woman in the crowd compared Mrs. Pankhurst's sentence with the Crucifixion. An abortive attempt at a rescue of the prisoner is reported.

"We regard the sentence of my mother as an incitement to violence," said Christabel Pankhurst, in Paris. Mabel Tuke, a militant official now in South Africa, will replace Mrs. Pankhurst as commander-in-chief of the militants. More attempts to burn houses and railway stations are reported. The women have taken to employing "brainless desperadoes" of the male sex to perform crimes more violent than any of those yet committed, says the London *Standard*. Telegraph and telephone wires have been cut, and suffragets have been arrested in the act of defacing paintings in the Manchester Art Gallery, but such actions as these pale before attacks upon passenger trains, in which bombs have been placed in some instances. It is increasingly difficult for American women touring in England to "see the sights," for many places formerly open to the public are now closed as a precaution.

Two women were caught in the act of firing the new grandstand on the Kelso racecourse in Scotland, April 5. The same morning a grandstand at Ayr was destroyed by female incendiaries. Special patrols of police guard historic buildings in England, and those who own fine old estates like Chatsworth and Blenheim have set their gamekeepers the task of protecting their castles against any attack by what the British press now terms "wild women." Human life is no longer sacred to the agitators, it is said.

The Hunger Strike, and After

On Monday it was stated that the condition of Mrs. Pankhurst, who has refused nourishment since her trial, was serious enough to presage an early release. Her physique can not endure prolonged forcible feeding. Deportation is urged by Lord Robert Cecil as the best method of dealing with militants. Lord Robert is a Unionist, and an advocate of the extension of the suffrage to women. One of the London newspapers expresses the view of a very large body of the public as follows:

> The proportion of working people in the movement is infinitesimal. Most of the resolute opponents of militantism are workingmen and their wives. It is the most narrow, artificial and undemocratic movement that ever claimed the serious attention of the public of this country. The agitation rests no more on a solid foundation than skilful booming and clever advertising. Dry up its financial resources and make its members amenable to the common law and in a month nothing would be heard of the militant suffragist movement.

One of the suffragets now serving a two months' sentence in Holloway Jail is Zelie Emerson, a former resident of Detroit. Her offense was window smashing. Agitation in her behalf has extended to cablegrams of appeal addressed to Mr. Roosevelt and Secretary of State Bryan, who is having the case investigated. There is little likelihood of American interference, especially as the British Home Secretary has commuted the sentence by ten days. British militants are angry that Mrs. Emerson should have accepted this commutation of her daughter's term and exprest satisfaction.

On April 2 the House of Commons passed

on its second reading the bill of Home Secretary McKenna ("The Cat and Mouse Bill") providing that hunger strikers released from prison because of their physical condition may be rearrested and compelled to serve out their sentences. Mr. McKenna told the House that the hunger-strikers alternately shocked the public by violent outrages and addressed themselves to the public's sympathy by tales of suffering. They had declared war on society and law and order, he continued, and all this was but a part of their attempt to array the public against the officers of the law. Mr. McKenna urged members not to attach great importance to the women's reports of cruelty.

More than $100,000 has been subscribed to the National League for Opposing Woman Suffrage. N. M. Rothschild's name appears on the list of patrons ($15,000) and so does W. W. Astor's ($5000). Lord Curzon and Lord Rosebery have given $500 each.

The Adventures of a German Balloon

A newspaper of Reims, France, startled its readers with an April 1 joke, announcing that a Zeppelin balloon, having sailed over the French frontier from Germany, and cruised over the forts at Toul and Verdun, had lost both propellers and come to earth near the Reims barracks. Many persons hastened to the scene, where they exploded with wrath on discovering themselves the victims of a hoax.

Two days later the event facetiously reported did actually occur. A Zeppelin that had left Friedrichshafen, on Lake Constance, at 6.30 in the morning landed at noon on the parade ground at Lunéville, a town southeast of Toul, and near Nancy. French riflemen were drilling on the parade ground at the time, and seized the great balloon after the descent had been made. Captain Giund, senior of the four German officers aboard, explained to the French commander, Brigadier-General Lescot, that the landing had been made because of a defect in the motor. His pilot had lost his way in the clouds, after rising to a hight of almost 10,000 feet, and, with the officers, was ignorant of having crossed the frontier. The Germans took the Frenchmen at drill for soldiers of the Kaiser, and mistook Lunéville for Saarburg in Lorraine. A search of the airship showed that the Germans were truthful in denying that any photographs had been taken of the French fortifications. It was the Zeppelin craft's trial air-voyage.

The French removed the magnetos from the balloon, to prevent it moving, but permitted the Germans to telephone home for hydrogen with which to reinflate. The ten Germans spent the night in the cabin of Zeppelin IV, which was surrounded by fifty French pickets, posted there ostensibly to prevent hostilities or impertinences on the part of natives of the town. On April 4 the hydrogen arrived by freight-train, and the foreigners were permitted to resume their flight but only after paying customs duties amounting to $2000. Three French military aeroplanes circled above the anchored "dirigible," while the crowd cheered enthusiastically. At 3 o'clock the balloon descended at Metz.

The humor of the incident is not wasted on Paris, but the Germans are humiliated, and the *Tägliche Rundschau* even urges that the four officers of the airship be court-martialled—as Marshal Bazaine was in France after he had surrendered Metz. The German press considers it to have been the duty of the officers to blow their craft up, with its passengers, rather than run the risk of letting France learn the secrets of their balloon's construction. It is not clear that the French took this advantage of their rivals: a police officer, not an aeronautical expert of the army, searched the balloon. And a despatch from Paris states that the episode "has done more to clear the air and improve the relations of France and Germany than any incident since the mutual decoration, five years ago, of the graves of French and German soldiers killed at Rezonville and Mars-le-Tour in 1870. The courteous attitude of the French military authorities makes a striking contrast to the outburst of six months ago of the Strasburg jingo *Post*, demanding that all French aviators flying near German fortresses should be fired at with rapid-fire guns." But it is reported elsewhere that full details of the Zeppelin's construction have reached Paris.

Many German "dirigible" balloons have been constructed, Count Zeppelin having established a factory at Friedrichshafen. Most of the output has, soon or late, come to grief. Thus full news of the wrecking of the Ersatz Zeppelin I, taken over by the German army in February, have only just reached America. This is the vessel said to have made a night trip over England last month. She was wrecked while anchored at Karlsruhe.

Military Aviation Abroad

The lavishness of German appropriations for military and naval aviation was noted in this department last week. Meantime the

French National Committee for Military Aviation has issued its report upon the results of the year's works. This organization was formed by private individuals who feared that the air service of the army had been neglected. They started a national subscription for the benefit of military aviation, and the proceeds have been used to increase the aeroplane fleet of France, train pilots, and establish a network of aeroplane landing stations thruout the country.

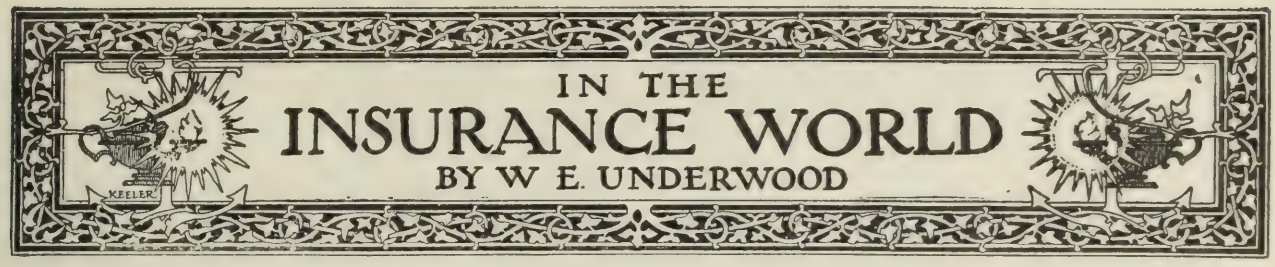
A sum of $800,000 was collected by the committee, which has already presented seventy-two aeroplanes to the army, and intends to present 100 more in the course of this year. Seventy thousand dollars have been devoted to the foundation of seventy-six aviation scholarships, and by June the committee will have furnished seventy-six trained airmen to the army The Minister of War has approved a scheme submitted by the committee for the establishment of thirty-two military aviation stations, chiefly on the eastern frontier, upon which the committee is spending $100,000. The sheds, constructed in accordance with the plans of the War Office, will be kept in repair by local subscriptions, and airmen will soon have a very complete network of stations for petrol and supplies.

The Minister of War has used $80,000 of the funds subscribed for the establishment of a chain of aviation stations between Paris and Lyons, Paris and Belfort, and Paris and Pau. But, not relying upon gifts, the French Cabinet will propose, when the Parliament convenes again on May 7, a bill to increase the French air-fleet. Tho the nation has 600 military aeroplanes, it is deficient in dirigible balloons capable of dropping explosives on battleships, arsenals, shipyards, etc.

The Daily Mail of London has offered a $50,000 prize for a trans-Atlantic flight by hydroplane, and several persons have announced their intention to compete. Among them are Gordon England, the British air man, Herr Rumpler, a German inventor, the Blériots, and Colonel Cody. Tho the *Mail* says that experts believe that the prize will be won before the end of 1914, American officers of the army and navy regard the competition as impracticable, so far as the present is concerned.

Montenegro Blockaded

A blockade of the Montenegrin seaport, Antivari, was established April 5, when eight European warships, representing Austria, Italy, Great Britain, Germany and France, formed in a semi-circle before the harbor. France and Great Britain seem to have acted reluctantly, for their sympathies are with Russia, and Russia's with the little mountain kingdom now subjected to coercion. After all, it is so far a mere demonstration on the part of the Powers, and subjects the Montenegrins to no hardship. Italy takes part in the blockade, notwithstanding the fact that Queen Helena is a daughter of the King of Montenegro.



The blockade follows the King's refusal to break off his attempt to take the Turkish fortress of Scutari. Nicholas asserts that possession of the fertile lands of the Zeta Valley is essential to his people, and "Scutari will be my capital," he declares. "For over three centuries the Turk occupied the best part of those dominions which belonged to our ancestors. The war has cost us $10,000,000 and 10,000 men; yet Austria tells us to stop when the reward of our sacrifice is at hand. We have done our part in liberating the Serbs and the Albanians; but we, too, desire life beyond our barren mountains."

A brigade of Austrian troops from Cattaro was reported on Sunday, the 6th, to be maneuvering near the Montenegrin boundary. Public feeling in Russia runs high, and on Sunday a crowd of 50,000 persons appeared before the Anitchkoff Palace in St. Petersburg, the residence of the Dowager Empress, singing the national anthem and displaying banners inscribed "Down with Austria!" "Scutari for the Montenegrins!" etc.

Peace Negotiations in the Near East

Turkey has accepted without reservations the terms recommended by the Powers as a basis of peace. Bulgaria's answer to the communication of the Powers dated March 22, a reply in which the other Balkan allies concur, is a qualified aceptance of mediation. The Powers will try to make sufficient concessions (at the expense of the Turks) to secure immediate peace, now proposing that the Thracian frontier be formed by a line drawn from Midia, on the Black Sea, to Enos, on the Ægean Sea, which would give Bulgaria both banks of the river Maritza, in accordance with her demands. It was also suggested that all financial questions, such as the indemnity, should be left to the decision of a technical commission to meet in Paris.

The Balkan allies insist upon the cession of the islands in the Ægean to themselves; Crete will be given to Greece; the allies reiterate their proposals concerning the Albanian frontiers, and their demand for an indemnity, the amount of which is left to further discussion.

Insurance by the State

There are two sorts of messages this department is particularly gratified to receive: those from people who agree with the opinions herein exprest; and those who disagree with them. Both are helpful. When we have done a good piece of work we like the encouragement which approbation brings with it; when our views run counter to a reader's, we are delighted to have him challenge them.

We are just in receipt of an interesting communication from Mr. J. G. Mills, general agent at Bloomington, Ill., of the National Life Insurance Company of Vermont, endorsing the sentiments exprest in our article of March 27, headed "Should Not Be Commercialized." Mr. Mills says:

" 'Should not be commercialized'—you are strictly and entirely right. Glad to note your free and consistent remarks.

"As you say, 'life insurance is a coöperative effort against the effects of the greatest human affliction; . . . all the participants are burden bearers; and therefore, the exploitation of the service as a maker of money by capitalists is distasteful.'

"The writer agrees with you absolutely and entirely as to the State going into the insurance business for the purpose of conferring on its citizens a larger good.

"So long as there is a trend toward the mutualization idea—and there is, becoming stronger and more pronounced each year—and with the strong mutual companies existing, it surely looks as tho the people are being served well and faithfully, without the State trying to better conditions as they now exist."

According to our method of reasoning, operation of the life insurance business by the State is fatally defective at two points: it fails to provide for the services of solicitors; and it can never be separated from party politics. Idealists prate about people voluntarily making application for insurance, but those of us who have carried a rate book know how absurd and impracticable is the idea. The post office life insurance scheme of Great Britain has been a failure for a generation. The people of Wisconsin have had the benefit of the thing for a year, and not a sufficient number of them have yet made application to enable it to commence work. State life insurance is possible, but not practicable. At any rate, not until we have become a bit more civilized.

A Harmony Dinner and Its Results

Of late there seems to have been discord among the liability insurance managers; not very serious, perhaps, but sufficient to spoil the music—a rift in the lute, as it were.

Just why they should make trouble for themselves when so many outsiders are doing that for them is not quite clear. Usually, in times of stress, kindred interests get closer together. It seems, however, to be the nature of insurance folk to segregate under the pressure of a common affliction somewhat on the principle of every man for himself and heaven help the hindmost.

As a business, employers' liability insurance is experiencing some difficulties just now. It is in a rapid state of transition. The necessity for its existence in its present form is evaporating. Workmen's compensation insurance is systematically supplanting it. When properly completed, and this will require a few years more, the change will be an improvement. The casualty companies, in an irregular sort of way, are endeavoring to guide the new dispensation in the right direction. By irregular we mean only that their efforts are not coördinated. They could get closer together on the work than they do. It is good work; its results will be practicable, and that is something that cannot be said of most of the raw legislative schemes proposed.

One evening last week the president of one of the leading casualty companies of New York City had the principal officials of competitive companies as guests at what is now called a harmony dinner, and every man present was bidden frankly to unburden his troubled soul. The invitation was freely accepted and a good old-fashioned experience meeting followed, during which it was found that the causes of disagreement were neither many nor serious. Next day came the regular meeting of the Workmen's Compensation and Service Bureau, the business affair, and the broad pinions of peace were over all. Like the old Greeks,

each man spoke winged words. There never was so much kindness and consideration in that council chamber before. All are now determined to have harmony if they have to fight for it.

Walker Bill Would Make Bad Law

The Walker bill now before the New York Legislature is ideal, and that is the principal reason it should never arrive at the dignity of being a law. Our civilization is too young, too commercial in its character, to make progress under it. There are many fine things if we could do them that would be better for us, but we can't do them. We are but flesh.

Under the provisions of the Walker bill fire insurance would be written in that correct and proper way understood only by those who have no knowledge or experience of the business. Those needing the protection would make written application for it every time, furnishing correct and complete information respecting all physical hazards, specific data relating to the actual value of the property to be insured, and such other facts as would enable the penetrating mind of the recipient of the application to locate a budding incendiary off-hand. The bill is one of the fruits of the recently discovered "arson trust."

As Mr. M. F. Westover, secretary of the General Electric Company, observes in a letter to Hon. James J. Walker, chairman of the Insurance Committee, the bill evidently is intended to reach a class of individuals or small business houses who burn property for the purpose of getting insurance money; "but," he adds, "in attempting to reach this class the bill puts a tremendous penalty upon all honest people and business houses in the State, probably more than 99 per cent of the whole." To practical business men interested in avoiding unnecessary expense, Mr. Westover's letter makes good reading, and we will quote briefly from it:

"The cost of making the applications required by the bill would be many millions of dollars a year, and in many cases it would be absolutely impossible to make them as provided. It seems to us that the result would be that very large amounts of property would go uninsured and that the cost of insuring property would inevitably be increased. This increase would fall on the honest property holder, who would therefore bear an unjust burden."

Mr. Westover asks a couple of pertinent questions:

"Moreover, is it likely that the bill will accomplish what is intended? Would not the man who would burn property make a false application?"

As an illustration of the impracticability of the measure, Mr. Westover says:

"As a concrete illustration please note what it would be necessary for this company to do. As to the reasonable value of this property we could only give an approximation except at inventory time, once a year. It would require great labor to state the amount of the insurance, names of insurers and policy numbers on a plant insured for many millions of dollars as at Schenectady."

He says in conclusion: "We hope that some way will be found to reach criminals without requiring the great body of property holders to do the impossible, or that which is vastly expensive and difficult."

If the gentlemen who conceived and formulated this bill understood the working side of the fire insurance business and its relations with property owners they would immediately perceive how impracticable, unnecessary and, from the point of cost, how absurd it is. They forget that the vast body—99 per cent is under rather than over the mark—of insurants are honest; and they also overlook the fact that the insurance companies defeat the dishonest minority more times than they are themselves defeated when they come to settle with them.

Notes

Hon. Willard Done has been reappointed Commissioner of Insurance of the State of Utah. This action is a deserved recognition of services heretofore rendered in that office.

Assemblyman Willard, of Cattaraugus, has introduced a valued policy bill in the New York Legislature. This vicious form of insurance legislation makes its appearance at every session.

Mr. Ralph K. Hubbard, for many years comptroller of the Provident Savings Life Assurance Society, which was reinsured in the Postal Life Insurance Company three years ago, has been elected general manager of the Toledo Life Insurance Company. Mr. Hubbard's acknowledged ability and ripe experience will prove to be of great value to the Toledo.

It is certain that the fire insurance companies have incurred heavy aggregate losses in the storm-swept Middle West under their tornado and fire contracts, but as yet no definite particulars are obtainable. The large agency companies will be but slightly affected, but it is presumed that the smaller local companies in Nebraska, Iowa, Indiana and Ohio have been hard hit.

Making Insanity Pay

We have to thank Mr. Kenyon Cox for this good phrase. He used it in his shamelessly intelligible comment upon cubist art. It applies as well to many other things besides pragmatic cubicity.

Could a better description of our twentieth century civilization be put into a three-word phrase? We are not sure. The editors of THE INDEPENDENT of 2013 will be more competent to judge. Pictures that look like craziness when you stand too near, sometimes become vulgarly comprehensible when you get far enough away. So our present day civilization may turn out to be something more than an exploitation of progressive dementia. We are optimistic enough to admit the possibility.

All that we can do now is to call to mind certain characteristic interests of our current life and try to say quite honestly whether, so far as one in daily contact with them can judge, they are really anything more than attempts to make insanity pay.

Would any one take serious exception to the following as a truthful list of the great "interests" which make up our American life? 1. The ticker; 2, female apparel; 3, baseball bulletin; 4, the "movies"; 5, bridge whist; 6, turkey trotting; 7, yellow journal headlines and "funny" pages; 8, the prize fight.

How many of our readers after due reflection would dispute the proposition that 100,000 Americans are genuinely interested in the foregoing matters, and day by day excited over them, to every 10,000 that are interested in religion beyond a perfunctory church attendance, to every 5,000 that are interested in polities beyond a little partisan campaign excitement, to every 1,000 that are interested in schools and education, to every 100 that are interested in reasonably good music or good opera, to every solitary individual who is interested in literature or science?

We would not insist upon the arithmetical accuracy of this sizing up of our esteemed compatriots and fellow sovereigns, but neither do we doubt that most of them will joyfully concede that we have not greatly misrepresented them.

Half or more of these great "interests" have basis in the legitimate satisfaction of normal human wants. But every one of them can become an obsession, and in America every one of them is an obsession. Men and women and children, too, in multitudes, in droves, are "gone" on them, and this slang word, so accurately descriptive, is the multitude's own indictment of itself. Culture and beauty are scored, knowledge is sniffed at, obligation is forgotten, work is neglected in the feverish following of the "quotation" or the "score" in the senseless slavery to "mode," in the surrender to sensual pleasure.

And why? Is this wretched folly and madness the best exhibition we can make of ourselves? Is the American mind inherently inane, or hopelessly inadequate? Is it by heredity given over to drivel? We are not ready to think so. Rather, we believe, the American is suggestible, easily excited, and credulous. He is not feeble-minded; on the contrary,

he is perilously near insanity, as his shocking history of lawless emotionalism, freak religion-making, lynching, and homicidal habit too well proves. And upon this suggestibility and gullibility well organized, wholly cold-blooded and unscrupulous enterprise plays—for profit!

Here, we suspect, is the true secret of our amazing civilization. The trick of making insanity pay has been mastered. Untold millions of capital are invested in it. Men of great ability devote all their talents to it. The ticker, the mode, the bulletin, the moving picture perverted, the headline, the appeal to sensual appetite. These are the means, the instruments. Back of them is the carefully calculated investment, the exactly measured expenditure of energy, time and publicity work. The multitude responds, and accepts excitement in full payment for wisdom, health, sanity, knowledge, happiness.

All in all, making insanity pay is probably our most characteristic American business enterprise.

Revision of the Tariff

Warrant for many of the reductions made in the pending Underwood tariff bill can be found in the records of our foreign trade, which show that our exports, which were only $824,000,000 in 1895, and which crossed the billion mark for the first time in 1896, were $2,399,995,973 in 1912.

Manufactured goods are now a great part of these exports. We have been selling manufactures of iron and steel to foreign buyers at the rate of $1,000,000 a day. A manufacturing industry that can sell its products freely abroad in competition with the similar products of other lands does not need to have its home market protected. If it can undersell foreign manufacturers abroad, surely it can undersell them at home, where the foreigner is handicapped by ocean transportation charges.

If an industry here has been built up by means of protective rates until it is independent, selling largely abroad, this may be used in defense of the protective policy, but the same industry's present condition is proof that protection is no longer required. A duty for which there is no legitimate excuse tempts producers to make it a tax upon domestic consumers by means of combination. Everybody knows that in some industries which have outgrown protection there have been combination agreements, the effect of which was that American consumers were forced to pay a high ring price, while the manufacturers were selling at much lower prices to buyers in foreign countries.

President Garfield said he was for protection that led to free trade, meaning that he desired such protection as would build up a home industry until it could stand alone, defying foreign competition, exporting its products and no longer needing a protective duty. The tin plate industry is an example. It was created in this country a little more than twenty years ago by a tariff duty. No tin plate had been made here. We consumed great quantities, and bought our supplies from Wales. Under the shelter of the duty, the industry here was born. It grew rapidly, and at the present time it not only satisfies the American demand, but also sells much tin plate in foreign countries. Its condition furnishes proof that it no longer needs tariff defense.

In the Underwood bill, the duty on tin plate is largely reduced. Altho, as we have said, a protective rate is no longer required, the product should not be put on the free list if the materials used are still to be dutiable, for such legislation might, and probably would, put the domestic manufacturer at a disadvantage.

In framing the bill several errors of this kind have been made. For example, a duty on wheat is retained, while wheat flour and other finished products of which wheat is the base are made free. Beef is placed on the free list, but there is to be a duty on cattle. Steel rails are to be free, with certain other finished products of steel, but there is to be a duty on pig iron. We suppose that rails are put on the free list because of evidence that while a uniform price has been exacted at home, sales at lower prices have been made to foreign

buyers. As a rule, finished products should not be put on the free list if the raw materials continue to be dutiable.

Those parts of the bill as to which there is sharp controversy are the removal of the duty on raw wool and the reduction of the rate on sugar, with a provision that all the sugar duty shall be removed three years hence. In the public interest, the duty on wool should be repealed. As a protective device, it has been a failure. It has not developed an industry large enough to supply the domestic demand, but the number of sheep has been decreasing. By the repeal of it, and by an accompanying large reduction of the duties on woolen goods, the cost of woolen clothing will be reduced and thus the public welfare will be promoted.

It is not so clear that sugar should be put on the free list now or three years hence. Some think that the cost of sugar to consumers would be sharply cut, and that this would compensate for the loss of $50,000,000 of revenue. It appears to be admitted by the leading supporters of the bill that without a duty the cane sugar industry of Louisiana would die, and that the beet sugar industry in the West would at least be greatly depressed. Hawaii, Porto Rico and the Philippines would lose the advantage they now enjoy. Already they are complaining. It is predicted by some who are familiar with the industry that the changes caused by free-listing this produce would tend so to affect the price that consumers would perceive but little gain, if any. The question is one that deserves careful consideration in Washington.

It is noticeable that the provisions of the bill have not thus far caused apprehension and disturbance in the country. We earnestly hope that no disturbance or general loss will follow the enactment of them. The revision of a complicated tariff system like our own should be made with the aid of the recommendations or reports of a competent nonpartisan commission. Especially is the assistance of unbiased experts needed when, as at present, a very long step is to be taken toward abandonment of a policy which has been in force for half a century.

The Seventeenth Amendment

Amendments to the Constitution are coming easily of late. Because it had been nearly fifty years since a new amendment had been added we began to think it was a very difficult process to create one. Now we find that we can do it easily enough if we really need one. It was only the other day that we were surprised with the amendment which allowed the Federal Government to enact an income tax law, and now, before we know it, the Seventeenth Amendment is approved by three-fourths of the State legislatures, allowing the election of United States Senators by popular vote. The reason why we had no amendments since 1865 was because we did not feel the need of any. As soon as the people felt the need of one it came—indeed, two came all at once.

This shows how uncalled for was the cry but a few months ago for the power to override the constitution of the several States whenever the decision of the courts that an act is unconstitutional excites criticism. We might as well have no constitution as have one which can be annulled piecemeal. A constitution has the merit and use that it protects the minority, and that it prevents hasty and unconsidered legislation. We shall probably hear less for the next decade or two of the danger that a constitution will hamper the popular will. Little has been said in favor of the power to override the Federal Constitution, but if it is found easy to amend the national Constitution, it is easier still to amend a State constitution.

The new amendment we have favored. It is in the line of absolute democracy. It trusts the people, even the ignorant. But why have any ignorant? Or if we must have ignorant, the intelligent can, if knowledge is power, direct and control the ignorant. The one thing that gives occasion for concern in this amendment is, that it appears to indicate a distrust in the honesty of elected legislators. It raises the question whether representative government can be trusted not to break down. The people do not like it that the election of a Senator, as lately in Illinois, can be held up month after month, and the election take place

finally with charges of bribery, when the people could elect in a day.

An American Pope?

The possibility of an American ascending the chair of Peter is not unthinkable. It is in the mind of American Catholics. It may not then be too far afield if we consider the American Cardinals and their papal attainments.

Of the College of Cardinals, four are American citizens, of whom two are naturalized—Falconio and Farley; and two natives—Gibbons and O'Connell. We may dismiss Falconio with a mere word. He was naturalized when he was a plain Franciscan friar without any prospect of advancement. Should he have the good luck to be named to one of the suburban sees of Rome or to any other important see in Italy, he will take the oath of allegiance to the House of Savoy under pain of losing the diocesan revenues, which no bishop in Italy can handle without the authority of the Italian Government.

Of the other three, O'Connell of Boston is the youngest and perhaps the most influential in Rome. In his favor is a tremendous energy and an untiring capacity for work. He has completely made over his diocese; not, however, *suaviter in modo*, altho *fortiter in re*. As a result he has stirred up much enmity, especially among the older clergy, whose revenues he split up by creating new parishes within the ancient parochial bailiwicks. To be an autocrat in Boston, and that over a body of Irish clergy, is a fairly easy matter. They are not rebels. Such autocracy would be very distasteful in Rome.

Going over the Pontiffs who sat on the papal throne, the figures of Hildebrand and Julian II seem to us the nearest to the stripe of man that is O'Connell. Julian perhaps more so, as his greatest glory lay in wielding the shillelagh. At the same time we must not suppose that His Eminence of Boston is unskilled in the smoother ways which gain success in State and Church. Perhaps we do a wrong to those two pre-Reformation Popes. Cæsar Borgia would furnish a more congenial type. Machiavelli has left the rules of government which guided Cæsar. They might answer for Boston's head. Sinister reports attended his elevation to the mitre, the metropolitanship and the red hat. Still, he would make a much better Pope than most of his Italian confreres. No doubt the youth of O'Connell will be against him, for he is not much over fifty.

Farley of New York would make a good, peaceable Pope, just such an one as would please the Jesuits, the Pretorian Guard of the Church. To govern the diocese of New York is no easy matter, but so far the Cardinal has gone along smoothly enough. His boldest deed, viz., the removal of Dr. Driscoll from the presidency of the Dunwoodie Seminary, was made easy by the quiet surrender of the victim.

As Pope, Farley should be called Pius XI. He would be as amenable to the policy of the *frate* as were the other two Popes of that name, Pius IX and Pius X. He would adorn the chair of Peter with two virtues not always surrounding it, viz., correct life and no nepotism. Farley is hardly in the running, altho, like O'Connell, he studied in Rome and knows Italian.

In the popular mind stands first Cardinal Gibbons. For over a quarter of a century he has worn the red hat and has been the central figure in affairs ecclesiastical and also other sorts. In his favor as a papal aspirant are his age and his well-known liberalism. From Rome we learn that the leading candidates are De Laï and Rampolla. The former is a mere routine drudge, who rose to his present prominence without any experience save curial. This narrowness makes him all the more acceptable to the powers that be on the Tiber. An obstacle to De Laï's ambition will be that he is of the school of the present Pope and too close to Del Val. As is pretty clearly seen in the history of the Papacy, the pendulum swings the other way on the death of a Pope. Such a turn would mar the chances of De Laï, who, however, has the reputation of being a complaisant sort of intriguer. He may secure the prize because he is considered somewhat harmless. For this reason, he reminds us of Leo XII.

The change to more liberal views will give his chance to Rampolla. Of course it will be always against him that he

once tried and lost. The Austrian veto still hangs like the sword of Damocles over his head. The result may be that neither of the two may have enough votes to carry the day and yet each enough to keep the other out. In such a crisis or in a similar, for after all those two might be shelved, lies the hope of Gibbons. The liberalism of the Cardinal of Baltimore, coupled with his age, would show him an excellent compromise. His seventy-nine years are a sign that he can not last very much longer and would before long yield the place to some other; his liberalism would accord with the swing away from the reactionism of Pius X. If Pope, Gibbons would not cease to be an American. He would prove a gentle, altho firm, ruler. The tiara would be worn by one who is entirely detached from money. As priest, pastor vicar-apostolic, bishop, archbishop, and as Cardinal, Gibbons never worshiped the golden calf. Again, he is no nepotist. As Pope, he would not be ashamed to ask the views of others and that frankly, with intent to profit from them. He is prudent, perhaps too much so; but at the same time his weather eye is ever on the political vane. Some fifteen years ago, at the time of the Wilmington (N. C.) massacres, he came out against negro suffrage and so pleased the folks south of Mason and Dixon's line. Today he opposes votes for women, whom he is fond of telling to stay at home and look after it.

Lares and Penates for females; Jove and Neptune for men.

Finally he has come out against Home Rule for the Filipinos; this in all likelihood *jussu Superiorum.*

As Pope, Gibbons might be more like Pius VII, who had to deal with Napoleon. That vacillating pontiff, Consalvi helping, crawled out of some desperate corners where a stronger man would have failed. Gibbons is pretty good at diplomacy. In the conclave in which Leo XIII was elected, Manning, it is said, had one vote. Let us hope that His Eminence of Baltimore will do better in the forthcoming one, which the critical state of the health of Pius X seems to forfend as soon at hand.

In conclusion, there is little chance that an American will be chosen, or any other non-Italian.

The sons of Sunny Italy know how to hold a good thing. Such is the Papacy. It is, however, a noteworthy fact of history that in the next conclave three Americans will have the right to sit and vote. We pass over Falconio, who was among us but not of us.

Surrounded by men from the various governments of Europe, our fellow citizens, while ecclesiastically in favor and rightfully present, will still be citizens of a country whose form of government has been and still is formally condemned by the Church of Rome. The Papal Senate will see three political traitors among them. But what is the Constitution among friends?

Back to the Jungle

We Americans naturally take pride in the successful construction of the Panama Canal, but we take still more pride in making the Canal Zone habitable, for this is a greater triumph over natural difficulties than the other. Nobody doubted that given money and time enough, a canal could be put thru, but it was very generally questioned whether it was possible for white men to do hard work and preserve health in the tropics. The digging of the ditch and the casting of the locks at Panama is after all an engineering feat like the excavation of the subway and the building of a skyscraper in New York, but to turn the pesthole of the world into a civilized community where men, women and children from the United States can maintain the same standards of life as at home, this is an achievement unique in history and promises more for the future than the Canal itself.

And now we are told that all this is to be abandoned in a few years and this strip of Americanism allowed to lapse into the wilderness it was four hundred years before, when Balboa first forced his way across the Isthmus. Colonel Goethals, in his speech at the Harvard Commencement of 1912, said: "God never intended the white man to live in the tropics or he would have put him there in the first place." Such medieval

language sounds strange coming from a man who has effected such a transformation of natural conditions. It is not above the level of Philip II of Spain, who decreed death to any one attempting to dig a canal across the Isthmus, on the ground that it was impious thus to undo the work of the Creator. We might imagine that the bigoted monarch thought the injunction, "What God hath joined let not man put asunder," applied to continents as well as to married couples. Colonel Goethals, tho he manifestly does not fear the wrath of God by severing the Isthmus, yet apparently believes that the Almighty has set the Tropic of Cancer as a permanent bound to the habitation of the white man. For our part, we believe in a God of civilization who favors the town rather than the jungle, and man rather than the beast.

It is also urged that it would cost too much to maintain the sanitation of the people living upon the Canal Zone after the construction work is over. Here Colonel Goethals apparently comes into conflict with Colonel Gorgas. According to the figures of the latter, the expense of protecting a community from tropical diseases is not prohibitive. Four cents a day per person, we believe, is the estimate, leaving out the expense of hospital treatment for those who are sick or injured.

There are many other reasons alleged for the depopulation of the Canal Zone, such as the poorness of the soil, the insects and the wet weather, but obviously the real motive is military expediency. The Canal is being fortified. A garrison of 25,000 men is to be kept there if Colonel Goethals has his way. The annual expenditure for defense will run into millions. One of the arguments for the Canal was that it would enable one navy to police both oceans. Now we are told that the navy must be doubled to maintain control of the Canal, a necessary link in our chain of coast defenses.

It is a question whether the Canal would be any better protected in the midst of a wilderness patrolled by soldiers than in the midst of a community of American towns and farms such as would grow up here as naturally as a village at a crossroads. This is indeed a crossroads site unequaled in the world; for all of the traffic between the Atlantic and Pacific *by water* must pass thru Panama. And all of the traffic between North and South America *by land* must pass thru Panama. No doubt many times the present population of 60,000 could find support in this commerce and make homes along the Canal and on the shores of the great freshwater harbor at Gatun.

But all this commercial advantage must be lost to us because it has been decided not to make the Canal a neutral highway, as was formerly proposed. It is merely another sacrifice to Moloch.

Rebellion Against the Marriage Service

Some people seem to think there is something sacred about their special marriage service, and that it must not be disturbed. Such are those in England, and some in America, who are shocked because a company of Englishwomen have made a protest against the archaisms of the Anglican service. It is no more sacred today than it was when a change long ago eliminated the promise of the wife to be "buxom" to her husband at bed and board. If marriage is a sacrament, or anything like it, that sacramental character does not attach to the language by which each party vows to be faithful and loving to the other.

These critics in England have gone beyond bounds in their fault-finding, but there is enough to find fault with, particularly the promise of the bride to "obey and serve" her husband. No woman had part in drawing up that formula, and yet many a woman insists on being married by it, just because she thinks it is old and fashionable and picturesque, altho she has no intention of being bound by it. Less objectionable, but equally false, are the words that accompany the ring, "with all my worldly goods I thee endow." In these days the impecunious man seeks a wife who can rather endow him. She, not he, brings the *dot*. But it is superfluous to specify the infelicities and inequalities of the English service, which have led all Churches, except those bound by laws of their own making, to modify it or change it altogether. We mention a

single one, "Who giveth this woman to be married to this man?" a plain reminder and remainder of the days when a woman could be given away by her father or her brothers as so much property.

Dr. Sun's Coming Visit

While Dr. Sun Yat-sen, the first provisional President of China, was unable to make the visit to this country last year which he desired, he has announced, in an interview in Kobe, Japan, his plan of coming here during this year. We presume that the visit will have relation to his great task, imposed upon him by President Yuan Shih-kai, of developing in China an extensive railroad system.

Another statement attributed to him in the same journal is really startling:

"I don't consider that Russia really wants a desert like Mongolia. My opinion is that Russia is after India; and I don't think England is strong enough to restrict her, should the time ever come when she attempts to take it."

But Russia is taking Mongolia, and Mongolia is not all desert. Nor is Mongolia on the shortest or easiest route to India. At present there appears to be a full understanding between Great Britain and Russia, as shown in the division of Persia into spheres of influence, and the British pressure on Tibet while Russia puts her foot down in Mongolia. At present China cannot prevent aggression by either Great Britain or Russia, and both countries will have to hasten their plans before China gets strong enough to make resistance.

The Garden

Some days ago the bluebirds flew northward, high up in the thin and frosty air, whistling everywhere to the farmers as they flew, "It is time to make garden"; and the farmers looking upward, looked also downward, to see that the streams were rapidly carrying the snow-banks off the fields and into the creeks. April taps on the ground, calling on the dandelions to wake up, and the garden "greens" to get ready for the housewives. It is time once more to strike the spade into mellowing soil, and soon we shall be ready to sow the early peas and plant the early potatoes.

Who can think of green corn on the ear and Telephone peas and Swiss chard and delicious golden carrots without a desire to hurry up dear old Mother Nature, asking her to spare us a few of these tedious days, when spring and winter get badly mixt. Once a year we come round and round again to that strange novelty of emotions which are wrapt in the word *garden;* the one word that constantly counts up in poems of strawberries and tulips, of berries and flowers. The orchards full of plum and apple blossoms, and the corn fields, and the meadows full of June hay, will come by and by, but just now the whole world is realized in the little old-fashioned garden.

Spreading this garden out to cover acres, to be cultivated by horse-power, meanwhile removing all the fences, this has not added to the charm. What we want is that little enclosure, not too far from the kitchen, where under mother's special dispensation, we grew the delicacies of the dining room. One must not forget the beauties of common things. It is true we feed carrots to horses, but there are few things more beautiful in foliage than this homeful vegetable. Its leaves alone are invaluable for embroidering platters of pansies, or embracing nasturtiums. Delicate, bountiful above ground, it is the very gold of vegetables below, the orange of the garden, cleanser of the blood, nourishing and delicious. One might write with almost as much enthusiasm of the delicate chard, of the young onions, the crimson beets, and then of the herbs that accompany the wise cook's skill.

The well-made garden never permits the practical to dispense with the beautiful, nor in fact is this possible anywhere in nature. We would never have a garden without nasturtiums, even if pickles were never heard of; and then along the border, where the brook is trained to trail the loosened leaves, and ship them down to the meadow, there we would have the watercress and the blue-eyed forget-me-not running hand in hand.

We have always held a garden to be a part of the intellectual and educational

furnishing of a country home. We need a shop for hand tools, but a garden for hoes and spades. With about one-third of the boys and probably as many girls the garden has the advantage, while the shop, with its chisels and planes and saws, captivates rather a larger part of the boys. Those who prefer the garden inherit probably a fondness for Nature, including not only the vegetables and trees, but the butterflies and the bees. This early taste is too often worn out in our public schools, and with the boys at least, growing flowers and weeding onions gets to be despised.

Garden experience has this immense advantage, that it cultivates taste, leads to experimental work and investigation, and finally develops creative skill. This will surely give the child a wider view of things from that obtained where the youngster is left to himself, to grow his own enthusiasms. He should surely have a personal ownership in the garden; really owning more or less of the products; initiating his own plans and choosing his own seed.

It is difficult to tell why, but so it is that if you give gardening over to the father, you will find an abundance of hollyhocks for flowers, and the bed of turnips will be well bordered with parsnips; but where the mother's hand has sway the pinks will have their way abundantly. There will be mustard for greens, not always crowding hard on dandelions, and there will be green peas to shell, and the sweet corn will be dominant. Turn your garden over now to the boy, and he will whistle his way where there is little weeding to do, and he will show you what the hoe can do while the boy stands plumb upright.

Girls like pansies; this is a lasting law of girl nature, and if you give them a directive hand anywhere in the garden, you will find these modern Johnny-jump-ups plentiful. Let the girl have a chance to thrust tulips down into the borders, and into the strawberry rows. It is amazing how many girls are natural gardeners. Give them half a chance, and they will combine the useful and the beautiful to a dot. The girl likes a talkative flower like the pansy, but the old man likes better the flower that feeds the bees, and the vegetables that suggest comfortable cows and happy horses. However, be sure that you do not omit, whatever else is left out, the old-fashioned and yet the wonderfully improved nasturtium. We rather dislike that word *improved* in the garden; we would like to see one of the old-style gardens, and determine whether it really is improvement that has gone on. This nasturtium is something wonderful even in the floriferous world. Grown on the poorest soil, it tumbles into such profusion of bloom, with such amazing rapidity, that it covers every inch of space that it can get, and then it challenges you to pluck as many flowers as you please, defying you to reduce the number, all the spring, and all the summer, and all the autumn —that is the nasturtium. Specially wholesome for the sickroom, delicious on the dining table, never tiresome or tedious anywhere, because of its ozone-emitting flowers.

The editor expresses his weakness for string beans. Then he would have bordering the beans a few roots of the old-fashioned grass-pinks. He would not have one thing in the garden that would make him get down on his knees, unless it be to thank God for a garden. In the right climate he would have a few hills of muskmelons; and the sharpest strokes of his hoe should be to eliminate any coarser flowers, like zinnias; only in their places there should be the magnificent sunflowers—plenty of them, enough for the garden and enough for the big vase that stands in the corner of the dining room. He would associate health with growth, and growth with health.

But the GARDEN belongs to all; it is the school-room of the family; the art gallery, where the worms that plow and the birds that sing are equally at home. Here the bees grow the sweets into honey, and the heart of daily care is brightened by its products. By all means make a garden; sow the seeds that blossom into God's good will; say the prayer of trust as Jesus said it, Thy will be done on earth—and in the earth also.

It really is spring! Gardening has begun! and the brooks are running thru the soil, to gather up the superfluous water, and carry it down into the valley. Already the strawberries are opening here and there a blossom, and the poplar

odor comes in from the forest edges. Arbutus and anemones entrance our trampings woodward; but we turn again to leap the brook homeward, and our steps are hastened to find what seeds are already sprouting in our garden.

A Living Wage for Women

"It is the low wages, not enough to live on," says one social reformer, "that makes young women in shops and department stores go wrong." That is denied by their employers, as repeated in the Chicago investigation of vice conditions. They declare that decent, self-respecting girls can live on the low wages, say four or five dollars a week for the youngest ones living at home, and eight or ten dollars for those who live by themselves. They assure us that those go wrong who want to go wrong, who are inclined that way, and whose environment tempts them to go astray. Which is true?

We believe that both statements are true. The great majority of young women thus employed on scanty wages are virtuous and good. They deserve great respect. Their pure nature revolts at wrong, and their struggle is often heroic. They look forward to honorable marriage, and they hold themselves above coarse temptation. But all are not such. Some are weak and do not strongly resist temptation. They cannot on the wages they receive get the clothes or the food they want and really need. They too easily accept attentions and favors from designing men and they fall victims. Some would yield even with more than the minimum wage, but want will and does make not a few weaker ones yield who would hold the straight path if not so crowded out of it by hunger and cold.

Now, it is these weaker ones that ought to be protected by a law which requires that there be paid them a living wage. By a living wage is meant one which will allow a young woman to rent a small heated room and pay for sufficient nourishing food, purchase decent clothes, and have a little over, not much, for candy and other pleasures. If she is a child she should be living at home, protected there, and will receive a smaller wage; but as she grows to be a young woman, in a multitude of cases wholly self-supporting, she will need and should receive wages not below a fixt level, surely not less than eight dollars, probably not less than ten. Certainly the wages should be such that want shall not drive the weak-willed astray.

But can the stores and factories afford to pay such wages? In a large establishment this might cost $100,000 or $200,000 more a year; but these establishments make a profit of a million and more a year. It is better to make less profit and save more girls from ruin. They can afford it; the testimony at Chicago proved it. We have no fear for them, for they are quite as likely to make the increased wages an occasion for enhanced prices and larger profits. The big concerns do not need protection; it is the unprotected, the human beings, brave, suffering, sometimes weak, trustful, living hardly and much tempted, for whom society and the law should care.

We know well enough that it is men that have led astray the victims of the traffic in vice. We know it is these men who most deserve shame and punishment. We know that in most cases the women who fall—not all of them—are those who least care to resist temptation. But the law should not allow them to be put into conditions of employment where it is made difficult for them to resist. Such is one reason for a minimum wage law for women.

Politics Out of Place

Everybody knows that in diplomacy there should be no politics. Politics is national; diplomacy is international. Other nations do not change ministers and ambassadors whenever there is a change of cabinet. The United States does this most unwisely. If a diplomatic agent makes good he should be kept in service for the good of the service. If he does poor service he should be dropt from service for the good of the service, but not to make a berth for some one who has helped the new President to get his election.

Equally is this true of administrative officers at home, with few exceptions. We understand this as to many minor

positions, and President Taft wished to extend the rule not only to fourth class post offices, but to the position of heads of the larger offices. Of course, certain changes must be made, notably that of the President's Cabinet. But why should the Collector of the Port of New York, who has done his work most admirably, be removed to make room for a man of the President's party? A dinner was given last Thursday evening in honor of Collector Loeb, and Democrats like Mayor Gaynor joined in the highest praise to the impartiality and efficiency with which he had discharged the duties of his office. But he had to go just the same, because he was a Republican, and the office and salary were wanted for a Democrat. Yet a Democrat and a Republican ought to perform the duties of the office in precisely the same way. There is no kind of reason why Mr. Loeb should be removed, except the old reason of the spoils of office. Mr. Loeb in his address at the dinner said that the position he had held as private secretary to the President was one that gave unusual opportunity to get a good knowledge of our governmental system and its personnel. He added:

> I had observed that the Collectorship had been regarded as political leadership, and while the Collector played politics, a part of the public played horse with the revenue. The grafters in the service made hay while the sun shone, and the real business of the office was carried on by subordinates. I determined on a radical change—

And a radical change he made. We hope that under a Democratic Collector there will be no reversion to the bad old way.

Here is the case of a Collector of Internal Revenue in Florida, Joseph E. Lee. He was formerly State Senator and handles $1,000,000 yearly. He has held the office for many years, and his record in Washington is blameless. He is a graduate of Oberlin College, and no fault can be found with his efficiency or his character. But the Florida Senators and Representatives have long been trying to get rid of him and now they feel sure to succeed, for what is the use of being Democrats and getting a Democratic President if they can't get rid of a negro Collector? It is intolerable that white Democrats should be compelled to make payments to a colored man. So he must go, and probably will go, however good his record, and white Florida will rejoice. One of these days we shall learn the alphabet of governmental administration.

In Brief

The President of China, who will be formally re-elected this week, has his sons educated in a Christian missionary institution. Dr. Sun, the first provisional President, has a son now studying in Berkeley, Cal. Dr. Sun reports that he has been successful in assuring cordial relations with China in his visit to Japan, and that the new Japanese Cabinet does not desire to exploit China for its own advantage, and that a satisfactory treaty between the two Powers is likely to be made.

A Cuban law forbids duelling; and yet two Cubans of high position lately fought a duel and were favored with four seconds of political and social standing, and one of the combatants was shot dead by his more skilled adversary. The friends of the dead man say it was murder, but one of the seconds declares in a public statement that "nothing could have been more correct or gentlemanly." Such a duel ought to end the duello in Cuba.

We are told that forcible feeding broke the nose of Miss Emerson, the American suffraget convicted of crime and sent to an English prison. But if it was broken it must have been because of her resistance. It was her own fault if she broke the law; her own fault if she went on the hunger strike, her own fault if she resisted being fed, and very little sympathy is due to her.

It is now eight times that the attempt has been made to assassinate King Alfonzo of Spain, and in not one case has he been injured. He seems to bear a charmed life. The attacks are charged to anarchists, and it would seem that they are resolved to kill him in revenge for his refusal to save the life of the condemned anarchist teacher Ferrer, of Barcelona.

We wish that all other dailies would follow the example of the Philadelphia *Public Ledger*, which announces that it will discontinue the color comic supplement to its Sunday edition, because it believes it pernicious to boys and girls, altho such a supplement is supposed to have a large circulation value. American "comics" are demoralizing to taste as well as to character.

Our Canadian Border Problem

Arbitrating the Tangled Water-Rights Where the River Systems of a Continent Come Together

By James A. Tawney

[Hon. James A. Tawney, after serving in Congress from 1893 to 1911 as the representative of a Minnesota district, was appointed by President Taft to the International Joint Commission whose work in settling water boundary questions is here described. Mr. Tawney is chairman of the commission.—EDITOR.]

It was up the St. Lawrence and thru the Great Lakes the Jesuit priests carried the cross as the emblem of peace to the warlike Indians who held the heart of the American continent two hundred years ago. The civilization of Europe and the East made its way to the Mississippi Valley along this same great water line, and today it is the route along which pours the natural wealth of the great Northwest to feed Europe. It has become the busiest, the most utilized water route in all the world, with more tonnage than that combined of the ports of New York, London, Liverpool and Hamburg; more people living along its shores than on the shores of the Baltic Sea; more people sailing on its waters than can be found on the Mediterranean and thru the Suez Canal. There is a greater and richer tributary country than borders any other like body of water in all the world. This most important water route in America is international; used in common by two great nations, and it has come to be the first cause for the creation of an international joint commission to find judicial adjustment for old and new differences between the United States and Canada and between the inhabitants of each country who live along the international boundary. The new method and machinery provided by such a commission are apparently necessary, because this water boundary is the most important east and west waterway on the continent; it is the most effective means of regulating the freight charges on the great transcontinental railway lines on both sides of the boundary; it is the source of the greatest waterpower in all America, as well as of the greatest water transportation in the world, excepting alone the Atlantic Ocean; it is the basin into which is poured the drainage of a large population in the two countries, and it presents more complex problems than any other waterway in the world.

Had the peace commissioners who drew the treaty of 1782 fixing the boundary between British and American territory sought to split the difference on the most valuable part of the continent, they could not have succeeded better than they did by running a hit or miss line to the westward along the only known water route east and west and thru a country of which neither Englishmen nor Americans had any knowledge; for it had from the earliest discoveries down almost to the time of the Revolution been known as New France on the maps of North America and was peopled only by Indians with a few scattered French settlements and forts. It is said that Ben Franklin was the only member of the peace commission who paid any attention to an international boundary extending beyond the Alleghany Mountains. The war had been along the Atlantic slope and the negotiations for peace were confined to the questions growing out of that war. A majority of the peace commissioners did not think it necessary to define an international line thru the Western wilderness, until the old printer-philosopher Franklin insisted that it would be well to extend the line between British and American possessions beyond the Alleghany Mountains and as far west as the Mississippi to avoid future differences.

In little more than one hundred years the whole Northwest has been settled, the haunts of Hiawatha have become the pleasure grounds of white men and women, and the great international water line has become the most popular excursion route on the continent. More than that, the territory on both sides of the boundary has become the home of most enterprising people, who realize better than

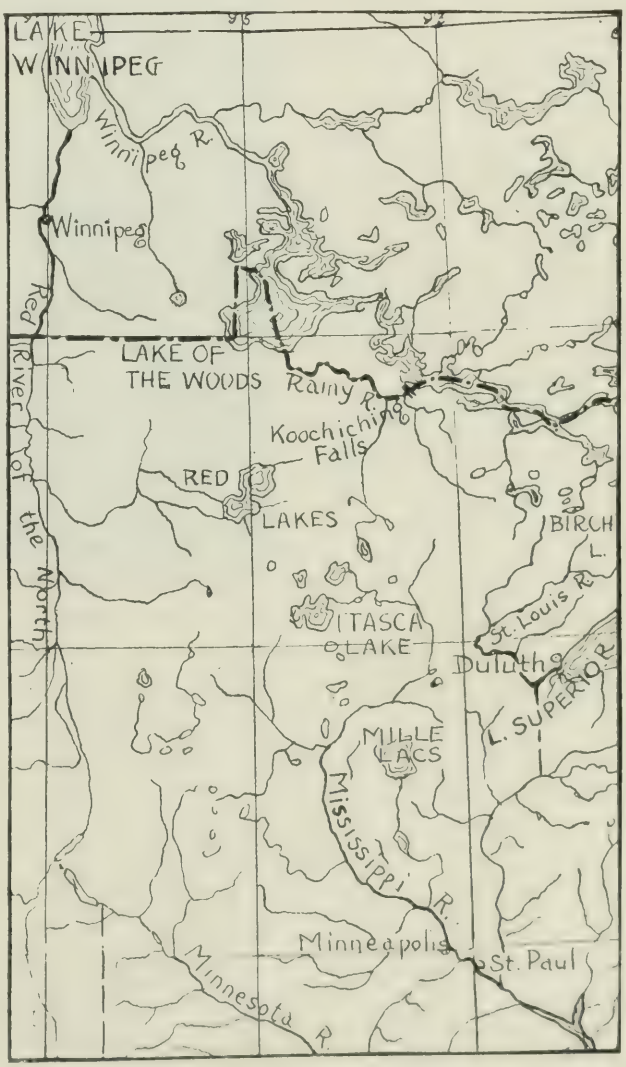
any one else the value of the water power, the navigation and sanitary advantages of these lakes and rivers, and they have also become possessed of some of the richest agricultural lands in America. These people are neighbors and friends, the same as are found in other parts of the continent, but they live in different national jurisdictions which, under the old methods of diplomacy, drew them away from each other by sending their complaints in different directions to Washington and London.

There has been developed between five and six million horse power in the United States from the use of water, and it is estimated that there is almost as great an amount of undeveloped water power along our international boundary. Civil engineers estimate that a million horse power remains undeveloped at one point in the St. Lawrence between New York and Ontario, and there is a practically undeveloped field in the Northwest, in the basin of the Lake of the Woods, where topographical surveys will have to be made to determine the amount of power which can be produced from the use of the thousands of lakes and rivers.

The great fountain head of the greatest river systems on the North American continent is in northern Minnesota and western Ontario, extending for 100 miles north and south of the international boundary. In that region there are 20,000 lakes and they are the reservoirs that supply the Mississippi River, the Red River of the North, the Rainy River and the Lake of the Woods, and the St. Louis River, which is the principal tributary of Lake Superior. The waters of these lakes flow south to the Gulf of Mexico, east thru the Great Lakes and the St. Lawrence River to the Atlantic Ocean, and north thru the Red River of the North, the Lake of the Woods, and the Winnipeg River and the Nelson into Hudson Bay. This international fountain—for that is what this lake region really is—presents one of the greatest international problems we have on the continent, a problem not realized while the country along the international boundary west of Lake Superior remained unsettled. But in the last ten years thousands of people have taken up homesteads in northern Minnesota and western Ontario, and other thousands have gone into the woods to make timber and get it to the market, build sawmills and paper mills, build towns and create power plants by the use of the water.

If the United States had succeeded sixty years ago in establishing the international boundary at 54° 40′ this problem would have been national, to be controlled by the legislation of Congress touching water rights and conservation. That "Fifty-four forty or fight" was, however, only a campaign cry which was soon forgotten when we went to war with Mexico, annexed Texas, and acquired California, New Mexico, Arizona, and other Western territory. We settled back to the old line on the north, and it has been permanently fixt and marked as the boundary between the United States and Canada. The great fountain head of the greatest river systems on the continent is, therefore, international, and there national jurisdiction comes in conflict with the imperial jurisdiction of Great Britain to make the laws of Congress ineffective even within the territory of the United States where the drainage is into the jurisdiction of Canada. The treaty of 1909 between Great Britain and the United States was made to adjust some of the differences touching jurisdiction along the boundary, and the International Joint Commission was created to exercise this international jurisdiction and to conduct investigations.

The people along the boundary are trying to develop this common water power to their own advantage under authority of their respective governments, and also under the restrictions of their own governments touching conservation and water resources, and in the past they have found their authority practically nullified because this authority from either Government could not extend across the international boundary. The United States could give permission to develop water power on its side of the line and so could Canada on the other, but neither could give such authority as would bridge the boundary or protect the people on the other side from the diversions of water made under authority of one government.



For instance, in the Lake of the Woods drainage basin, there have been contro-

versies for fifteen years, with threats of violence, because there was no common jurisdiction and no common tribunal for the people to appeal to. The Canadians began to develop water power at the outlet of the Lake of the Woods in 1892. They had the authority of the Dominion and provincial governments to construct a dam in their own territory in waters that were apparently under their sole jurisdiction. But the dams they constructed raised the level of that lake, which is more than 100 miles long, covers 1400 square miles, and extends into the State of Minnesota. The higher level of the lake submerged several thousand acres of farm lands in Minnesota and dispossesed a large number of American farmers, who complained to the State of Minnesota and the United States.

Then the United States granted a right to a corporation to develop water power at Koochiching Falls in the Rainy River, which is the principal tributary of the Lake of the Woods. The Canadian Government also gave authority and the dam was constructed, furnishing power to the largest paper mill in the world at International Falls, Minnesota. That dam held back the water and interfered with the water power at the outlet of the lake on the Canadian side, and there were complaints to the Dominion Government and to Great Britain. The people on the Canadian side of the Rainy River also complained that they received no benefit from the paper mill on the American side and another mill was built on the Canadian side by the same company to satisfy those demands, but the increased power necessary for two mills caused complaints from the navigation interests that there was not enough water in the Rainy River below the falls for their steamboats and log rafts. It also caused the fishermen to complain, and after utilizing all known diplomatic machinery to settle the four-cornered controversy between power development on both sides of the line, the navigation, agricultural, and fishing interests, the two governments decided to refer the whole question to the International Joint Commission.

The city of Winnipeg, with 200,000 population, has its municipal power plant located on the Winnipeg River, which is the outlet of the Lake of the Woods, and it has authority from the Dominion Government to use the water for power to light the city, furnish motive power for the street railways, etc., and that city has complained that people on the United States side of the line are holding back waters which belong to Canada under international agreement. Duluth, down on Lake Superior, is also anxious to divert the waters of the Birch Lake basin into the Embarrass and St. Louis rivers to create power for that city, and claims that this water belongs to the State of Minnesota, tho it is tributary to the Rainy River on the boundary.

The drainage basin of the Lake of the Woods is about 26,000 square miles, divided almost equally between Canada and the United States. Neither government has made topographical surveys in this

WHERE THE COMMISSION'S PROBLEM LIES

The map shows most of Minnesota and part of Manitoba and Ontario. To be strictly accurate it would have to indicate 20,000 lakes. From this region a man in a canoe could go either to Hudson Bay, the Gulf of St. Lawrence, or the Gulf of Mexico.

territory to determine the natural elevation of water levels, or the definite boundaries between this basin and other drainage basins. No man can tell definitely which of the thousands of lakes in northern Minnesota drain into the Lake of the Woods and which into other water basins. The commission will have to perform the work usually done by the two governments, make surveys and determine the drainage area of the lake, the average run-off of the tributaries, and in fact what are the conservation requirements in this region to fix a level that can be maintained for the best interests of all concerned.

In the effort to conserve the health of the people along the international boundary the governments of the United States and Great Britain in the treaty of 1909 agreed "that the waters herein defined as boundary waters, and waters flowing across the boundary, shall not be polluted on either side to the injury of health or property on the other." Last August the two governments referred to the International Joint Commission two questions: first, whether these boundary waters are being polluted on one side of the line to the injury of health and property on the other side; second, if there is such pollution, how can it be remedied?

There are about 7,500,000 people living in cities and towns along the boundary waters between Canada and the United States. These cities and towns have used the Great Lakes and rivers of the boundary and their tributary waters for drainage, and their sewers empty into these waters. They generally have their water supplies in these same lakes and rivers. If such cities as Detroit and Buffalo, Milwaukee and Duluth, are polluting boundary waters so that the pollution crosses the boundary, they are violating the obligations of the treaty. If such cities as Toronto, Hamilton, and Port Arthur on the Canadian side are sending sewage pollution across the boundary to the United States they, too, are violating the treaty.There have been typhoid epidemics in nearly every city and town on both sides of these boundary waters, and the sanitary experts as well as the people place the blame for these epidemics on the pollution of their water supplies. Many of the people also believe that the pollution comes to them from the other side of the boundary. The Province of Ontario has a drastic law against the pollution of these waters. The Dominion Parliament is considering such a law. Some of the states along our northern boundary are agitating for similar laws, and national legislation on the same subject is also urged. The two governments have asked the International Joint Commission to make an investigation as to the facts. Sanitary experts estimate that this inquiry will cost $50,000 and take at least six months' time. It will involve the examination of sewage currents and the taking of samples from the lakes and rivers where pollution occurs. The commission is not clothed with power to compel any city to change its sewerage system. If it finds that the treaty is violated it can make recommendations as to remedies.

The commission last fall traveled up and down the Rainy River, crossing and recrossing the international boundary, sailed up and down the Lake of the Woods, visited great water power developments which promise to revolutionize old industries and methods of transportation and make this region rival the beehives of New England; heard the tales told by promoters and capitalists, by engineers, drainage experts and conservationists representing the newer progress, and by loggers, rafters, fishermen, and Indians, who cling to the good old ways, all presenting reasons why the Lake of the Woods and its tributary waters should be maintained at a higher level, or at a lower level than now exists. The six commissioners, trained in the law, with their engineers trained in the art of controlling waters by conservation, spent a week on the Lake of the Woods, and left the engineers there to gather data on water levels, on the amount of land to be submerged by higher levels, and on the diminished power resulting from lower levels. They also invited the conservation experts of Minnesota and Ontario to join the engineers in working out a reasonable solution of the problem.

Washington, D. C.

Conversation in Ireland

By Lady Gregory

[Lady Gregory is well known in America, both personally and for her literary work. She has given to the Abbey Theater a score of pleasant comedies and delightful farces, and the Irish Players (this season and last) have acted some of them before American audiences that have responded with hearty and wholesome laughter. One of the critics of the latest of the farces, *Coats*, pays its author the compliment of suggesting that she has seen more deeply into the nature of the rural Irishman than have the more pretentious playwrights of the Celtic Renaissance. The opening essay in Mr. Yeats's new book, *The Cutting of an Agate*, is devoted to Lady Gregory's translations from hero tales and other Irish literature, and two volumes of her *Folk History Plays*, as well as a volume of *New Comedies*, have lately been issued by the Messrs. Putnam.—EDITOR.]

I was asked the other day to mention some characteristics of the Irish countryman, and I said, "His conversation." It was Oscar Wilde who, lamenting some defect amongst us Irish, said, "But we are the greatest talkers since the Greeks." I think it is the habit of conversation that makes the writing of drama come more easily to us than to the English, who look upon reading as more important, whereas our people will say, "There is no man able to read books who can tell a story out of the mouth," or "There is no man that reads is able to keep any memory at all." I have heard as great praise of a girl, "She would keep you talking until morning," and a girl lamenting her dead brother to me said, "When we were children we would be telling stories to one another when all the world was asleep." And one hears again and again in the gamut of praise, "He is a very conversible person," or "You wouldn't be tired listening to him." Orators have their chance of learning their trade with such an audience, so that I have been proud to see even at Westminster the House fill when an Irish member was beginning to speak. It doesn't matter if the subject is an old one, "the thing you'd know you'd like to go on and to hear more or less about it," says Mrs. Broderick of Cloon. Even strife is better than silence. *Is fearr imreas na uigenas;* "it is better to be quarreling than to be lonesome."

LADY GREGORY

Long ago I spent some winters in France, and I saw something of the method of the salons. All the party would gather in the evening round an oval table, the men with cigarettes, the women with hands folded on the table. They would begin the talk on whatever subject drifted in, it did not much matter what, one or another would take it up, and each got a chance. It was even expected that each should put something into the pool; I myself, a foreigner, was not exempt. It was a good training, I think. I remembered this when, many years later, I went to stay in a fisherman's house in an island off the Irish coast. After dark the fishers are at home and have eaten; the fire is stirred and flickers on the dried mackerel and conger eels hanging over the wide hearth. The little vessel of oil, squeezed from the codfish, has a fresh wick lighted. The men sit on the floor in a half circle, passing the lighted pipe from one to the other; the women listen, tho still finding some work with yarn or wheel, and come over and join in when they have something to say. In seeing this, I felt that I had come again into the method of those French salons. And as to the talk I have heard under that thatched roof and under

others in Burren and Connemara and Kiltartan, it holds its own with the best, being in the likeness of Nebuchadnezzar's image, for if the feet are of clay and of iron, the high head is of fine gold. The talk may begin with the broken harvest or the new knowledge that has come in with coöperation. "The shopkeepers had the people robbed, and every corner boy was setting up a shop with manures, and the farmers were running in one after another like rabbits into a hole, every one laying down his money on the counter. But now they have learned to look into things for themselves, and to look at the samples and the proportion of ammonia and of superphosphates. And is it no education for a man to have to stop and ask himself, 'What is ammonia?'" Or one says, "I didn't join the coöperative society yet, but I will next year. I thought it wouldn't be worth my while, so little as I want. And I held out till I saw the seed potatoes; but when I saw them, that were like that grand seed we got eighteen years ago and that's getting worn out now, I thought by some way or other I must get hold of that. So I went to Mr. F. and asked him could he manage for me to have some without paying the half crown entrance, for all I wanted was a bag of potatoes and three hundredweight of guano; and he said, 'There's a committeeman just passing by.' So I spoke to him and I won't tell you who he was, but he said, 'I'm just going to buy seed and manure for myself for cash, and I'll get what you want for you.' So I gave him cash and he got me what I wanted, and surely if I live I'll join next year." Or America and England, foreign countries both, tho America is nearer far, may come under discussion. "There is full and plenty for everyone in America," but all do not go, for there is hard work there, too, and there are chances of ill luck, and, says Bartley Fallon, "I'm thinking if I went to America it's long ago the day I'd be dead." And besides the tea is not so good, being made with "water brought into the houses thru pipes from the deer knows what distant place and not from the spring well that you know," and many come home from there out of their health, if there are "pavements that would not soil your silk dress." As to England, it is a place without religion; and an old man who speaks with authority because he went to earn there in the hard times and was "for five quarters in a country town called Manchester," tells of its ways with at least as much knowledge as many a traveler who writes a book about a country not his own. "It is the custom in England never to clean the table but once in the week, and that is on a Saturday night, and on that night all is set out clean, and all the crusts of bread and bits of meat and the like are gathered together in a tin can and thrown out in the street. And women that have no other way of living come round there with a bag that would hold two stone and they pick up all that is thrown out, and live on it for a week."

My old pauper, Michael Miskell, in *The Workhouse Ward,* scorns an offer of tobacco made by the friend who is leaving him and says, "All I'm craving is the talk." And it was in a workhouse I heard as spirited a discussion as to the merits of two poets, dead and gone, as the French salons could give. Two old women had heard and seen, in their childhood, these rival poets Raftery and Callinan, and one of them said: "Raftery hadn't a stim of sight and he traveled the whole nation, and he was the best poet that ever was and the best fiddler. It was always at my father's house, opposite the big tree, that he used to stop when he was in Kilchreest. I often saw him, but I didn't take much notice of him then, being a child; it was after that I used to hear so much about him. Tho he was blind he could serve himself with his knife and fork as well as any man with his sight. Callinan was nothing to him."

The other old woman, who was from Craughwell, said: "Callinan was a great deal better than him, and he could make songs in English as well as in Irish. Raftery would run from where Callinan was. And he was a nice, respectable man too, with cows and sheep, and a kind man. He would never put anything that wasn't nice into a poem, and he would never run anyone down, but if you were the worst in the world he'd make you the best in it, and when his wife lost her washing-beetle he made a song of fifteen verses about it." "Well," says the Kil-

chreest old woman, "Raftery would run people down. He was someway bitter; and if he had anything against a person he'd give him a great lacerating. But there were more for him than for Callinan; some used to say that Callinan's songs were too long."

"I tell you," says the other, "Callinan was a nice man and a nice neighbor. Raftery wasn't fit to put beside him. Callinan was a man that would go out of his own back door and make a poem about the four quarters of the earth. I tell you, you would stand in the snow to listen to Callinan." And just then another old woman, spending her last years in one of those workhouse beds, suddenly sat up and took her own part in the conversation by singing as long as her breath lasted one of Raftery's songs. This is the English of it:

I would wed courteous Brigit without coat, shoe or shirt. Treasure of my heart if it were possible for me I would fast for you nine meals, without food, without drink, without my share of anything, with desire for you and me to be together till we would settle our case. My heart started with trouble and I was frightened nine times that morning I heard you were not to be found. I am in grief and in sorrow since you slipped from me across the mering'. I would sooner be stretched by you with nothing under us only heather and rushes than be listening to the cuckoos that are stirring at the break of day.

In many a cottage home I have heard the talk turn after a while to what is unseen and outside the world. For the veil between things visible and things invisible has scarcely thickened since angels fought in the air for the souls of the dead and Columcille joined in the fight, or since those yet earlier heroic ages when sons of gods mated with the daughters of men. There is another community very near; there is some power outside ourselves, under God, subject to laws of its own, keeping the name of the Sidhe, the dwindled, defeated gods, but it may be old dwellers in a yet higher heaven.

"Fallen angels they are said to be. God threw a third part of them into hell with Lucifer, and it was Michael that interceded for the rest. And then a third part were cast into the air, and a third in the land and the sea. And here they are all about us as thick as grass."

An old man, one of the talkers, says: "Good neighbors make good neighbors. And no woman minding a house but should put a couple of potatoes aside on the dresser, for there is no house but they will visit at some time or another. Myself I always brush my little floor clean of a night before I lie down, and the night I'd do it most would be a rough night. How do we know what poor soul might want to come in?"

Another says: "All I ever saw myself was one day I was out fishing with two others. And we saw a canoe coming near us and we were afraid it would take away our fish. And as we looked it turned into a three-masted ship and people in it. I could see them well, dark colored and dressed like sailors. But it went away and did us no harm."

"There was a girl that had been to America and came back," says another. "And one day she was coming over from Liscannor in a curragh and she looked back, and there behind the curragh was the gan-ceann, the headless one. And he followed the boat all the way, but she said nothing. And a gold pin that was in her hat and that she had brought from America fell out and into the sea, and then it disappeared. And her sister was always asking her where was the pin she brought from America, and she was afraid to say. But at last she told her, and the sister said, 'It is well for you it fell out, for what was following you would never have left you till you threw it a ring or something made of gold.' "

It is not always they are content with trinkets, for "there was a smith, and a man called on him late one evening and asked him to shoe a horse for him, and so he did. And then he offered him pay, but he would take none. And the man took him out behind the house and there were three hundred horses with riders on them and a hundred without, and he said, 'We want riders for these,' and they went on out of sight."

Such stories were called superstition a while ago, but now the scientific men of Europe, especially of Paris and of Italy, are with many tests and with much sifting, bringing back belief in the invisible life, in the cloud of witnesses, to whom thru the ages our people have borne their testimony. Many of them will tell in these twilight talks how they have

seen and spoken with their dead. And as to our Lord, He is no stranger in the talks, for He "walked the whole of Ireland without shoes and barefoot." And whatever spirits of evil may enter into other beasts, "the lamb is always innocent because of Him." And as to the robin, that comes into many an ancient story: "The little birdeen that has red under its throat, it is the blood from the Cross that is on him. He is very friendly besides the other birds; if you are working in the garden he will come and sit on the handle of the spade if you are a little while from it. No one would hurt him, and he would come into the kitchen, too, unless the cat might tempt him away."

And surely sometimes the "conversation is in Heaven," and it was in a poor laborer's house I heard one say, "Our Lord is seen on the earth sometimes, not often. He just comes to put some poor person back in the way. But sure He is in every place. He is here now, sitting in a chair and His hand like that, holding His knee, listening to everything and watching everything. He never went to bed—didn't you know that? but sitting in a chair as I told you, thru the night, keeping a watch on the people."

New York City.

Paddy and the Parson

By Denis A. McCarthy

There are many stories in Ireland illustrating the zeal of the Protestant Established Church to make converts from among the Irish peasantry, who, it need hardly be said, were and are steadfast adherents of the Catholic Church. Many of these stories are intensely pathetic, showing the struggle of a much-tempted people to cling to their old faith; others furnish amusing examples of the deftness with which an Irishman can get out of a difficulty. Here I have simply put into rime a story which I heard as a boy in Ireland.

Says the Parson to Paddy: "Your cow is a bad-looking beast.
What makes her so scrawny and thin?"
Replied Paddy: "No wondher! The crathur gets hardly a taste;
Sure my land here is not worth a pin.
This place I pay rint for is nothin' but mountain an' bog,
An' the grass is both scanty and poor;
Ah, but if I had only the good grass to give her, begog,
She'd be as fat as your own, I am sure."

Says the Parson: "Well, Pat, you may send your cow up to my farm,
And there let her eat to her fill;
And all that I'll ask for her grazing won't do you much harm—
In fact, 'tis to help you it will.
Just come to my service next Sunday—ah, don't be a slave
To Father Maguire and his Mass!—
Come and hear me expounding the Bible; your soul it may save,
And remember—your cow's on my grass."

Well, up went the cow to the minister's farm. And then
Came Sunday to puzzle poor Pat.
Oh, he went to his usual Mass with the rest of the men,
Faith, he thought he'd be sure about that.
But then as the day wore along and he thought of his "baste"
He didn't know just what to do.
"Arrah, sure, his ould sermon," says he, "won't hurt me the laste"—
So he went to the Parson's church, too.

But of Pat's double-dealing on Monday the minister heard,
And hastened to take him to task.
"Ah, Paddy, you villian," says he "you have broken your word!
What's the meaning of this, may I ask?"
But Pat was demure, tho his eye gave a comical roll,
As he made this remark with a bow:
"Your honor, I wint to *my* church for the good of my soul,
An' to *yours* for the good of my cow!"

John H. Patterson

A Defense of the President of the National Cash Register Company

By Frank Crane, D.D.

A unique situation developed in the flood situation at Dayton, Ohio, when it became known that John H. Patterson had become the acting head of the stricken city, supplanting the Mayor and having authority even over the militia, who are in charge under martial law.—*New York World, March* 31.

One of the most striking dramas of recent years is J. M. Barrie's *Admirable Crichton,* in which he depicts a modern typical English family, with all their snobbish feeling of caste, shipwrecked upon an uninhabited island, where it is soon discovered that the real man, the natural, resourceful leader, is their servant Crichton. Face to face with sheer necessity and Nature's uncompromising dangers, it is he who takes charge and becomes a little autocrat, until they are rescued, and under the false conventions of society he drops back into his former servile position.

The United States has just witnessed a more powerful drama played in actual life, upon a vast scale, teaching the same lesson.

Some time ago the Government, anxious to make a trust-busting record, moved heaven and earth to convict John H. Patterson under the Sherman law, and had him sentenced to jail.

I am not going to discuss that trial and verdict. I couldn't do justice to it in print without getting into trouble with the postal authorities. Patterson does not complain. When the business world of Dayton, including Patterson's business opponents, held a mass meeting and wanted to pass a resolution condemning the court, it was Patterson who plead with them and induced them not to do it. That showed symptoms of a real man.

Now comes the most widespread disaster the Middle West has ever known. The city of Dayton is suddenly submerged by a flood. City government is paralyzed. Lives are in danger. It is one of those crises where the artificialities of civilization are rudely brushed away and men stand face to face with destruction.

At this juncture the entire community turns to one man. He has no office nor title. He is not mayor, governor nor military commander. He is a man whom the court has declared to be upon a level with chicken thieves and porch climbers. But by one common accord, without a dissenting voice, the city and state authorities, the leading business men and the entire body of the common people turn to this man and place their lives and fortunes in his hands.

He is chosen temporary king and dictator as naturally as two and two make four.

In no conceivable way could it be better shown how profound the confidence and respect a whole state has in its foremost citizen.

Patterson, sixty-three years of age, gives his entire manufacturing plant over to the stricken people. The hungry are fed, the sick are tended. He organizes the mob of bewildered citizens with the skill of a field marshal. He sends his own daughter to nurse the sick, his own son to rescue the drowning. He himself is busy night and day, untiringly efficient.

The Governor of Ohio openly declares that the entire community is under a load of obligation to John H. Patterson.

When the head of the United States army comes to the field he recognizes the rule of Patterson and coöperates. Soldiers seize automobiles and put upon them a placard that they are to be used for public service until released by order of John H. Patterson.

It might not be a bad thing for the people of this country to know the kind of a trust magnate this man Patterson is. He has not taken his profits and hiked to Europe, he has not devoted himself to gathering bric-a-brac nor to endowing colleges and churches. He has devoted all his money and energy to *improving the conditions of his work-people,* and of spreading the gospel of decent wages and human treatment of all work-people.

In what is called "welfare work," that is, humane consideration for operatives, Patterson is the one man in America who ranks with the Krupps of Essen, the Cadburys of Birmingham and Sir William Lever of Liverpool.

I do not want to criticize our courts, nor do I want to palliate in any wise the crimes of corporations, but it is certainly going to be an odd spectacle when such a man is marched to jail.

The court had its say; it said, this man is a public menace, lock him up.

Nature, danger, death and primeval chaos have risen suddenly up and have had *their* say. And what they say is that of all the people this is the one man who should *not* be locked up. In such panic moments the moral air is cleared. The people of that community where Patterson's life has been spent swept aside the technicalities of the law, they turned to him as naturally as a child to its father, as a wife to her husband, for they knew him, they believed in him and into his care they committed themselves and all they have. The whole people have reversed and remanded the court's decision.

It may be said that Patterson's actions in the floods have nothing to do with his "crime." I somehow think they have a deal to do with it. The sum total of any man's life has a bearing upon any one of his deeds.

They may put John H. Patterson in jail, but if they do the people of Dayton will rebuild it as a king's palace, and his cell will be a throne room where the rich and poor, high and low, will be proud to do homage to a *real man.*

The silly attempt to cure the evils of the system under which all modern business is conducted by making a scapegoat of one man may please the mob who have the old mob-madness for the blood of a scapegoat; the zigzag lightning of the law may strike the old man dead; but

> . . . this Duncan
> Hath borne his faculties so meek, hath been
> So clear in his great office, that his virtues
> Will plead like angels trumpet-tongued against
> The deep damnation of his taking off.

New York City.

Should We Enjoy Our Meals?

By Henry T. Finck

[Mr. Finck, who some twenty-six years ago demonstrated the importance of the appreciation of personal beauty as a factor in evolution, has recently been studying the function of food flavor from a hygienic and esthetic standpoint. In addition to *Romantic Love and Personal Beauty* he has published a dozen or more volumes of musical biography and travel and has served as musical critic and general editorial writer of the *New York Evening Post* since 1881.—EDITOR.]

Many wonderful discoveries have been made by Thomas A. Edison, but the most surprising of them all is the discovery that "eating should not be a pleasure."

When I read this startling assertion in *Good Housekeeping* I was the more amazed—and amused—because I happened to be busy reading the galley proofs of my book, *Food and Flavor: A Gastronomic Guide to Health and Good Living,* which the Century Company publishes tomorrow (April 18), and the very gist of which lies in the assertion, printed in italics, that "the most important problem now before the American public is to learn to enjoy the pleasures of the table and to insist on having savory food at every meal."

"Eating is to me no more a pleasure than breathing, nor should it be to any one," says Mr. Edison. "Every woman who cooks her husband's meals should hold tight to the fact that it is no part of her business to fix up dishes for him to give him pleasure."

Here is comfort for the thousands of women who are too indolent or too ignorant to cook savory meals for their husbands, thus driving them to clubs and saloons!

What are Mr. Edison's reasons for disapproving of the pleasures of the table?

They are the same as those which prompted the father of Walter Scott, when young Walter one day exprest his enjoyment of the soup, to mix with it

promptly a pint of water to take the devil out of it. In other words, Mr. Edison holds that "food that tastes too good is dangerous. It leads to overeating, and overeating leads first to disease and then to premature death."

While gluttony is not nearly as common a vice as it used to be, it cannot be denied that many persons do eat more than is good for them. What I maintain, however, and demonstrate in my book, is that at present a much larger number come to grief because they do *not* sufficiently enjoy their meals, and that our salvation lies in our becoming a nation of gastronomers, understanding fully the importance to health and happiness of raising only the best foodstuffs, cooking them in savory ways, and eating them with intelligence and pleasure.

Most of the food placed before Americans is either so badly cooked, or so adulterated or denatured by the use of chemical preservatives (in place of the old-fashioned appetizing condiments), that it is difficult to get any enjoyment out of it. Under these circumstances Mr. Edison's demand that "food should be to the body only what coal is to the boiler of a steam engine" is literally fulfilled. Most persons shovel in their victuals merely to keep going, and then pass on to other things more agreeable; *and that is the reason why we are a nation of dyspeptics.* Enjoyable meals alone can cure us.

Denatured or badly cooked food is not appetizing, and when food is not appetizing it lies in the stomach like coal, the result being dyspepsia.

Mr. Edison's belief that we should not enjoy our food rests on his misunderstanding of the significance of appetite, which he differentiates incorrectly from hunger. "One has hunger for bread and appetite for whisky," he says, confusing appetite with morbid craving.

For a correct definition of the word appetite it is safer to go to a physiologist than to an electrician. The leading European authority in physiology, Professor Pavlov of St. Petersburg, has thrown the bright light of scientific experiment on this subject. He demonstrated in his laboratory that the mere presence of food in a dog's stomach—which in that respect is like a man's—does not suffice to cause a flow of the gastric juice (without which digestion cannot go on), but that the psychic factor we call appetite—a keen desire for food—causes an abundant flow of that fluid.

"Appetite juice" is one of the suggestive names he gives to the fluid which digests food in the stomach. There is little or none of it for the unhappy man who follows Mr. Edison's dangerous doctrine—the absent-minded man who eats as unconsciously as he breathes, who pays no attention to his food, who is unable to keep his thoughts from his work, as is so often the case with those who live in the midst of the turmoil of big cities. This inattention to the flavor of food prepares the way for digestive disturbances with all the various diseases attending them. No medical treatment can help such a patient; he must reform and try to learn how to enjoy his meals in order that there may be an abundant flow of the digestive juices secreted in the mouth, the stomach and the pancreas.

Professor Pavlov especially bewails the "absolutely unphysiological indifference toward eating" which is so often found, and he maintains that "in wider circles of the community a due conception of the importance of eating should be disseminated. How often do the people who have charge of the commissariat pay attention solely to the nutritive value of the food, or place a higher value on everything else than taste."

Often it is not only the nutritive value of a food, but its appearance, that is rated higher than its agreeable flavor, which is so valuable as an aid to digestion. Judges at county fairs excel in this sort of folly. George K. Holmes contributed to the *Yearbook of the Agricultural Department* for 1904 a striking instance of it: "Altho it may seem that it is positively not worth while, to say nothing of money, to buy a nut except to enjoy its flavor, yet to taste is assigned only 25 per cent, while 50 per cent is given to the eye, the remaining 25 per cent going to the convenience of cracking the shell."

It is against this kind of foolishness that some of the guns in my book are trained.

One of the standing jokes in our comic papers concerns the "hayseed" who comes to town and buys a "gold brick." If the

farmers edited comic papers, they would have a standing joke about the city greenhorns who buy their most showy but insipid fruits and vegetables, leaving them the best flavored kinds if they do not happen to be pretty to look at. Of this "eating with the eyes" there is a great deal; indeed, it is responsible for most of the deceptions practised by canners, grocers and marketmen. The consumer is as much to blame as the man whose pocketbook fattens on the buyer's ignorance.

A greenhorn is defined in the dictionary as "a person who is easily imposed upon." You prove yourself a greenhorn if you go into a grocery store and buy glasses of preserved fruits and vegetables dyed in brilliant rainbow hues such as no honest fruit ever exhibits. You show yourself a greenhorn if you buy cakes dyed yellow with chemicals instead of with nutritious eggs; or a hundred other things which appeal to the eyes but leave the palate unsatisfied.

It is not only the appearance of food, however, that usually claims too much attention. Its nutritive value, also, has received more than its share, as compared with flavor, in which, I maintain, lies the key to the whole food problem. Undoubtedly the nourishing property of food is of great importance; without it we could not live. Yet, as Luther Burbank has keenly remarked, if we eliminate palatability (that is flavor) from food, it is no more than a medicine "to be taken because it produces certain necessary results." Moreover, a little of this medicine goes a great way. Horace Fletcher lived for years on eleven cents a day; and two university professors—Dr. J. L. Henderson, of Harvard, and Dr. Graham Lusk, of Cornell—have demonstrated, independently, that a dime a day intelligently expended is enough to keep body and soul together. What more we spend on food (unless we are greenhorns buying for the eyes) goes chiefly for flavor. It is the flavor that makes us willing and eager to pay more for good butter than for good oleomargarine, for fresh chicken than for cold storage fowl, for Virginia or Westphalian ham and Wiltshire bacon than for ordinary ham and bacon, and so on thruout the list of foods, for there is no difference in nutritive value in any of these cases.

This being so, it seems passing strange that while so many good books have been written on the nutritive aspects of foods, mine is the first volume in any language treating specially of this same flavor which is so important to our health because of its appetizing qualities. The explanation lies in the fact that flavor is generally looked upon as something merely agreeable, like the fragrance of strawberries or the vanilla or other flavoring extracts we put into ice cream.

President E. B. Tylor, of the British Anthropological Association, declared that "cookery is an art which almost more than any other has civilized mankind." In a chapter on "The Science of Savory Cooking" I have shown that the main object of cooking is to develop the countless flavors latent in good raw material, to combine them or to add others where the material is deficient in natural flavor. The French have done more to civilize mankind by their culinary art than in any other way.

Mr. Edison complains that women "do not take enough pains with their cooking." But why on earth should they take pains with it if, as he maintains, "food should be to the body only what coal is to the boiler of a steam engine"? If it is needless or even dangerous to enjoy savory (that is, properly cooked) food, why not live on plain oatmeal and beans year in and out, abandon the science and art of cooking, and let civilization and health go hang?

When Ruskin wrote his *Modern Painters* he referred to the indulgence of taste as "an ignoble source of pleasure." He lived to realize the foolishness of this sneer. In one of those amusing footnotes which he contributed to the final edition of that great work, and in which he often assails his own former opinions with merciless severity, he refers to the "cruelty and absurdity" of his failing to appreciate the dainties provided by his father. But his earlier opinion reflected a common attitude of that time toward the pleasures of the table.

This attitude was a consequence of the gluttony that had prevailed for a long time in England. Dr. Johnson sneered at gluttons, yet he was one himself. Boswell informs us that "when at

table he was totally absorbed in the business of the moment: his looks seemed riveted to his plate; nor would he, unless when in very high company, say one word, or even pay the least attention to what was said by others, till he had satisfied his appetite, which was so fierce, and indulged with such intenseness, that, while in the act of eating, the veins of his forehead swelled, and generally a strong perspiration was visible."

In the pages of Samuel Pepys I have found a record of the following sample repast, which, as he boasts, was prepared by his "own only mayde": "We had a fracassee of rabbits and chickens, a leg of mutton boiled, three carps in a dish, a great dish of a side of lamb, a dish of roasted pigeons, a dish of four lobsters, three tarts, a lamprey-pie, a most rare pie, a dish of anchovies, good wine of several sorts, and all things mighty noble." This dinner, he exclaims, joyously, "was great." It certainly was. Such gluttony is very rare today. It is no longer good form to eat too much or to urge guests to take more than they want. I lunch in New York restaurants about 250 times a year and have done so for more than thirty years; yet I do not remember having seen in all that time a single person whom I could have pointed at as a glutton. But I have seen many hundreds who undoubtedly injured their health, and shortened their lives by *not giving themselves time to enjoy what they were eating.*

"Men are animals and have a right to enjoy without reproach those pleasures of animal existence which maintain health, strength and life itself," wrote President Eliot of Harvard some years ago. The great menace to health and long life is not gluttony, as Mr. Edison thinks, but bolting and indifference to the pleasures of the table. It is surely preposterous to ask that these wholesome pleasures be taken away because some foolish persons now and then eat too much. These persons should be admonished that gluttony is a vice which defeats its own end. By eating less and in a more leisurely way much more pleasure can be got from one mouthful than by bolting a whole plateful.

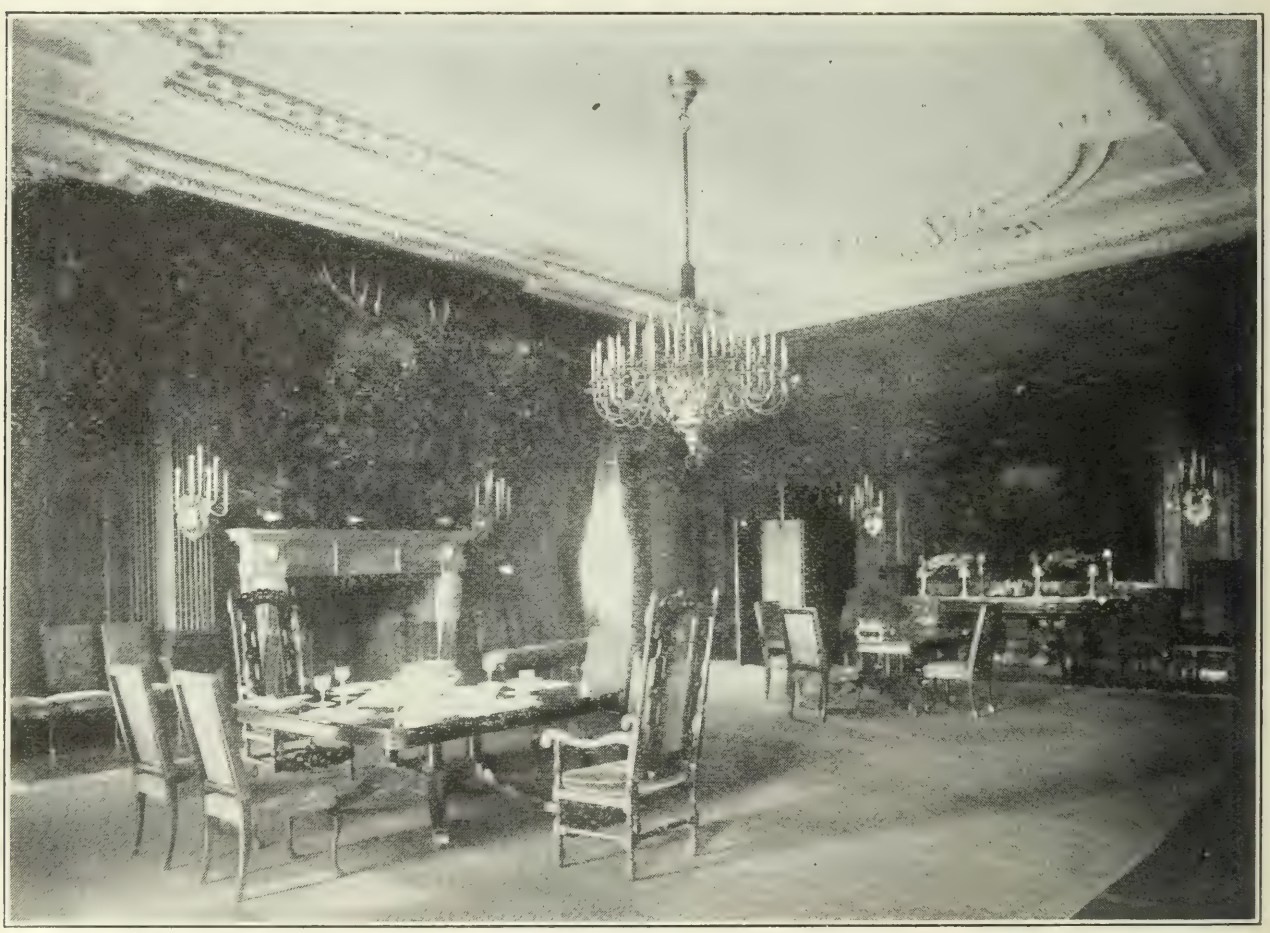
A true epicure would no more dull the edge of his appetite for future pleasures of the table by over-indulgence than a barber would think of using his razor to whittle kindling wood. Our aim should be to make this a nation of epicures; that is, persons who select their food with fastidious care, who refuse to eat anything that has no flavor, or a wrong flavor, and who try to get as much enjoyment as possible out of a meal, be it simple or elaborate.

In the second and thirteenth chapters of my book I have shown how we can double, nay, quintuple our enjoyment of table pleasures, thereby adding greatly to our health and happiness. After devoting years to the intensive study of gastronomy, at home and abroad, I have come to the conclusion that Brillat-Savarin did not exaggerate when he wrote that "the destiny of nations depends upon what and how they eat." Knowing how much better they do some of these things in Europe, I made a special gastronomic trip last summer to gather information at first hand in the market places, gardens and restaurants of France, Italy, Germany and England. Everywhere I discovered that the best-flavored foods (for example, Bresse chicken, Wiltshire bacon, Westphalian ham) commanded the highest price, and this induced me to write a long chapter on the "Commercial Value of Flavor," with many concrete cases showing how farmers, vegetable gardeners, stockmen and all who handle food products can increase their income and even make big fortunes by improving the flavor of food products. There are unlimited opportunities, for women as well as for men.

New York City.

The Lady of the White House

By Hester E. Hosford



[Miss Hosford writes of the Wilsons as a friend of the White House family, and not as a professional representative of the press. It will be remembered that she is the author of a campaign life of Woodrow Wilson, and that she contributed to THE INDEPENDENT two interesting sketches of the Wilson family, one on July 11, 1912, following President Wilson's nomination, at Baltimore, and the other November 21, 1912, following his election to the Presidency.—EDITOR.]

This is a republic! Verily, a republic! Not quite twenty-eight years ago a young man who had been appointed assistant professor in a woman's college took his bride to live in a little cottage at Bryn Mawr, Pa. On March 4, 1913, he took his wife to live at the White House, in the nation's capital. This is America!

The White House has been the home of the Presidents since the time of John Adams. George Washington selected the site, laid the corner-stone in 1792, and with his wife inspected the finished building in 1799. The building is of Virginia free-stone. After the house had been set on fire by the British troops in 1814, and only the walls were left standing, the restored exterior was painted white to obliterate the marks of the fire.

In furnishings and equipment the White House does not lack anything essential for the comfort and happiness of the head of a great nation and his family. It is a matter of history of which every American may be justly proud that, as a nation, we have provided a home for our President which enables him to uphold the social dignity of the United States.

Since the remodeling of the White House, in James Madison's time, many new conveniences and electric contrivances have been added to the kitchen, several sets of chinaware, each containing hundreds of pieces, and a gilt state

THE STATE DINING-ROOM, USED FOR ALL OFFICIAL DINNERS

Copyright, Marceau, 1913

MRS. WOODROW WILSON

service for formal functions have been purchased. The carpets, tapestries and draperies are of rare quality. There are many oil paintings of great historic value, and a conservatory filled with multitudes of blossoms and plants.

Ex-President Taft increased the corps of social aides from six to twelve and among these gallant military gentlemen there are representatives of families who have been distinguished in history for generations.

It is a splendid establishment, this new home of the President and Mrs. Wilson.

The first house in which they lived was cosy and comfortable, without any evidence of luxury. As they journeyed from the romantic village of Ardendale, N. C., where they had been spending their honeymoon, to their new home in Pennsylvania, probably the happy couple never thought of the White House. And yet, who shall say that the bride and groom, of June, 1885, were not every whit as happy as the President and First Lady of the Land of 1913?

In 1885, Mr. Wilson led the simple, quiet life of the teacher, unhampered by newspaper correspondents or office seekers. At this time, Mrs. Wilson looked after the domestic affairs of their modest cottage, without a thought of diplomatic receptions or official dinners, undisturbed by photographers, and not annoyed by the limelight of publicity; for it seems to be one of the misfortunes of the wives of public men that they must be constantly dragged into print, frequently photographed, and usually misquoted by unauthorized persons. No small share of such a fate must come to every First Lady of the Land; and this is especially true of Mrs. Woodrow Wilson, who came to Washington practically unknown, and without any desire or inclination to dictate fashions, change customs or establish social innovations. To be sure, moderate changes of the social régime are introduced at the White House in every administration, reflecting the tastes and temperaments of the official family. During the present administration, both art and music will receive much attention,

because of the talents of Mrs. Wilson and her daughters, but there will be no attempt to reform social Washington. Those who know Mrs. Wilson understand that she is a conservative Southern woman, with simple tastes, desiring to set an example of unostentatious living to the women of America, but without the slightest inclination to dictate to others how they shall live or what they shall spend, for these things must vary with varying circumstances. Hence newspaper reports which represent Mrs. Wilson as laying down the law in these things are simply misrepresentations. All this does not mean that the new First Lady is without personality, for I have never known a woman who possessed in greater degree mental and spiritual magnetism. Indeed, Mrs. Wilson seems to have developed harmoniously her maternal instincts, her domestic tendencies, her social inclinations, and her intellectual talents. Thus has she become an invaluable complement to her distinguished husband; a companion, counselor, helpmeet, in the truest sense.

While Mrs. Wilson never dictates what other women shall do, she is quite conscious of her influence and example. In the White House, I told her of a poor woman of foreign birth, who earns a living by washing other people's clothes. This working woman had said to me: "When I go home to get my supper at night, the thought that Mrs. Wilson, the President's wife, is not above making a cake or a batch of corn muffins, helps me to see true dignity in my own work."

Mrs. Wilson finds herself in true sympathy with legislative reform which shall secure improved conditions for working women and children. She has never taken any positive attitude either for or against woman suffrage, but she does believe in an ultimate higher destiny for women. The women of America may feel that they have in Mrs. Wilson a friend who will be true to their interests.

Both the President and Mrs. Wilson understand and share the aspirations of the American people; and it is their desire that the popular will shall be truly interpreted. When we think of the White House we need not have in mind its splendid material effects, but rather the spirit which governs those who dwell there. This article would not be worth printing if the great mass of American people did not hold the hope that the present Executive in the White House and those associated with him by close ties are to dedicate and consecrate all their energies to the welfare of the whole people, socially, industrially and educationally, as well as politically.

The machinery of our government is so big and its organization so complex, that the nation's head must be a man of unusual resources, vigor and patriotism, in order that any marked degree of permanent improvement can be made in our institutions.

President Wilson deserves a fair trial. May he acquit himself in such a manner that future historians may write a favorable verdict.

Cleveland, Ohio.

The Coming of Love

By Arthur Wallace Peach

Cometh Love, a herald,
With sounding, brazen horn?
Love cometh like the silence
Beneath the feet of morn.

Cometh Love in purple
Or golden raiment clad?
More like a pilgrim shyly,
Or wistful beggar-lad.

Cometh Love at noon-day,
Piping high and shrill?
Love cometh like the twilight
To haunt of woodland rill.

Cometh Love, a victor,
His shield with flaming boss?
Love cometh not in armor,
But crown of thorns and cross!

Brattleboro, Vt.

THE NEW BOOKS

The Greek Genius

A most readable book is that of Mr. Livingstone on *The Greek Genius*.[1] The writer, an Oxford fellow, is a scholar alive to his work and insistent upon the excellence of his field—the Greek tongue, its records, and the genius of the Greek people, as evidenced by their master minds of the period 600 to 400 B. C. He finds a foundation for his faith in the Greek human nature and love for beauty, for truth, for freedom in thought and expression of thought. The Greeks were more sensitive to beauty in all its manifold forms than other nations of their or of our times. Yet they were not Bunthornes, nor did they love the esthete, or care for art as art in those early days. To them an essential of beauty was simplicity. In poetry, painting, sculpture, they gave the picture as it was, tender, true to fact, impressive, without expanding the emotional. That should be supplied by the reader, the onlooker. Tho they were gifted liars, they loved truth as few people have loved it. That is, in Mr. Livingstone's interpretation, "They knew how to look straight at life and see it as in fact it is." Living in age of undeveloped science, with more mysteries in their surroundings than we are permitted to explore, they took "quite as reasonable a view of the world as we do." They had also the true note of freedom. They left all questions open for discussion, even the question of the "unknown god." Putting Socrates to the hemlock test was only a mild exception to this rule. They had inherited views of their gods, but being well aware that they were more or less anthropomorphic, they added freely to the inheritance, adapted the divine to their own condition and circumstances, multiplied the invisible inhabitants of earth, air and water to suit themselves. They had no Bible to say "Thou shalt" and "Thou shalt not." The responses at Delphi and Olympus were inconsistent with one another, and neither was altogether inhibitory, so the Greek mind was free to roam about within the confines of a large area of guesswork. The gods themselves had their human infirmities. If a Greek loved wine only too well, it was the god Bacchus who led the procession. If he loved in his own way, was not Venus to blame? Did not Mercury steal? Was Jupiter altogether impeccable? Thus the Greek built into his daily life his own interpretation of restraints. "The Jew submitted to tradition; the Greek trusted to himself and his reason." And he built so well that he supplied the Christian Church with much that was good and much that was bad in the way of forms and ceremonies, and the world with ideals in art, architecture, poetry and historical narrative, in philosophy, in government. These are a few of the author's ideas, stated briefly. His argument is ingenious; his illustrations apt and full. To the Greek love for beauty, truth, freedom, he adds directness of humanism, essential sanity and many-sidedness. Occasionally a modern touch enlivens his illustrations. "Consider," he says,

> the casual, unpremeditated expression of the Greeks and see how an unconscious grace informs them. No doubt Mr. Roosevelt's emotions when he saw New York after his travels round the globe were much the same as those of Xenophon's soldiery when after their wanderings in Anatolia they caught sight of the familiar sea; yet there is all the difference in the world between their respective exclamations, "Say, boys, that's bully," and "Thalatta! Thalatta!"

A less readable book, but of quite as much value to the student of Greek poetry, is that by John Williams White, now for a long time professor of Greek at Harvard, and everywhere honored as one of the devoted scholars, after the German fashion, in that ancient and much abused tongue. *The Verse of Greek*

[1] *The Greek Genius.* By R. W. Livingstone. Oxford: The Clarendon Press. 6 shillings.

Comedy[2] deserves the attention of every student who feels that the metrical structure of Greek poetry had a closer connection with song and dance than has the metrical structure of modern melic and dramatic verse. The comedy of Aristophanes, for instance, was written not for the actor alone, but for the lutist and dancing master, for the strolling minstrel and the festal bard. The music of it is lost, but the vocal training for the singer and the actor, in every line of his art, is to be recovered only in the careful study of prosody. Professor White takes up the study of those troublesome feet—the iambic, trochaic, choriambic, logaoedic, etc., as if he keenly felt the joy of the light hearted people dwelling around the Ægean Sea and beat the march with them, when they walked in procession, with the thyrsus of Bacchus, or the dove of Venus, or the emblem of some more sober god at the head of the line. He is ready to show how they sang, danced, fingered the harp, kept step to the war drum. To the student of manners and ceremonial his pages are more interesting than they look. We in America have arrived at the stage when every young poet is giving attention to his artistic forms, when he "manifests special disposition to vary his rhythms by means of abnormal forms." He should know that he is really on the alert for some of the prosodiac-enoplic abnormalities of the poet Bacchylides when he thinks he is only following in Walt Whitman's footsteps.

It is always a pleasure to trace an author's bias to its origins, to track out a quotation, to run a good story down to its earliest burrow, and Plutarch has given many a lover of great men a choice run at the game. Tho with a little of the tang of the classroom in his otherwise admirable rendering of Plutarch's *Nicias* and *Alcibiades*,[3] Professor Perrin is an engaging guide in Greek history, connecting two great men of Athens with a vital period of the Peloponnesian War, and tracing Plutarch's gossipy narrative to its various sources.

The "Universality and Permanent Power of Greek Literature" is the general theme of ten lectures delivered at Columbia University in 1911 by as many able lecturers called in from various quarters.[4] The keynote is set in the first lecture, by Professor Shorey, of Chicago, when he says:

> The world of scholarship is large enough to maintain every type of specialist. But the student of human letters must be on his guard against the specialist's distorted perspective.

Here is a note which brings us back to Homer, away from the "perfected harmonies of the hexameter" and their "embryonic evolution." In this spirit we have Homer's simplicity, variety and perfect naturalness well elucidated by Professor Shorey; epic poetry rather flowerily characterized by Professor Smyth, of Harvard; lyric poetry in its well preserved works and its beautiful fragments happily summarized by Professor Perry, of Columbia; and tragedy fittingly illustrated by Professor Wheeler, whose account of the three masters—Æschylus, Sophocles and Euripedes—is a fine study of the "sublime imagination" of the first, that "lifts him to a region where the great forces of the universe seem to be close about him"; of the "good sense" of Sophocles, "a man of the world"; and of Euripides, "prophet of a new era."

A well stored mind, whose fancy plays chastely and sweetly in English, Latin and modern Greek verse, was that of Mortimer Lamson Earle,[5] whose death in 1905 removed from the narrow circle of ripe scholars one of the best. His friends, with perhaps too kindly a gloss on the lines of his life as an intellectual man, have brought together and published his fragmentary work, which had to do mainly with philological comment on the Greek and Latin classics. The fragments make a most respectable showing for what our students of the ancient languages could do, if the American spirit allowed them to turn oftener to textual criticism of the continental order and fervor. One might speak of the textual and interpretative criticism as sometimes

[2] *The Verse of Greek Comedy.* By John Williams White. New York: The Macmillan Co. $4.

too much in the nature of guesswork, inadequately supported by convincing reasoning. The notes on Euripides, for instance, and certain proposed emendations of approved texts, would suggest such a view, if the notes were intended to be more than hints. The emendations are certainly bold, and follow lines of individual taste rather than of judicial detachment. The American touch is light; the German, an exhaustive draft at the lips that are never withdrawn from the bung. In the fragments of work by Professor Earle, a rare scholarship and a fine sense for poetry are everywhere in evidence.

The Lyric South

A Southern woman who remembered the ante-bellum days once told the reviewer that she had heard a boy of ten or twelve say to a little girl as he was about to escort her home from a party one dark summer evening: "We shall need no other light than that shed by the stars which shine in your eyes." This is in precisely the same vein as Pinckney's poem, *The Serenade,* which is included in Mr. Walter Neale's *Masterpieces of the Southern Poets* (Neale Publishing Company), beginning:

> Look out upon the stars, my love,
> And shame them with your eyes.

Alas, the old cavalier days are dead and gone, and a certain courtliness of compliment which gave aristocratic distinction to its slender and exotic art, has disappeared from Southern poetry. And yet some persistence of the manner and of the mood is still to be noted in the fanciful and sentimental exuberance, even excess, which marks the expression of the later Southern poet whether he is writing of nature or of God, or, as in the case of Lanier, of both. That poet's inspiration, which is really aspiration, and which rises in iridescent mist from his marshes, bears much the same relation to the graceful muse of Pinckney, as Crashaw's stream of Catholic incense bears to Carew's strings of coral and pearl. Of Father Tabb it may be said that he is the Herrick of Southern poetry, in that fineness of form and epigrammatic concision of statements fix even his frailest fancies, while an ill-disguised background of moral gravity and of human tenderness makes many a word lightly spoken, many an image gaily projected, awaken some inexplicable response in the heart itself. Then, for a third poet to support our suggested parallel which would connect the poetry of the South with that of England in the seventeenth century in its development, we may mention Julia Neely Finch, whose remarkable and beautiful meditation on *The Unborn* is indeed a "masterpiece." In it the writer shows no small share of Donne's power of spiritualizing the processes of the flesh, of penetrating the physical world with a metaphysical emotion, thru the very audacity of a series of conceits which deep personal feeling and admirable artistic restraint render in the highest degree natural and nobly imaginative.

For the rest, the collection (if we expect the poems of Poe, who is only half a Southern poet) contains little that is of especial note. Most of such success as has been achieved lies on the lower levels of inspiration where the personal or local element frankly predominates. The attempt to attain a wider universality has usually led the Southern poet into rhetorical displays and into dreary didacticism. Perhaps for the general reader the most interesting discovery afforded by the book will be the fact that Thomas Jefferson wrote a pretty poem in the artificial manner of the eighteenth century, to "Lovely Peggy," and that this was the original for Paul Leicester Ford's "Concerning Thalia," in *Janice Meredith.*

Fields, Factories and Workshops

Those of us who have been frightened in our youth by that bogie man of orthodox economics, the necessary centralization of production and the impending doom of all small-scale industry even in agriculture, may take heart from Prince Kropotkin's practical little tract, now appearing in a revised edition fourteen years after its first publication (*Fields, Factories and Workshops;* Putnam, 75 cents). The author bases his conclusions, not upon abstract theory or personal impressions, but upon official statistics and the reports of actual experiments in intensive agriculture and handicraft revivals. He finds, for instance, that 24 per cent of the industrial workers of England are working in workshops having less than eight to ten workers per establishment. The reaction from excessive specialization is in full swing everywhere in industrial countries. Attention is being turned from production for foreign markets to production for local use, as one country after another becomes a producer of manufactures. Even China, according to the author, "will never be a serious customer to Europe: she can produce much cheaper at home; and when she begins to feel a need for goods of European patterns, she will produce them herself." Kropotkin believes that "the true consumers of the produce of our factories must be our own population," and that only the poverty of

the great mass of the people keeps them from being in a position to afford a market for the manufactures of any industrial country. Much is also to be hoped from a judicious union of agriculture and industry, and even more from a close alliance between the theoretical science of the schools and the applied science of the factories.

The Arts of Friendship and Letters

The first volume to appear in the second series of the Humanists' Library (Boston: D. B. Updike, The Merrymount Press; $3) is the *Correspondence* of Hubert Languet and Sir Philip Sidney. Sidney's *Defence of Poesie* was issued in the first series of this library, and the choice of this correspondence as a subject for its sequel is in all respects fitting; not least because of the relative rarity of the Pears translation, published in 1845. But the editor, Mr. William Aspenwall Bradley, may well have chosen this correspondence by reason of its illustrating the kindred arts of friendship and of letter-writing; while Mr. Bradley, Mr. Einstein (the general editor of the Humanists' Library) and Mr. Updike have collaborated in producing a work which illustrates a third art—that of typography. The type used here is the Montallegro: an aptly named font designed for the Merrymount Press by Herbert P. Horne, of London, a font which the *Burlington Magazine* has praised for equal beauty of effect and of detail, "beauties which might not unjustly be termed Raphaelesque for their singular balancing of strength, grace and fine tradition." This admirable series of books is printed on a hand paper especially made for the edition, and the new volumes are to be of uniform size (6¼ x 9¾ inches), uncut. Among the titles promised are Dürer's *Journeys to Venice and to the Low Countries,* Pico della Mirandola's *Platonick Discourse upon Love,* and Giovanni della Casa's *Galateo.*

Mr. Bradley contributes to the volume before us an admirable essay on the friendship of the Protestant controversialist and the English gentleman. Languet was fifty-four and Sidney but eighteen when they met at the house of Andreas Wechel, the Frankfort printer, in 1572; but Greville had already, in meeting Sidney at Oxford, received his impression of him as a youth distinguished by "staidness of mind." The letters exchanged by Languet, the Burgundian, and Sidney, the mirror of England at its best and purest, were written in Latin; but Sidney's contribution is characterized by Mr. Bradley as "the first modern letters written by an Englishman." Languet's interest is, preëminently, that of the pedagog, proud of his pupil and fond of him as well; Sidney is, at the outset, the affectionate and well-born schoolboy. "You will be employing yourself well and usefully," writes the elder of the correspondents, "if you practise writing diligently while you are absent from your home"—for Sidney was in these early years (1573-1574) making the Grand Tour so essential to the education of English youth in the sixteenth century—and the seventeenth and eighteen no less. Languet recommended the practice of letter-writing that his young friend might "keep up any friendships" contracted abroad; friendships to be valued both for sentiment and profit. And when Sidney inquired how to improve his style, he recommended Cicero's letters, "not only for the beauty of the Latin, but also for the very important matter which they contain. . . . Many persons think it very useful," he continued, "to take one of his letters and translate it into another language; and then to shut the book and turn it back into Latin; and then again to refer to the book and compare their expressions with Cicero's." All the same, he warned his pupil against the danger of deeming imitation a virtue in itself: a warning timely in the age in which he uttered it. "I intend to follow your advice about composition thus," replied Sidney; "I shall first take one of Cicero's letters and turn it into French, then from French into English, and so once more . . . into the Latin again. Perhaps, too, I shall improve myself in Italian by the same exercise." Nor do we doubt that Sidney carried out this arduous exercise. He was a diligent youth, and did not exaggerate when he described himself as more sober than his state and prospects really required. Even at eleven years of age he had exchanged letters in Latin with his noble father.

It is fashionable to date cosmopolitanism from the period of Jean-Jacques, or from Madame de Staël's work, *De l' Allemagne*; and it is both diverting and instructive to receive light upon that earlier cosmopolitanism which marked the century of the *Arcadia.* Many of Languet's letters are stilted; nor are Sidney's all so free or modern in spirit as Mr. Bradley's agreeably enthusiastic introduction might lead one to suppose. Yet we applaud the performance, and value the worthy reprint.

Out of the Wreck

It is a curious fact in the psychology of fiction makers that only women novelists have the courage to select a cad for a hero. Charlotte Brontë gave us two of them—Rochester in *Jane Eyre* and Moore in *Shir-*

ley. Mrs. Humphry Ward in *Eleanor* described a particularly unpleasant specimen of the genus, and Miss Beatrice Harraden in her latest novel, *Out of the Wreck I Rise,* presents another "little, obstinate figure," that of Adrian Steele, who is not only little and obstinate, but dishonest in business and dishonorable in love. The reader wonders why a writer should represent her women characters as devoted to such men, but that is doubtless because the novelist has seen women, even fine women, loving in real life just such monsters of selfishness and cruelty. One of the two misguided characters who love Adrian Steele in *Out of the Wreck* is a high-minded social worker; the other is a dealer in jewels and antiques.

Miss Harraden finds her title in Browning: "Out of the wreck I rise, past Zeus, to the potency o'er him," but we cannot see that he does rise—he rather evades the issue, and leaves others to bear the sorrow and disgrace. (*Out of the Wreck I Rise,* by Beatrice Harraden. New York: F. A. Stokes Company, $1.35.)

Literary Notes

Harrison S. Morris contributes a tactful outline of the life and art of *William T. Richards,* the painter of seascapes. There are numerous illustrations (Lippincott, $1).

A touch of irony is suggested in the publication of a work of Julian Hawthorne's in translation in the *Bibliothèque Cosmopolite* under the title *Confessions d'un Condamné.* In one of the reviews of this book we read that "the author has edited the notes of the man who spent five years in Auburn Prison, New York State," and that his book contains "remarkable evidence of the corruption of the American police."

A monthly magazine has been founded in the interests of *The French Bulldog.* This periodical, which bears the name of the breed, made its debut in January, and the first issues are interesting, authoritative and handsomely printed (1 Liberty street, New York, $1.50 a year). The French Bulldog Club of America, the publishers, announce a specialty show in New York for April 18 and 19, at which for the seventh time their increasingly popular animal will have things all to itself.

The seriousness with which the Germans take Nietzsche is shown by the appearance of a thoro study of Nietzsche's work in relation to the philosophical, esthetic and literary movements of his time by Prof. Richard M. Meyer, the biographer of Goethe (Munich: Oskar Beck). The author draws upon the literature of all nations for illustrative quotations and comparisons so the work will interest many who are not Nietzsche-lovers. It might well be translated since there is nothing like it in English.

Another story of the entertaining people engaged in the cloak and suit business, *Elkan Lubliner, American,* comes from the pen of Montague Glass (Doubleday, Page & Co., $1.20). Here is a remarkable account of the ease with which a raw youth of fifteen, when he comes from Russia, learns a trade, a language and the commercial habits of a country. The inimitable dialect, the sly humor and the underlying sympathy of the earlier books are all here.

The third and concluding volume of Prof. Hartmann Grisar's great work on *Luther* (St. Louis: Herdersche Verlagshandlung, $5.50; three vols., $13.50) has the descriptive subtitle *Am Ende der Bahn.* While the general view of the Reformer is not materially altered by the author in this last volume, there are many answers and some concessions to the critics of the earlier two. As a whole this constitutes the most scholarly and impartial life of Luther written from the Roman Catholic standpoint.

The Yale lectures by Dr. J. H. Jowett on *The Preacher, His Life and Work* (Doran, $1.25) are full of suggestion and inspiration for the aspiring pastor. Dr. Jowett's devotion to the peculiar tasks of the ministry, his notable success in his pastorates and his mastery of style give him special qualifications to speak with effectiveness on some of the profounder and more difficult phases of the minister's work. The author's enthusiasm is contagious, but every lecture seems to emphasize the fact that there is no royal road to success in the ministry of today except that of patient toil and loyal service.

From the Seminary Press, of London and New York, we receive the initial number of a monthly magazine, *Faith and Doubt,* whose scope is sufficiently indicated by its name. Among the contributors to this number are theological teachers and others of Europe and America; and the letter from Prof. Caspar René Gregory, who defends the German pastor, Jatho, against the court which condemns him for heresy, illustrates its breadth, while other scholars either attack or defend the doctrine of the virgin birth of Our Lord. Among American contributors are Harriet Prescott Spofford, Prof. A. A. Berle, Prof. George E. Horr, Rev. William E. Barton, and Henry Clews (by interview). The value of this monthly will depend on the competency of its editorship, but it is sure to contain articles of real interest and value ($1.50).

Drawn by C. R. Weed.

THE CALAMITY-HOWLER:—"Why, this Wilson-man has no regard for precedent! He's not satisfied with reading his own Message to Congress, but he threatens to carry out the Democratic platform!"

SURVEY of the WORLD

A Home-Made City Park

The little city of Monrovia, California, owns 4000 acres of water-bearing land in the canyons at the base of the Sierra Madre Mountains just back of the city. This land includes mountains, canyons and mesas and for years was almost inaccessible.

Recently the trustees of the city were asked by the canyon guard for an allowance to erect some convenient resting places for picnicking parties and visitors. The response was prompt, but the allowance small, owing to a depleted treasury out of which a large sewerage system and much street improvement work had been done.

W. N. Monroe, founder of the town, who is now superintendent of water supply, together with Thomas Harkness, canyon guard, set about devising ways and means to beautify the city's property, with the result that six months later one of the most inviting and magnificent open-air playgrounds on the Pacific Coast was owned by the city and attracting people from all parts of the country.

The work was accomplished by setting aside certain days as "Canyon Days," on which the whole town turned out to donate a day's labor or gave two dollars in lieu thereof toward accomplishing the work. Women, men, children from all walks of life joined the forces, worked willingly with pick, shovel, saw and axe. Dinner was served on the grounds by the women. Roads were built, bridges erected, comfort stations and fireplaces built, and faucets attached to water mains for the convenience of camping and picnicking parties. A ten-acre tract on Emerson Mesa was cleared and a swimming pool for the boys constructed; a mountain library, to contain several hundred volumes from the public library in Monrovia, and a big refreshment pavilion of granite are also planned.

The water supply of the city comes from this land and every precaution to prevent pollution has been taken. A conservative estimate of the value of the playground to the city, made by a Los Angeles capitalist, was $25,000. Citizens have done the work themselves and have enjoyed the outings on "Canyon Days," when the banker, blacksmith, merchant and professional man labored side by side with Boy Scouts, schoolchildren and ministers. Other small towns may do as much with almost any kind of land nearby and easily solve the problem of health and recreation.

Transparent Metals

While it has been known for years that thin sheets of gold and silver, mounted on glass, may be made transparent by heat, it is only within recent years that serious study has been given to the conditions under which transparency may be produced.

A sheet of gold one three-hundred-thousandth of an inch thick becomes transparent when heated to 550° C. The transparency is ascribed to the gold aggregating and allowing white light to pass thru the interstices.

With silver one one-hundred-and-twenty-thousandth of an inch thick no transparency is produced so long as the atmosphere is a "reducing" one—such as hydrogen or coal-gas. But in the air the transparency begins at 240 degrees and is remarkably complete at 390 degrees.

Copper one seventy-five-thousandth of an inch thick does not become transparent in a reducing atmosphere, but in air it is transparent between about 200 degrees and 400 degrees. At the lower temperature the light is a brilliant green, but as the temperature rises oxidation takes place, and the color ranges thru olive and dark red to black.

Farming on Volcanic Ashes

At the time of the frightful volcanic outburst in the Antilles in 1902-03, when the city of Saint Pierre was destroyed, there were also extensive eruptions of the Suffrière Volcano in the island of Saint Vincent. Incandescent avalanches burnt off all the vegetation on the slopes of the mountain and in the surrounding district, and covered the land with ejecta, which, on level ground, lay from one to three feet thick.

Now all the lower lands are fairly well covered with bush, and are being rapidly converted into arable soil. On the windward side of the island these tracts have been in large measure reclaimed, altho so few years have passed, and are under cultivation in sugar cane, cotton, arrowroot, pigeon peas and other crops; but this has been accom-

plished only by deep cultivation thru to the underlying old soil, which was thus mixt with the ash. The addition of large amounts of organic matter is necessary, however, in order to maintain fertility. This is done by means of manure or of leguminous plants, which can be made to grow luxuriantly. It is interesting to note that the increased fertility observable in many places is to be attributed to partial sterilization of the soil, by the hot ashes spread over it. This would lead to an increase in its available nitrogen compounds, which in turn would stimulate the vegetative growth of any plants whose roots could reach it.

The abundance of nodules on the roots of these leguminous plants is evidence that the nitrogen-collecting bacteria were not destroyed in the old soil; or else that they were reintroduced with the planting material that was used, and, finding partly sterilized soil, and therefore an absence of enemies, were given the best chance of increasing their numbers. It has been largely due to this fact that planters have been able to obtain such excellent crops, particularly of the pigeon pea, which they could utilize as a valuable green dressing material.

Ants That Cook

The extraordinary habits of the harvester ant have long been known to naturalists. Certain species not only harvest and store in granaries the seeds upon which they feed, but actually plant and cultivate an annual crop of their food seeds.

Still more remarkable stories are told of an ant that is common in Dalmatia, the *Messor barbarus*. According to Dr. Neger, of the Dresden Forestry School, this ant not only cuts leaves and gathers seeds, but actually makes bread or biscuit! The seeds are first sprouted, then carried into the sun and dried, then taken back to the underground chambers, where they are chewed into a dough. The dough is then finally made into tiny cakes, which are baked in the sun, then carefully stored for future use.

From these observations it would appear that the art of cookery is not confined to the human race. All cooking is done by the sun, whether in the ripening of fruit or in the baking of bread in a stove. The heat obtained from fuel is simply stored up sunlight set free.

The Arab and the native Mexican speak of ripe fruit as fruit which has been cooked in the sun. The ant has somehow learned the art of sun cookery, the saliva with which it moistens the grain probably taking the place of yeast and sweetening thru changes set up by its influence upon starch.

Care of Feeble-Minded Children

The newspapers which have been discussing at great length the condition of the New York schools appear to have lost sight of one very important subject which has been under investigation during the past year. That is, the proportion which the number of the feeble-minded in the city schools bear to that of the normal children, and the adaptation of the present school system to their care. This investigation has been conducted by Dr. Henry H. Goddard, head of the Department of Psychological Research at the Vineland Training School for Feeble-Minded Children.

It appears that in the public schools of New York City there are 15,000 feeble-minded children, or 2 per cent of the total number of school children, and that the ungraded classes in the schools at present provide for only 2000 of these. As a result, feeble-minded and normal children are often taught together in the same classes, an arrangement, which is obviously bad for both. While the feeble-minded child can learn a manual or vocational subject, it cannot master the ordinary subjects of the public school curriculum. On the other hand, normal children are handicapped by the presence of these defectives. Parents have a horror of institutions for the feeble-minded, especially of the one at Randall's Island, which for many years has borne, whether rightly or not, a bad reputation. He therefore recommends the establishment of separate schools for them under teachers especially trained for the purpose. These schools may, he thinks, be made attractive enough to overcome the objections of parents, and may ultimately become city institutions for defective children.

Such a course seems only a half-way measure to those who have devoted their lives to the study of this question, but they are aware of the danger of outrunning public opinion. The uproar raised in England against the Mental Deficiency bill as an attack on individual liberty shows how unprepared the public is for radical changes. The opposition, to be sure, was manifested chiefly outside Parliament. In Parliament, where it was supported by members of both parties, it was dropt only from pressure of business, and the Government has promised to reintroduce it this year. But it is by no means certain to pass, so great is the popular fear of compulsory segregation even in qualified form.

Dr. Goddard's recommendation therefore seems to them most wise. It accomplishes the main purpose without appealing to the strong arm of the state.

A Roofless Coal Mine

In the past fifteen months a curious method of mining shallow-lying coal has grown to huge proportions in the two southeast counties of Kansas, one of the bituminous districts of the United States. Steam shovels are used to strip off the earth from

MINING COAL IN AN OPEN CUT IN SOUTHEASTERN KANSAS

the fuel, which is left bare so real miners, lacking only their little cap lamps, can remove the coal with pick and shovel in broad daylight. In such mines there is no danger from rock falls, black damp or gas explosions, and that greatest of terrors to the underground worker, fire. The "roof" is the blue sky.

Two of the shovels in use are by far the largest in the world; and they are digging trenches at the rate of 25 feet a day across the unbroken prairie 20 to 30 feet deep and 100 feet wide to each machine. The great ridges thrown to one side by these giant shovels, which bite off five ordinary wagon loads of earth at one dip, look at a distance like mountain ranges. Two dipperfuls are lifted each minute by each machine, and in one day they load 700 tons of coal into railway cars. The coal vein being worked now is approximately 36 inches thick. Twenty shovels are in use; and many miners who have given up dangerous underground work are engaged in "sunshine mining."

Pellagra

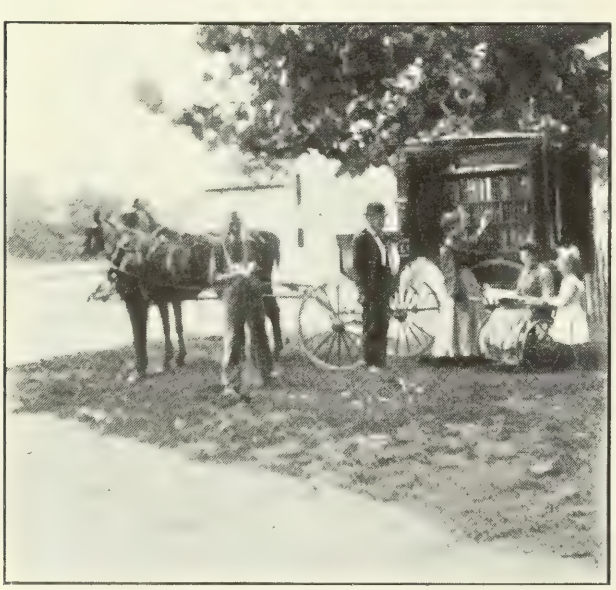
The disease pellagra was first reported from Spain nearly two hundred years ago. By the beginning of the nineteenth century it was widely distributed over Italy and France. It is now found practically over all the tropical and warm temperate areas of the earth. Five or six sporadic cases were reported in the United States prior to 1906, but since that time its presence over the entire South and sporadically in nearly every State of the Union has been demonstrated. Just how long it has existed in our South is unknown, but it is an undoubted fact that the disease is increasing at an alarming rate in the Southern States.

The disease was first diagnosed as a food poisoning, allied to ergotism or beriberi; and Indian corn was blamed as the malefactor. But the idea that Indian corn caused pellagra, because it was deficient in nutritive principles as a human food, had to be discarded when chemical analysis showed it to be rich in fats and nitrogenous materials. Moreover it is easily digested. Then spoilt corn, it was said, caused the poisoning and various bacteria and molds came in for their share of the blame. The action of the colon bacilli on ingested corn was said to cause the toxic effect and even corn smut was under suspicion. Since the hands and face and other exposed parts of the epidermis are early irritated, it has been suggested that the toxic effect of the corn was ineffective until acted on by the chemical rays of the sun.

Opposed to the maize theory is the fact that corn has been used for generations as human food over vast areas without causing the disease. Moreover, people have had pellagra who did not eat Indian corn. Various insects are accused of being the transmitters of the disease. The buffalo gnat or some other species of gnat has been most strongly accused. Nematode and other worms of stagnant water, as well as some species of ameba, have also been under suspicion. The real cause is still unknown.

The disease is no respecter of race, age

or sex, altho it occurs more frequently in women. Alcoholism, the stress of motherhood, poverty and poor digestion are the frequent antecedents of pellagra.



Whatever the cause or causes of the disease may be, it is one characterized by profound disturbances. The muscular system wastes away, the alimentary tract is constantly disarranged and the skin becomes irritated, often to a loathsome degree, and finally the nervous system, sometimes early in the progress of the disease, is so affected that the mind is destroyed.

Considerable progress has been made in the last three or four years in the treatment of the disease. When discovered in its earliest stages a cure is sometimes effected. The treatment is practically the same as for tuberculosis, namely, rest, pure air, nourishing food and body cleanliness.

Rural Free Delivery—of Books

What is known as the "book wagon" has become a familiar sight thru Washington County, Maryland. It is a welcome visitor to the 30,000 rural inhabitants of the county, for it supplies them with free books from the public library of Hagerstown, the county seat.

When the plan for a free library in the county was first brought up the public-spirited people decided to have it serve the whole population instead of a few in the largest town. But just how to get the books to the country districts became a problem. After depending upon the farmers to take cases of books out to the deposit stations for a year or two, it became evident that if this library was to be as vital a thing to the rural residents as to the city dweller, it would be necessary for them to have their own conveyance. So a specially built bookcase was constructed on a wagon, and for the last three years it has traveled over the country, leaving cases containing fifty books each at sub-stations and along the route, serving the people at their homes direct from the book-shelves of the wagon.

THE "BOOK WAGON"
It carries reading matter from the free library at the county seat to the farmers of Washington County, Maryland.

The schools are supplied with cases of books suitable for the children, and to this service the librarian has added the distribution of pictures, of which the library has a good supply.

Miss Mary L. Titcomb, the librarian at Hagerstown, is enthusiastic over the success of the work and the appreciation shown by the families, and she is aiming high in her plans for its development.

Hardening Steel by Electricity

Like the widow's cruse, the uses to which electricity may be put are never exhausted. It has now been successfully applied to the process of hardening steel. Hardening various combinations of iron alloys that may be tempered is no easy task. The cost and trouble often run the price of the finished product unreasonably high. Tools that should be available for everybody are thus kept out of the reach of the very persons who need them most.

Comes now the new electric method which maintains the furnaces at such uniform temperatures that the best possible results must follow. The popular methods of gas, coal and oil heating forbid the expectation of steady heat; fluctuations are inevitable. Irregular, spotty heating, with underheating at one point and too much heat at another, is the rule. The consequence is that tools are sometimes properly hardened and sometimes not.

There is the lead bath process, for instance. Sudden application of too much or irregular heat causes internal strains which produce cracks and crevices. The tools are lighter than the liquid lead, and hence float on top of it. The dross as well as the lead which then adheres to the tool interferes greatly with a uniform output, and the toxic gases which are associated with this manufacture work great harm to the men.

The new methods, including the electric furnace, result in hardening according to scientific rules. The heat can be regulated without trouble and maintained uniformly at any point in a very wide range. Metallic salts, melted by the pasage of the electric current thru them, produce a solution which keeps constant temperature. The temperature depends on the amount of the current;

the change of one causes a change in the other. Any tool dipped into the liquid at a fixt temperature will soon come to the same temperature and thus become hardened as you please.

Carbon steel requires from 1380° to 1832° F. It is obtained by baths of chloride of barium and chloride of potash. The variations in the proportion of one of these metallic salts to the other also vary the fixt temperature of the solution. The barium salt raises the temperature, while the potassium diminishes it. Common tool steel requires equal parts of each by weight.

Barium chloride is used by itself if a high-speed steel is to be tempered; 2372° F. may thus be steadily maintained with the electric current. Only salts of the highest purity must be used; otherwise flaws and cracks may be found in the final product. At either side of the crucible are two iron plates which take the place of electrodes, between which the current runs thru the bath. They must be changed from time to time, because the heat soon destroys them.

A sixty cycle alternating current with a transformer is used with these furnaces. The 220 voltage may thus be reduced to a volt or two. In addition to the transformer, there is a regulating device which allows the current strength to be changed for appropriate temperatures.

Girl Plumbers

The girls of the Hollywood High School, in the suburbs of Los Angeles, Cal., are being given a course in practical plumbing during this school term. The girls are delighted with the innovation, many of them being more interested in the plumbing course than in their other studies.

To some persons it may seem strange that soft hands whose most strenuous work heretofore has been the embroidering of college pillows, or making attractive middy suits, should turn with so much enthusiasm to iron wrenches and dripping, splashing hydrants, but the girls argue that a capable housewife should be able to repair the leaks in her kitchen, if necessary, and read her water meter intelligently to know whether her bills are correct or not.

Their teachers agree with them. And the result is a course that will enable California housewives to stop escaping gas and clean congested sinks and know the difference between the use of granite and aluminum to save unnecessary expense, and generally to extend their ability as expert housekeepers.

That is the principle on which these energetic schoolgirls are proceeding in their course of soldering pipes and inserting washers and other branches of practical plumbing. And the large and growing number of names enrolled in the class is the proof of its extraordinary popularity.

LEARNING TO PLUMB

This novel addition to their curriculum is very popular among the girls of the Hollywood High School, near Los Angeles.

Baltimore's Municipal Journal

One of the most conspicuous, if not important, innovations of Mayor James H. Preston's administration at Baltimore is the publication of the *Baltimore Municipal Journal,* an eight-page semi-monthly, which made its initial bow with the issue of January 17th last.

No little opposition, both in and out of council, developed against the journal when an appropriation of $5000 for this purpose was placed in the budget for 1913, the three principal objections being:

1. That the publication would be used as a party organ to exploit the present administration.

2. That it could not be made to serve any purpose that the daily newspapers do not already serve.

3. That it would therefore entail an unnecessary expenditure of the taxpayers' money.

Mayor Preston, in his salutatory with the first issue of the paper, said:

"It is not intended to take the place of the newspapers,—it is not intended to decry, criticise or praise,—but to contain in detail the municipal items given to the daily press; and in addition, those matters which are of interest to the citizens and the taxpayers, tho, perhaps, not of interest to the casual reader. We hope to give a concise, impartial and sincere statement of the vast work of the municipality, so that the great body of citizens, interested in knowing what is going on in the various municipal activities from day to day, can find a record thereof in the pages of Baltimore's *Municipal Journal.*"

Without attempting at this time to answer the objections, let it be said that as to the first it would not require a prophet to forecast the speedy doom of the publication with the first attempt on the part of the present or future administrations to make of the new publication a party organ. Indeed, it is quite disappointing to some of the opponents of the present administration that no such attempt has been made from the beginning.

As to the second and third objections, it certainly must be of interest to the taxpayers of any city to know at all times what is being done by its public servants. The *Baltimore Municipal Journal* publishes the facts of interest to the taxpayers pertaining to the operation and management of the city government; it gives brief accounts of the municipal projects of the mayor and his cabinet as discussed at the mayor's weekly cabinet meeting, the daily activities of all of the city departments, the proceedings of the Board of Estimates, the transactions before the Board of Awards, which awards contracts for work and supplies, the proceedings of the City Council and all other boards or commissions connected with the city government. All of these matters are, of course, commented on in the daily newspapers according to the available space, but they are also of sufficient interest to a great and increasing number of citizens to warrant the publication of full reports on what the public servants are doing and how they are doing it frequently instead of annually. It is undoubtedly true that public interest in municipal affairs has had a great awakening, and this determination on the part of Mayor Preston to let the public have the ungarnished facts twice a month has been favorably received by the majority of the interested citizens and taxpayers. Already Baltimore's *Municipal Journal* has over 1800 paid subscribers.

The publication of such a journal, while new with Baltimore, is not an untried proposition. The following cities, and perhaps others, have made the experiment: Boston, Centralia (Ill.), Chattanooga, Colorado Springs, Denver, Houston, Los Angeles, New York, Philadelphia, San Francisco, San José (Cal.) and Tacoma.

One of the best examples of the wisdom of publishing such a journal is that furnished by the *City Record,* published by New York City. Comptroller Prendergast, of New York City, said in a recent letter to Comptroller Thrift, of Baltimore:

"Forty or fifty years ago all the city advertising was done through the newspapers. If that were done now, the annual cost would be in the neighborhood of one million dollars. The actual cost of advertising printed in the newspapers now is about $225,000 per annum, $100,000 of which is statutory. The balance of the advertising is covered by the *City Record.* The cost of publishing the *City Record* is about $130,000 per annum, including the supplements."

Two plans in connection with Baltimore's *Municipal Journal* are now contemplated:

1. The establishment of a municipal printing plant for the printing not only of the journal, but of the city's multitudinous forms, contracts, specifications, departmental annual reports and the weekly journal of the proceedings of the City Council.

2. The publication in the *Baltimore Municipal Journal* of the city's advertisements, as is done by New York City in the *City Record,* instead of in the newspapers.

WILLIAM TALBOT CHILDS,
Deputy Comptroller of Baltimore.

Saccharin Smuggling

For centuries daring smugglers have evaded customs officers with jewelry, opium, silks and a thousand different articles on which the import duty was high.

It is only within the last ten years, however, that smugglers have turned their attention to saccharin—a coal tar product several hundred times as sweet as sugar. In 1902 Germany and Austria forbade the manufacture or sale of this substance, believing it somewhat injurious, but more influenced by its keen competition with the beet sugar made in enormous quantities in those countries.

The German and Austrian housewives, however, believe saccharin is harmless and insist on using it because it is so much cheaper than sugar. It is really not cheaper by the pound, but a dollar's worth of it will do far more sweetening than a dollar's

worth of sugar. As a result, a race of ingenious smugglers has developed along the Belgian and Swiss borders, and in six years nearly five hundred have been arrested and convicted. Austria alone has confiscated twelve tons. It is well known that in Zurich a hundred and thirty people make their living by this traffic, and a night train from Switzerland into Germany was called the "Saccharin Train" for obvious reasons.

In the United States saccharin has been used to sweeten canned corn, glucose candies and the like, but its use in interstate commerce has now been prohibited.

The Relative Power of Illuminants

In the discussion of the relative values and qualities of various sources of illumination the following comparative table is used. It shows the intrinsic brilliancy of each source of light in standard candlepower per square centimeter (about 0.155 square inches):

Ordinary candle	0.66
Gas flame	0.75
Petroleum lamp	0.98
Standard candle	1.00
Incandescent gas burner	5.06
Acetylene flame	6.23
Carbon filament glow lamp	86.50
Metallic filament glow lamp	219.50
Arc lamp (approximate)	3000.00
Sun at zenith (approximate)	90,000.00

Measuring a Frozen Water Supply

In the semi-arid West the amount of water which melting snows will contribute to the mountain streams is a matter of vital interest. Accordingly the United States Weather Bureau has undertaken to forecast, early in March of each year, the probable dry-season flow. To do this it is necessary to make a systematic survey of the extent, depth, density and water equivalent of the snow layer on the headwater slopes of certain irrigation streams. The Bureau is also coöperating with various irrigation and power companies in this work by furnishing them the instrumental equipment and publishing the reports of their surveys.

This snow measurement is no mere estimate based on general appearances, as have been the predictions made by the Old Settler heretofore; it consists of careful soundings of the snow, made with specially constructed apparatus at several thousand places in the watershed, about forty or fifty examinations being made per square mile of snow.

The apparatus is handled by two men traveling on snowshoes, and consists of a snow-density tube two and one-half inches in diameter and 50 inches long, with which the snow samples are taken; and a spring balance scales for weighing the tube and contents, the dial of the scale being gradu-

RECORDING SNOW DEPTH AND DENSITY
The U. S. Weather Bureau Observer is making an observation with a density tube and a scale hung from an alpenstock. Part of the snow core protrudes from the tube.

ated to show the water-equivalent of the contents of the tube.

After the survey has been completed, daily gaugings of the stream flow show the amount of water flowing away, and observations from a precipitation gauge show the amount of water added to the watershed in the form of rain or snow, so that at any date, comparisons may be made with the water prospects at the same dates in any previous years during which measurements of this sort have been made. This is the plan in operation for three seasons on the Maple Creek watershed near Springville, Utah, and excellent results have been obtained so far from the predictions.

J. Cecil Alter
Observer, U. S. Weather Bureau.

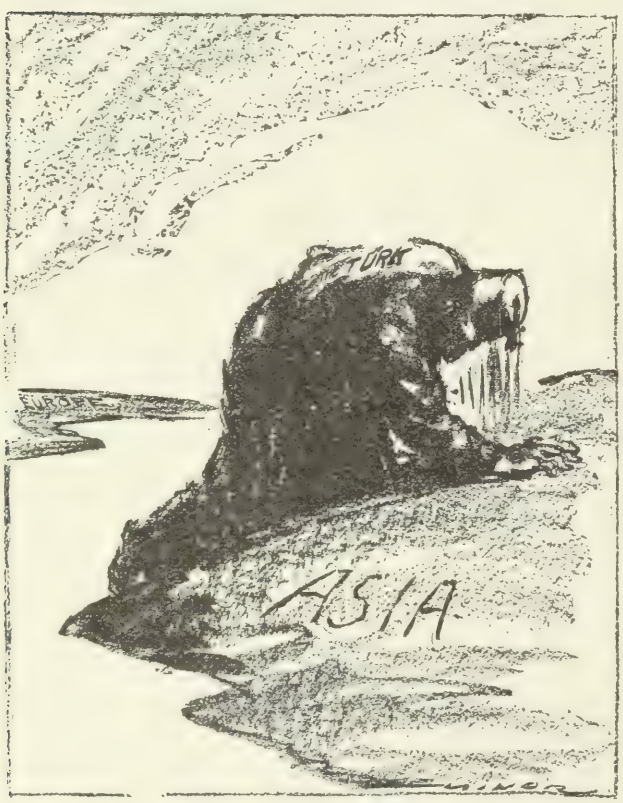
Fifty Years Ago

From **The Independent**, April 16, 1863

PERSONAL

An Incident at Mr. Beecher's Church.—On Sunday evening, at Plymouth Church, Brooklyn, when the pastor announced the results of a collection which had been taken up in the morning for the Children's Aid Society, he read a note left in the plate to the following effect:

"I am an Englishman; the superintendent of an anti-slavery school. I have stood up during the whole service, and no one has been polite enough to offer me a seat. I inclose a half-sovereign."



Without changing a muscle of his face, and with the utmost gravity, Mr. Beecher proceeded to say: "Hereafter I wish my congregation and the ushers to understand, when they see an Englishman standing in the crowd who has been the superintendent of an anti-slavery Sabbath school, and who has a half-sovereign in his pocket, they must give him a seat instantly."

GREECE

The Kingdom of Greece, which, for many months, has been begging for a king, has at last found a gentleman willing to take the crown. Of course he is not a Greek. Greece governed by a Greek would be a propriety which Europe would not tolerate. The official telegram from Athens to London announces the news as follows, dated the 2d:

"The National Assembly of Greece, by a decree agreed upon today, have unanimously proclaimed as the constitutional King of the Greeks, Prince William George, second son of Prince Christian of Denmark, under the title of George I, King of the Greeks. His successors will profess the orthodox religion."

CARTOON OF THE WEEK

BE IT EVER SO HUMBLE
THERE'S NO PLACE LIKE HOME

A cartoon by Minor in the St. Louis *Post-Dispatch*.

Pebbles

"Do you prefer burlesque to drama?"
"Why, of chorus."—*Yale Record.*

Home is a place where you can take off your new shoes and put on your old manners.—*Ye Crabbe.*

"Oh, Clarence," cried the expectant bride, "father has offered to pay all the expenses of our honeymoon trip."

"Good!" exclaimed Clarence. "Then we'll never come back."—*Brooklyn Life.*

Guest (to waiter)—"This soup has a hair in it!"

Waiter—"That's no hair. It's a crack in the plate."

OPERAWOCKY.

'Twas sembrich, and the emmaeames
  Did gluck and gadski in farrar;
All scotti were the tetrazzines,
  And the jadlowkers nordica.

"Beware the schumanheink, my son!
  The weils that catch, the teytes that bite!
Beware the fornia, and shun
  The marygarden night!"

He took his slezak sword in hand:
  Long time the bonci foe he sought.
So rested he by the fremstad tree,
  And stood awhile in thought.

And as in rappold thought he stood,
  The schumanheink with eyes of flame,
Came burrian thru the griswold wood,
  And hinshawed as it came!

One, two! One, two! And thru and thru
  The slezak blade went snicker snack!
He left it dead and with its head
  He segurolaed back.

"And hast thou slain the schumanheink?
  Come to my arms, my destinn boy!
Caruso day! ruffo! calvé!"
  He melbaed in his joy.

'Twas sembrich, and the emmaeames
  Did gluck and gadski in farrar;
All scotti were the tetrazzines,
  And the jadlowkers nordica. —*Life.*

THE WEEK

Opening of the Tariff Session

On the first day of the special session of Congress, the 7th inst., Mr. Clark was again elected Speaker of the House, receiving 271 votes. There were 111 for James R. Mann, the Republican candidate, and 18 for Victor Murdock, whom the Progressives had nominated. The Tariff revision bill was introduced by Mr. Underwood. It covers the entire tariff, and is substantially in accord with last year's Democratic bills in the schedules to which those bills related. Notable exceptions are removal of the duty on raw wool (which in last year's bill was retained at 20 per cent) and a reduction of the duty on sugar by one-quarter, with a provision repealing the entire duty three years hence. The limits of our space will not permit a comprehensive summary of the bill. Among the products or articles put on the free list are meats, flour, shoes, lumber, coal, iron ore, milk, potatoes, cotton bagging, leather, sewing machines, steel rails, nails, fence wire and fish.

It is estimated that the revenue would be reduced by $86,000,000. The present maximum and minimum provisions are repealed, and the President is authorized to negotiate treaties of reciprocity, subject to ratification by a majority vote of Congress. As a rule, ad valorem rates are substituted for the present specific duties. A reduction of 5 per cent is allowed for goods imported in American-built ships, owned wholly by American citizens. The importation of any aigrette or plume or skin or feather of a wild bird, ostriches excepted, is forbidden. Provisions for an income tax are a part of the bill. These impose a tax of 1 per cent upon incomes in excess of $4000 and rising to $20,000, with graduated additions which make the highest rate 4 per cent, for incomes exceeding $100,000.

On the following day, President Wilson went to the capitol and read his message, at a joint session of the Senate and the House. A majority of the Democrats of the Senate Finance Committee desired that sugar and wool should be considered in two separate bills. He preferred one bill for the entire tariff, and on the 9th he again visited the Capitol for a conference with Senators on this subject. It was known that the action of Senators from States producing sugar or wool might prevent the passage of the bill.

Mr. Wilson thought that the caucus of House Democrats should be an open one. He was opposed, however, by a vote of 164 to 84. The caucus has been discussing the bill, schedule by schedule. It has added shoe machinery to the free list and increased the Underwood rates on pottery and glassware. The efforts of a few Democrats to modify the sugar clauses were unsuccessful. Motions to defer the removal of the entire duty for nine years, or for any time longer than three years, were defeated by large majorities. At the end of the week a considerable number of Democrats opposing free wool united in a movement to procure a duty. The fate of the wool and sugar clauses in the Senate could not be foreseen.

Complaints have been made by manufacturers directly interested in the proposed changes. The American Cotton Manufacturers' Association has sent to the Democratic leaders resolutions declaring that the proposed duties on cotton goods would cause "appalling depression" of the industry and a transfer of a large part of it to foreign lands. Flour mill men say that if flour is to be free, there should be no duty on wheat. Manufacturers of woolen goods complain. Hawaii, Porto Rico and the Philippines oppose free sugar because they desire to retain their advantage. Importers in New York severely criticise the changes in the administrative part of the tariff law, asserting that they are in the interest of protected manufacturers.

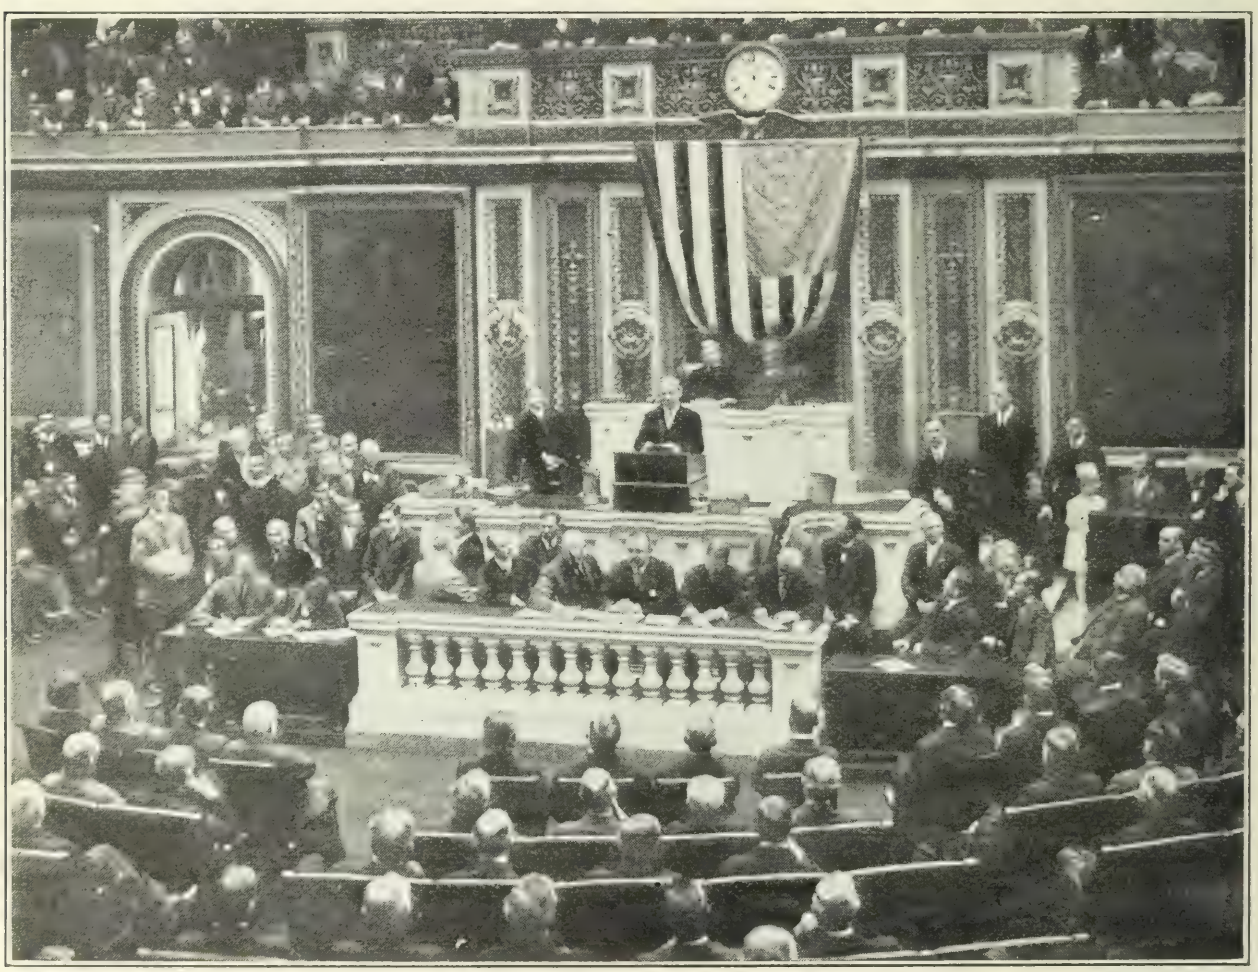
Connecticut was the thirty-sixth State to vote approval of the Constitutional amendment providing for direct popular election of Senators. No more are needed, and Senators hereafter will be chosen by the method thus prescribed.

California and Japan

The Japanese Government, on the 12th, directed its Ambassador at Washington to make formal representations concerning the bill, pending in California's Legislature, relating to the holding of land by aliens. There is much irritation in Japan on account of this bill. A meeting of the leading Chambers of Commerce has been called, to consider the matter. There was talk of boy-

cotting the Panama Exposition at San Francisco, but it is now said that such action will not be taken. The bill has been so amended that it is said to be technically in harmony now with existing treaties.

President Wilson has repeatedly conferred with California Senators and Representatives, and has exprest a hope that the measure will be made unobjectionable. He has said that if its objectionable provisions are enacted, the question must then be taken to the Supreme Court for a final decision. In Japan it is said by the press that passage of the bill would be "a deathblow to the Christian propaganda" in that country. For this reason missionaries are urged to exert their influence against it.



Floods in the South

At the end of last week New Orleans was in danger, owing to the growing flood of the Mississippi. Levees had been strengthened, but it was expected that the water would be higher than ever before. In the course of the week several levees in Arkansas and near Memphis gave way. There is an epidemic of smallpox in the camps of refugees along the lower Ohio. President Wilson has asked the National Drainage Congress, in session at St. Louis, to consider plans for preventing such floods as have recently caused so much loss of life and property. Senator Newlands will press for action upon his bill, which would create a board empowered to regulate rivers and would provide a fund of $50,000,000 a year for ten years.

It is estimated that the loss of property in Ohio amounts to $250,000,000, and that the cost of rebuilding bridges and approaches, with accompanying work, will be from $50,000,000 to $100,000,000. The present governments of several counties and municipalities may be superseded, so far as the work of reconstruction is concerned, by commissions. It is proposed that these shall serve for two years.

The Situation in Mexico

Little progress was made last week either by the rebels or by Huerta's troops. Carranza's men captured two towns in Nuevo

Copyright, Harris & Ewing

PRESIDENT WILSON READING HIS MESSAGE TO CONGRESS

The House and Senate in joint session in the House of Representatives heard the first message delivered personally by a President since John Adams's time, 112 years ago. Speaker Clark and Vice-President Marshall are seated on the rostrum; the President stands at the reading desk just in front. The members of Congress are seated on the benches which have replaced the desks used until this year. It used to be too easy to read and write during the debates.

Leon, where General Aubert has been fighting for the Government. At Naco, on the Arizona border, General Ojeda defended himself, with 300 men, against repeated attacks by a much larger force of rebels. He was aided by fine artillery, handled by an expert English gunner and two negroes who had deserted from the American Ninth Cavalry. One of these negroes was killed by the side of his machine gun. In one of the Naco battles, on the 8th, many bullets crossed the boundary. Five soldiers and a teamster of the Ninth Cavalry were wounded by them. Whereupon both factions were sharply warned by the American commander. In the South, the city of Tenancingo, in the State of Mexico, was captured by the rebel forces of General de la O. At the port of Guaymas, in Sonora, two sailors from the American cruiser "California" were killed by the police in a street fight.

The charges against Ambassador Wilson, sent to Washington by Luis Rojas, an officer of Mexico's Congress and grand master of the Masonic order in Mexico, have been supported by several persons, one of these being the widow of the late President Madero. The Huerta Government has undertaken to prosecute Rojas for treason. Refugees from Mexico tell stories about the killing of Madero and Suarez. Martias Oviedo, formerly Madero's secretary, says they were made unconscious by drugs and were shot while in that condition. Their dead bodies, he continues, were taken from the palace in an automobile. Jose Quevedo, formerly editor of a paper at the Mexican capital, whose publication office was burned by Huerta, says he saw the assassination; that Suarez was shot in the street by a file of soldiers; that the same soldiers refused to kill Madero, and that he was shot by their commander, Major Cardenas, who has since been promoted.

Colonel Rivera, formerly of Madero's army, but now in Mobile, says he saw the murder of Abram Gonzales, Governor of Chihuahua. Gonzales, he asserts, was not shot, but, with hands and feet tightly bound, was thrown under a railway train which mangled and crushed him. The Huerta Government sought to intercept Dr. Francisco Vasquez Gomez as he was leaving the country at Vera Cruz, last week, on a Ward Line boat, but the captain would not give him up, and he went to Cuba.

Huerta's Government greatly desires formal recognition at Washington. It is said that failure to borrow money in New York or Europe has been due to lack of such recognition, and Huerta is sorely in need of money. The railroads are crippled, many of the great smelting plants are closed or are running on half time, and rebels encounter little opposition.

Other Countries South of Us

At the opening of the new session of Cuba's Congress, on the 7th, there were indications that the patronage controversy between the President-elect and Governor Asbert had been settled. The new President will be supported by a majority in both houses. It is feared, however, that the assassination of Ceferino A. Mendez, the recently elected Conservative Mayor of Cienfuegos, will be followed by a bloody feud between Conservatives and Liberals.

There has been some excitement in Havana because of a duel, in which Rudolph Warren, the son of a rich American owner of sugar mills, was killed by Hannibal Mesa. The latter's seconds were ex-Speaker Ferrara and a member of Congress. Seconds on the other side were another member of Congress and an army officer who is the nephew of the Secretary of State. Mesa at once came to New York. Ferrara has been sharply criticised in the Havana press. It is alleged that the terms of the duel were unjust to Warren, who was known to be very near-sighted. Ferrara has sought to defend himself in a published statement. It is expected that several additional duels will be caused by the controversy. The Cuban Government has sent agents to the Isle of Pines to inquire as to the interest of American residents in the movement for annexation to the United States.

Brazil and Peru have recognized the Chinese republic. Brazil's tariff concessions to Americans have been renewed, but only to April 9, and further renewal will depend, it is said, upon the action of our Government in the suit, under the Sherman act, against Brazil's cornered or valorized coffee.

In the House, at Washington, Mr. Simms's bill to repeal the toll exemption clause in the Panama Canal act has been introduced again. It is approved by the chairman of the House Committee, but emphatically opposed by the chairman of the Senate Committee, Mr. O'Gorman. Press dispatches say that the President is not yet convinced that exemption violates the Hay-Pauncefote treaty.

Canada and the Navy Bill

The dogged opposition of the Canadian Liberal party to Mr. Borden's bill providing for a gift of three dreadnoughts to the British Navy at a cost of $35,000,000 seems likely to be the occasion for bringing about drastic changes in procedure in the Dominion Parliament. Since Parliament reassem-

bled after the Easter recess there has been no repetition of the continuous day and night sittings which characterized the weeks from March 3 to 8, and March 10 to 16—each of which weeks officially appears in the Hansards as consisting of one single day. By the courtesy of Sir Wilfrid Laurier the Government was enabled to get thru votes on account—one-sixth of supply—to carry on the Government services. This done, the debate on the navy bill was resumed, and it was quickly made clear that the Liberals were as much determined to obstruct its passage as they had been before Easter.

The rules of the Canadian Parliament permit of practically unlimited debate, and it was thru taking advantage of the opportunity thus given to obstruct Government business that Mr. Borden and the Conservatives forced Sir Wilfrid Laurier to go to the country on the reciprocity question in 1911. The Liberals claim that they have quite as good a right to force the Government to appeal to the people on the navy question, for there was not even a hint of Mr. Borden's policy of a contribution in money to the British navy from the Conservative leaders at the general election.

Seeing that there was no possibility of carrying the Navy bill under the existing rules, Mr. Borden changed his tactics, and introduced an amendment to the rules which would permit the Government to exercise the closure. By a clever parliamentary trick on Wednesday of last week the Government leaders, assisted by the Speaker, deprived Sir Wilfrid Laurier of the opportunity of replying to Mr. Borden when he proposed the new rule—an action which precipitated what was almost a riot in the House of Commons.

This incident has greatly embittered feeling in Canada, and many supporters of the Borden Government have protested against the treatment of the ex-Premier. The English newspapers are beginning to protest against the gift of the three battleships being put thru Parliament by sheer force of a majority which was elected on a totally different issue, and are asking that there may be an expression of the will of the people before the ships are accepted by the British Government. If the closure rules are carried, the Borden Government can, no doubt, force the Navy bill thru the House of Commons; but the Senate is still overwhelmingly Liberal, and this is a case in which it would probably use its power and reject the bill. One thing is assured. Canada will make some contribution to the Imperial navy, but when this contribution will be made, and in what form, it is not possible yet to predict.

Mrs. Pankhurst Is Freed

On the 12th, after serving nine days of a three years' term of imprisonment for inciting persons unknown to commit arson, Emmeline Pankhurst was released on license from Holloway Jail, and removed to a nursing home. Mrs. Pankhurst had refused all nourishment, and forcible feeding had not been attempted, owing, it is said, to a weakness of the heart. She must report at intervals to the police, and if she commits any misdemeanor is liable to rearrest without a warrant, and to imprisonment for the rest of her term.

The militant leader was, of course, not present at the great Albert Hall demonstration of April 10—tho she announced in advance that she would "break the bars" to be there. Suffrage workers deny that they are responsible for the anonymous letter received by Justice Sir Charles Montague Lush, who sentenced Mrs. Pankhurst, threatening him with death. "Human life is sacred to us, as much so now as before Mrs. Pankhurst's sentence," says the secretary of the Women's Social and Political Union.

Haystack burning, the firing of railway cars, the planting of bombs, are all reported from different English towns. The grandstand of the great cricket ground at Tunbridge Wells was fired on the 11th, and a suffraget attack upon the balloon and aeroplane sheds of the Army Flying Corps is reported from Farnsborough. At the Sunday meetings for suffrage in London, the crowds were more hostile than ordinarily, and the police had to exert themselves actively to save the women from rough handling.

Zelie Emerson, an American militant, was released from Holloway on the 8th. Various reports of her serious condition are in circulation. An unsuccessful attempt was made to create an international incident of this case.

A Suffrage Strike in Belgium

A general strike of workingmen, who demand manhood suffrage and the principle, one man one vote (instead of the existing system of plural voting) seems inevitable in Belgium. Action by the young King, who is popular, and is thought to be more liberal than the ministry, can alone prevent it.

From 300,000 to 400,000 workingmen are involved, and in some quarters a revolution, or the secession of the Walloon and Flemish Provinces, is prophesied. The Socialist party is back of the movement, and its leaders are optimistic. They say that contributions are pouring in from many outside sources, some of them from Belgian resi-

dents in the United States, and that a four or six weeks' general strike is feasible, tho they hope to win their victory in three weeks. Order will be kept, it is said. Maurice Maeterlinck, who has been called the Belgian Shakespeare, has exprest his sympathy with the laboring classes "in this great battle against a Ministry which represents all the ugliness, lowness and perfidy of the old Belgian clericalism."

The railways claim to have enough coal on hand to last six weeks. The printers, it is reported, will contribute generously, but will not leave their work. Many employers are subscribing to the strike-fund, making the outlay as a kind of insurance. In Liège, employers offer half pay to their workers who strike for the suffrage for three days, if they will only return to work on the fourth. The "Christian unions," associations of Catholic workingmen, said to have a membership of 85,000, have decided against the strike. On Sunday, there were several Socialist parades, the biggest of them at Mons, where between 20,000 and 30,000 men were in line.

The seriousness of a prolonged strike of the miners in the region of Borinage is very great. These wet mines would be practically ruined by a week's idleness.

When France was threatened by a general strike, during the first Briand ministry, the Government interfered by calling men to the colors, and then assigning all railway workers to the railways. No such device could be effectively operated in Belgium, where the war footing is only 180,000 men in a population of 8,000,000. Fifty thousand soldiers are under arms, but most of these troops are "citizen soldiers," strongly sympathetic with their Socialist brethren in cases where they are not Socialists themselves.

The Belgian suffrage is limited to men over twenty-five years of age. Those with property valued at $400 or deriving $20 annually from national bonds vote twice. Graduates of the higher secondary schools, office holders and professional men vote three times.

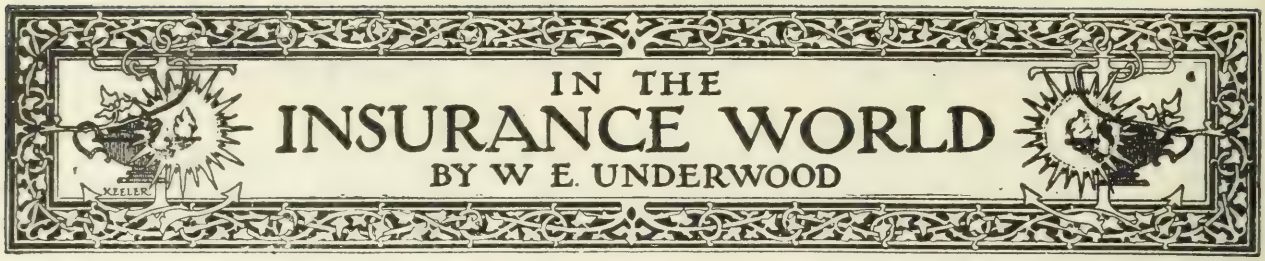
Alfonso Again Escapes Assassination

On Sunday, the 13th, the King of Spain, returning to his palace from a review of conscripts, narrowly missed assassination. Three shots were fired at him by a Catalonian aged twenty-five years, named Rafael Sancho Alegret. The young King saved his life by dismounting when he heard the first shot, and standing behind his horse, which was wounded in the chest. The assailant describes himself as a carpenter, but has not the appearance of a manual laborer. He is variously reported to have made the attempt "on a sudden impulse" and to avenge the execution of the anarchist Ferrer.

Alfonso XIII came to the throne at sixteen years of age, in 1902. Tho personally popular, attempts to assassinate him have been made on seven earlier occasions. On June 1, 1906, his wedding day, a bomb was thrown into the carriage in which the royal couple was returning from the Cathedral. Just a year earlier, in Paris, a bomb was thrown at the King, who was seated in an open carriage with the President of France, Emile Loubet. Alfonso has shown notable courage in danger. Thus on the latest of these occasions he turned the assault into a personal triumph and received an ovation from his subjects.

Jose Canalejas, Spain's Liberal Prime Minister, was assassinated only last November.

Franco-German Trade



The *Lokal Anzeiger* states that France would have more to lose than Germany in the event of a commercial boycott between the two Powers; since "the sale of French products in Germany is very sensibly greater than that of German products in France."

The Paris *Temps* corrects this statement thus: From 1908 to 1911 the French importations into Germany have risen from 420,000,000 marks in value to only 524,000,000, while the German products admitted thru French custom houses are now worth about 600,000,000, instead of the 438,000,000 of five years ago.

Montenegro and the Balkans

The siege of Scutari is likely to be raised by the Montenegrins and Servians. Montenegro will, it is said, receive monetary and territorial concessions. There has been no important news from Scutari since the bloody capture of the Tarakesch Fortress near that city, early in the month. Rumors of the capture of Scutari itself were false. When the powers undertook to coerce Montenegro and, at Austria's special instance, to withhold territorial aggrandizement, King Nicholas planned to abdicate with a view to the union of his country with Servia. Prince William of Sweden, second son of King Gustavus, is said to be a leading candidate for the throne of the made-to-order kingdom of Albania.

Bulgaria is said to have laid formal claim to Salonika, now occupied by the Greeks. The Powers have made further concessions to Bulgaria, since making their last formal announcement of a basis for peace-terms.

Life Insurance and the Income Tax

Life insurance interests are troubled over the possible unfavorable effects of the income tax provisions of the new tariff bill now before the extraordinary session of Congress. While it is difficult to believe that it is the intention of the national legislature to lay an impost on the benefits accruing thru death to widows and orphans, the language of the bill seems sufficiently clear in that direction to cause apprehension. Section II, subdivision B, reads as under:

"That, subject only to such exemptions and deductions as are hereinafter allowed, the net income of a taxable person shall include gains, profits and income derived from salaries, wages or compensation for personal service of whatever kind and in whatever form paid, or from professions, vocations, businesses, trade, commerce, or sales or dealings in property, whether real or personal, growing out of the ownership or use of or interest in real or personal property, also from interest, rent, dividends, securities, or the transaction of any lawful business carried on for gain or profit, or gains or profits and income derived from any source whatever, including the income from but not the value of property acquired by bequest, devise, or descent, and also the proceeds of life insurance policies paid upon the death of the person insured."

This section is evidently intended as a definition of the word income as used in the bill. Incomes are the thing to be taxed according to the general understanding. A person owning $100,000 worth of property —real estate, mortgages, stocks, bonds, etc. —the earnings on which aggregate $5000 a year, is to pay a tax on $1000, the proposed law exempting all incomes of $4000 and less. Now, the question arises: Under the language of the bill are the proceeds of a life insurance death claim to be regarded as capital or income? We will bring the first and last portions of the bill into close relation in order to simplify the matter for readier comprehension: "the net income of a taxable person shall include gains, profits and income derived from salaries, wages or compensation for personal service, etc. . . . and also the proceeds of life insurance policies paid upon the death of the person insured." Compressing closer we fairly have the following: "the net income of a taxable person shall include . . . the proceeds of life insurance policies paid upon the death of the person insured." If that is what is meant, then all death benefits in excess of $4000 are taxable.

The author of the income provisions of the bill, Representative Hull, of Tennessee, is reported as disavowing any intention of bringing the principal sum payable as a death claim by a life insurance company within the taxing powers of the law, wherefore we may conclude that the purpose is to make the income derivable from the proceeds of a policy taxable. But it must be admitted that the actual language used is susceptible of a different construction.

It is not reasonable to believe that beneficences of this character will ever become the object of taxation in this country, and it is therefore the duty of policyholders and the managements of life insurance companies to see that the law on this point is clear of all possibility of confusion and doubt. Last week a special meeting of the executive committee of the Association of Life Insurance Presidents was held in New York City and Robert Lynn Cox, chairman and general counsel, was instructed to communicate by wire with every life insurance company in the United States, calling their attention to the situation and advising action in simplifying it.

If, as seems to be the case, only incomes derived from the proceeds of death benefits are to be taxed, no harm would ensue, for an amount of principal closely approximating $100,000 is required to get the annual income above the exemption, $4000; and persons receiving so large a sum could pay the tax without inconvenience. On the other hand, the amount of revenue secured by the Government would be small because the number of persons carrying life insurance aggregating $100,000 and over is comparatively small. As a matter of fact, all the argument is against including any mention of life insurance in the bill, except to exempt it specifically from taxation as, in subdivision G, all labor, horticultural, fraternal and beneficiary societies, orders and associations are exempted.

Missouri Anti-Trust Law

A year or more ago the Legislature of the State of Missouri, emulating the examples set by Texas and Louisiana, enacted what is called a fire insurance rating law. That is to say, it deprived the companies, individually and collectively, of the right to calculate rates on insurable property in that State, and vested all authority in that particular in a bureau under governmental direction, with the requirement that all schedules of rates should be filed with and receive the approval of the Commissioner of Insurance before becoming effective. There were a number of other provisions, but the principal object was to remove the rate-making power from the companies and lodge it with the State.

As a matter of course, the companies objected to this innovation and have properly regarded all such movements as an invasion of their trading prerogatives; but, with their characteristic timidity, they submitted there just as they had done elsewhere. Fire insurance managements are extremely conservative and are inclined to put up with a great measure of imposition rather than imperil the plants they have built up in any given field. That they and their policyholders are the unnecessary victims of unwise laws of one kind or another in the greater number of the States, particularly in the West and South, is a fact well known to every careful student of the subject. We say unnecessary victims deliberately, because some of the laws referred to are not only of no benefit whatever, but are productive of injurious results and as a consequence increase the cost of the service.

The companies bowed submissively to the Missouri rating law and sought to make the best of a poor situation. After great trouble and expense—several hundred thousand dollars as to the latter, all of which came out of the companies' treasuries—the entire State was rerated; and it was discovered that the premium tax would be just a little higher than it had been before. Official theories seem to have failed when put to actual test. A new Legislature comes in and repeals the rating law, putting in its place a drastic anti-trust law, so general in its terms and so severe as to procedure and penalties as to render operation under it extremely dangerous to managements. This law becomes effective on June 1.

In a statement made by Judge Thomas Bates, of Chicago, general counsel of the associated companies, a distinguished expert in fire insurance law, he says:

"The recent measure passed and signed by Governor Major is by far the most drastic of any regulatory law ever attempted by any State in this country. It is absolutely impossible for the fire insurance companies to do business within the requirements of the law. Any company attempting to do so subjects itself to the possibilities of forfeiting its property in that State and lays its manager and officers outside of the State open to arrest and imprisonment for the act of any of its hundreds of agents. The new law makes it a felony for any person connected with an insurance company to violate the Sherman anti-trust law. Before, the offense was a misdemeanor. The measure also declares that a president, director and officer can be extradited from any State in this country to Missouri to be tried, and also holds them directly responsible for the acts of any of its agents and managers."

Since the passage of the latest law—there will be another in due course—the Attorney-General of Missouri has announced that he will prosecute with vigor every infraction of it, stating at the same time that all he wants is the "restoration of competition." It must be understood that the rating law, the one just repealed, prohibited competition, all companies under it being compelled to use the approved official rates. On that point it is quite plain that the legislators of Missouri don't know what they want.

The seriousness of the situation is reflected in the action taken at a meeting of company executives in Philadelphia, Wednesday night a week ago. A special report of the matter informs us that the meeting was attended by the representatives of the leading fire insurance companies of the United States and Europe, and while the number participating is not disclosed, it is reasonable to assume that all the active companies will support the conclusions reached. At that meeting it was voted unanimously to cease business in the State of Missouri after April 30. The resolution adopted states that the managers have taken the advice of counsel and that while they keenly desire to continue in business in the State they are compelled to conclude that they cannot do it under the harsh and unusual provisions of a law which puts them in jeopardy of prosecution and conviction, however conscientiously they might endeavor to obey it.

The Travelers' Insurance Company has insured its own employees under its group plan. The day after the insurances became effective, J. O. Chapman, payroll auditor at Chicago, died suddenly. His beneficiary will receive $1000.

FINANCE & TRADE

The First Crop Report

This season's first crop report, issued last week, is a very favorable one. It relates to winter-sown wheat and rye. Last year, owing to the winter-killing of several million acres, the crop of winter wheat was only 399,716,000 bushels. At harvest time there were only 26,571,000 acres. This year the area of the winter wheat fields is 32,387,000 acres, and the condition of the growing plants on April 1 was 91.6 per cent, against 80.6 one year ago, and a ten years' average of 86.3. According to New York authorities this indicates a crop of 537,600,000 bushels. In Chicago they say 563,000,000. Allowance is still to be made, however, for the abandonment of winter-killed acres, the number of which will be reported in May. The record crop of winter wheat has been the 492,000,000 bushels of 1906.

Harvest acreage has not suffered much reduction this year on account of severe weather, and it is reasonable to expect, at present, a crop ranging between 500,000,000 and 525,000,000 bushels. The condition of the growing rye is 89.3 per cent. As the area is 2,448,000 acres, against last year's 2,117,000, a crop of 38,355,000 bushels is indicated. Last year's was 35,664,000.

In the Securities Market

The stock market declined last week, owing to announcement of the issue of new securities by prominent railroad companies. It had not been perceptibly affected by the floods, the death of Mr. Morgan, or the new tariff bill, but prices yielded a little, beginning on Wednesday, when it became known that the Pennsylvania was to offer $45,000,000 of new stock to its shareholders at par, that the St. Paul had sold $30,000,000 of 4½ per cent bonds, and that the New York Central had placed $10,000,000 of one-year notes. Here was $85,000,000 in one day, and the general comment was that the companies had made unexpected concessions in the terms. Some concession appears to have been required by the condition of money markets here and abroad. Net losses of the three stocks for the week were as follows: Pennsylvania, 4½; New York Central, 4; St. Paul, 2.

At the same time, the Government's rejection of the latest plan for separating the Union Pacific and the Southern Pacific exerted a depressing influence. Reports concerning trade thruout the country were not unfavorable, on the whole, altho reference was made to some hesitation, due to pending tariff propositions.

Cost of Living

The British Board of Trade recently published tables relating to the prices of the food of working-class families in London, and showing that in buying this food a sovereign (20 shillings) in 1912 went only as far as 16 shillings and 3 pence in 1895. Commenting upon this, an Australian paper directs attention to a report of the Commonwealth statistician, Mr. Knibbs, on the cost of living in Australia.

His tables show index numbers for food and house rent in the several Australian capital cities during a series of years. The number relating to Sydney, for example, has risen from 846, in 1904, to 1099 in 1912. Other cities show similar advances, and the average for all is increased in the eight years from 858 to 1091.

Financial Notes

During the thirteen years that have passed since the Pennsylvania Railroad Company's pension system was established, payments amounting to $8,368,786 have been made to 7152 pensioners, 3817 of whom are still living. Nearly 300 of these are more than eighty years old.

Our exports to Latin-America in the current fiscal year will be about $1,000,000 for every business day, or $325,000,000, against only $115,000,000 ten years ago. In the last ten years our imports from the same countries have doubled, rising from $226,000,000 in 1903 to $460,000,000 (estimated) in 1913.

In a recent address before the Chamber of Commerce of Syracuse, James G. Cannon, president of the Fourth National Bank, of this city, said that after a careful study of the situation he had felt for a long time that clearing house associations should be incorporated. He was confident that sooner or later they would be compelled to submit to incorporation.

Our Nerveless Better Element

The term has been abused. It is often used offensively, but it stands for a reality. There is "a better element." Men and women with fine, healthy bodies are so far better than their unfortunate brothers and sisters whose tenements of clay are disintegrating under the wages of sin. Men and women with good brains, well stocked with knowledge, are so far better than dunces and drivelers. Men and women of courage, self-control, generous natures and helpful impulses are so far better than cowards, poltroons, stingy souls and weaklings.

As thinking, behaving organisms, men and women are not born free and equal; they never were; they never will be. Neither are all men and women born totally depraved. Some are physically and mentally well born, and fortunate they are. Others, and unhappily they are more numerous, are conceived in iniquity and born in sin.

The better element ought to rule. It ought to create and govern the state. It ought to control and manage industry. It ought to dictate and administer education. With the firm hand of a wise and benevolent despot it should conserve and develop civilization.

There is a fool kind of a democrat, a sissy sort of humanitarian, to whom these sentiments are shocking. We delight in shocking him. We expect to shock him on all proper occasions. There is democracy and democracy. The democracy that glories in ignorance and dirt, which insists that some foul-mouthed son of "the people" whose political education has been conducted in corner saloons would make as good a President of the United States as George Washington did, is one kind. The democracy that would destroy privilege and would equalize opportunity in order that natural ability and force of character might have a free field in which to assert themselves is another kind. That the same word should be used, as it is, as a name for two such totally different things, is unfortunate. We have no use for the first kind of democracy. We are deeply concerned for the triumphant establishment of the second kind thruout the world.

But it seems to be no part of the program of "manifest destiny" that the rule of the mentally and morally fit in a democracy of opportunity should be established without setback and discouragement. The course of wisdom is not more addicted to running smoothly than the course of true love is, and the worst discouragements, unhappily, are attributable to a certain paradoxical inadequacy of the better element.

The true better element is always tender-hearted and liberal-minded. It detests cruelty and tyranny. It loves to enlighten and to lead, but it shrinks from commanding, dictating, ordering. Still more does it shrink from whipping, imprisoning, killing. By instinct, habit and reflection adjusted to a world of reason, kindliness and good sense, it finds itself charged with responsibility for the preservation of civilization in a world of ignorance, superstition, graft, dirt, indecency and savage cruelty; a world in which the firm hand is still necessary, in which the enemies of soci-

ety must be represt, sometimes crushed, and not infrequently killed.

And so it happens that every now and then we see things going to the bad, because all the better element has lost its nerve. It shrinks from the plain duty of performing its own inalienable task.

England and America are suffering wofully from this cause at the present hour. The Asquith Government is nerveless in its dealing with lawlessness. American state, county and city governments have pretty nearly given up the job of suppressing serious crime, especially homicide. The better element is whimpering over the unfortunate criminal who has "never had a chance to be a decent man."

For the better element thus to give way to weakness is the crime of crimes and sin of sins. Nothing can excuse or palliate it. It is a crime and a sin of which really great men are never guilty. No men ever lived who more utterly hated killing than Robert E. Lee and Ulysses S. Grant, but the names of these two men will be held in everlasting honor because, while they differed as to whose cause was right and whose was wrong, it could be said of each that when he saw what seemed to him to be his duty, he "went for it thar and then."

The Duty on Sugar

It is provided in the pending tariff bill that the duty on sugar shall be reduced at once by one-quarter, and that the remaining three-quarters shall be taken off three years hence.

The duty on sugar now yields an annual revenue of about $52,000,000. It also sustains the cane sugar industry in the South and has built up the beet sugar industry in the West, which in fourteen years has grown in output from 32,000 to 600,000 tons. In Hawaii and Porto Rico, from which sugar comes into the States free of duty, the product has risen to 800,000 tons. Sugar from the Philippines is free, up to 300,000 tons a year. By treaty there is also a discrimination of 20 per cent in favor of Cuba.

In a bill passed last year by the House it was provided that the entire duty should be at once removed. A delay of three years for the greater part of the duty is now proposed, but the effect of such legislation, in its bearing upon the industries now benefited by the present law, would not differ greatly from the effect of sweeping repeal. That the cane sugar industry of Louisiana would be blotted out appears to have been admitted by Mr. Underwood in the House Democratic caucus, on the 12th, when he said:

> We are willing to concede that immediate free sugar would put the producer to grave disadvantage. It would drive him out of business without giving him opportunity for the substitution of other products. But free sugar in three years will give the sugar producer a chance to pay his bills while he is changing his function from that of a sugar planter to that of a producer of the various diversified crops suitable to be grown in what are now sugar-producing regions.

He had in mind also, of course, the growers of sugar beets.

The argument in support of the removal of the duty rests upon the assertion that the change would greatly serve consumers by reducing the cost of living. In opposition it is said that the duty, widely diffused in consumption and by no means burdensome, yields a large amount ($52,000,000) of revenue; that it sustains one industry and has created and built up another; that indirectly it has favored and fostered the sugar industry of Hawaii, which supplies nine-tenths of the islands' exports, and that its influence has been exerted in the same way upon the industry in Porto Rico and the Philippines. The preferential concession of 20 per cent to Cuba has been the warrant for preferential concessions granted by Cuba, and these have increased our exports to the island. If the duty should be removed, our treaty of reciprocity with Cuba would die, and Cuba's tariff concessions would probably die with it.

It is asserted by persons interested in or familiar with the sugar industry of Hawaii that removal of the duty would ruin it and thus greatly depress the islands. This is by far their greatest industry. There is no available substitute for it. Local capital owns and controls it, and there are more than 10,000 stockholders. Owing to the higher cost of

labor on the islands, they could not compete with Java if there were no tariff discrimination. The ruin of their sugar industry would decrease the purchasing power of the islanders and very perceptibly reduce exports to them from the States.

What would our consumers gain by removal of the duty? The per capita consumption here is about 80 pounds a year, but this includes the sugar used in confectionery, condensed milk and other kinds of food the retail price of which would not be affected. Probably it is fair to say the average directly concerned is 60 pounds. The average duty is a little less than 1½ cents a pound. If the consumer's gain should be equal to the duty —and it might not be—it would amount to 90 cents a year. By the reduction of one-quarter he would profit to the extent of 22½ cents.

But it is by no means clear that reduction or removal would be the measure of his gain. There are wholesale merchants who predict that he would gain nothing, altho $52,000,000 of revenue would be lost. If the domestic cane and beet sugar industries should be greatly deprest, or blotted out, the world's output would be reduced and prices would be affected by the old law of supply and demand. Ruin of Hawaii's industry would also reduce output. Supply would be controlled exclusively by foreign producers, and by the confederated refiners here, whose interests would be served by free sugar and by depression or destruction of the domestic cane and beet industries.

In our opinion the arguments against removal of the duty on sugar far outweigh those in favor of it, and we think that those parts of the tariff bill which relate to sugar should not be enacted.

Mr. Morgan's Will

Mr. J. Pierpont Morgan's will, as printed in full, is a remarkable human document. It expresses Mr. Morgan's character. It is very long; it is very full and precise; it makes many appropriate personal bequests; it is very thoughtful for all who have served him; it makes three outright charitable bequests amounting to $700,000 and it provides for annuities on charities which, if capitalized, would probably make several million more, and all the rest goes to his son as residuary legatee. That is, perhaps twenty or twenty-five million dollars is allotted to specific bequests or to trusts or to the continuation of annual gifts, such as the $100,000 a year to the Maternity Hospital, and all the rest goes absolutely to J. Pierpont Morgan, Jr.

The world's curiosity asks first what is to become of the princely collections of art which he had made; they go with the residuary estate to his son. No one knows their value, but it is immense. Nor do we yet know the total amount of his estate, which has been supposed to be from $75,000,000 to $100,000,000. That he had other plans in mind by which to benefit the public by his collections he makes known in his will; but he says that time has not been allowed him to make such disposition of them as he wished, and he leaves to his son the expression of his pious desire that the son will be able to carry out what he had planned to do. We may be sure, then, that the collections will not be scattered, but that they will ultimately go where they will most be a blessing to the people. There are museums and libraries which will no doubt finally receive them.

The great human interest in the will is the beautiful expression of absolute confidence in the integrity of those with whom he was connected. He has such confidence in his son, in his partners, in his executors. He ties up nobody. He trusts their character. This appears especially in his direction to his executors as to property standing in his name personally, which he may have held in the interest of one of the great firms he was connected with. He directs that if his surviving partners shall agree that any such property properly belongs to the firm rather than to him they shall deliver it over without question or legal quibble. Equally he requires that any promise, written or verbal, which he has made of any gift shall be fulfilled. He is very careful to repeat that any expression of desire or hope which in this will he may have made to any beneficiary shall not be legally or morally binding. It is merely the expression of his wish, but full liberty is left to the legatee to do what he thinks wise. The whole spirit

of the will, in its confidence in proved character, is in peculiar harmony with his remarkable testimony before the Pujo committee, which will be long remembered, that character is the one chief basis of credit.

Some will notice that the $700,000 given outright for benevolent objects, mostly for the Episcopal Church, with annuity designations, is considerably less than the amount given in Mr. Kennedy's remarkable will. In explanation it may be said that the world happens to know of some eight millions given by Mr. Morgan during his lifetime, not including art objects given to the Metropolitan and other museums, and not including certainly many other gifts which he was careful not to make public. He liked to give quietly in his lifetime, and he did not doubt that his son was in the fullest accord with him and that there would be no break in the manner of bestowing such benefactions. The younger Morgan, now head of the family and of the business, is, we believe, in complete sympathy with his father's grand purposes, and the public will not suffer thereby.

The will presents to us a remarkable man, as his life had done; a man of genius and a man of the highest business capacity and of fine ideals. Men who were suspicious of wealth had a respect for J. Pierpont Morgan. That confidence and respect will descend to his son.

Thomas Nelson Page's Protest

The war against the proposed change of the name of the Protestant Episcopal Church goes merrily on, as our readers have already seen. And it was time that the opponents should wake up to the danger that it might succeed. The effort is not now, as it was three years ago at the General Convention, to drop the word *Protestant* from the title, and call it the American Episcopal Church, but, waxing bolder, to substitute *Catholic* for *Protestant,* making it the "American Catholic Church."

The leading Episcopal weekly in this country is *The Churchman,* and since the change in its ownership and editorship it has seemed sympathetic with the proposed change. But now, as representing the laymen, Mr. Thomas Nelson Page is allowed in it an article covering nine columns, in which he stands stoutly for *Protestant* as the name of his Church, and for Protestantism as the movement which saved our country from Spanish control and has given us liberty of thought. "The United States was made by Protestantism. Had it not been for the Protestantism of the English Church this nation would have been flying the Spanish flag today." He does not mince his words, but denounces the tyranny over thought which, he tells us, has silenced the free tongue of a famous American Archbishop and which reversed the attitude of the Catholic University at Washington. Hear him:

> There can be no unity with Rome without complete and utter submission to her. The whole history of her past establishes the fact, and no part more absolutely than her recent past. Twenty years ago men began to talk of the liberty of the Catholic Church in America. It appeared as if it were destined to make a great name. Great ecclesiastics, honored of all men, like Archbishop Ireland and Archbishop Keane, stepped forward and took the lead with tongue and pen. Cardinal Gibbons appeared acquiescent; the great educational institution at the gates of the Capital fell into the movement. What happened? Rome said "No." The movement stopped as tho petrified to stone. The leaders were disciplined. Ireland found himself compelled to recant and lost his Cardinal's hat. Keane was called abroad and made Archbishop of Damascus, where no active Christian Church had been for a thousand years. The University lost its "distinguished head" and became quiescent if not reactionary. And the power of Rome was never more signally asserted than in this control of a progressive movement which was led by these honored prelates and had the good will of nearly all American Protestants as well as Roman Catholics.

It will be remembered that it was by the margin of a single vote that three years ago the effort to drop the name *Protestant* failed, the vote being by dioceses. Now the reason for the bolder effort is what it was then—to draw the Church nearer to the Roman Catholic Church, and to separate it definitely from the "dissenting" Protestant "sects." The proposition has raised so great a storm that we do not believe it can succeed, but the possibility of it ought to teach the adherents of that Church that a first tactical policy should be to give a popular constitution to the General Convention.

The Concert of the Powers

We have heard much of late of European pressure first upon Turkey, and later on the Balkan allies, and now put severely on Montenegro. It is told, and Servia is told, that Scutari must not be taken, that Albania shall not be consolidated with her two neighbors, but must be made independent, with a king to be selected by the Powers. Turkey in her dire distress was glad to yield to the will of the six Powers, but the allied nations would resist if they could, but they must submit. They can fight Turkey, but they cannot fight all Europe.

Now this is not the first case of the sort. The present status of the Balkan nations was not of their fixing, but was fixt by a conference of European nations. What they did then did not please Bulgaria and Servia, nor did it please Turkey, but they were unable to resist. The major power was too much for them.

Yet Turkey is an independent nation. So are Bulgaria and Servia and Montenegro and Greece—and yet the nations of Europe in their combined force claim and exercise the right to impose their will on these five nations. They declare that the war must end, and they arrogate to themselves the right to say under what conditions it shall end, and how the conquered territory shall be distributed.

By what right do they do this? Simply by the major right of the power to enforce their will. They meet together thru their chancelleries and consider what is best for the common advantages of the European nations as a whole, and particularly of the nations at war. The result is in part altruistic and in part selfish, as in the case of all decisions of persons appointed to impose legislation on a people. Our Congressmen and Senators have the common good at heart; they have also at heart the wishes of the individual localities they represent. Just so the nations of Europe act and legislate in the present crisis.

This means that we already have in existence, but acting only sporadically, called into existence on occasion, the congress of the nations, and the common executive of the nations. In the court of The Hague we have the regularly organized judiciary, ready to hear and decide cases; and in the conferences of The Hague we have in embryo, acting in an advisory referendum way, the beginning of the legislative function; while we have scarce the germ of an executive department. But the present conference of Powers on the Balkan matter is confessedly both legislative and executive. It lays down a law as to the conditions of peace, and then it is ready to enforce it with soldiers and ships. That is exactly what it did in the case of Crete. It provided a government for Crete, and then sent a combined military and naval force to compel its acceptance. When Crete wished to be allowed independence enough to annex itself to Greece the conference of the Powers refused to allow it, just as now they will allow it.

We have hoped and urged that The Hague conferences and courts should be only the beginning of the federation of the nations of the world. We now see that the nations are already exercising both of these powers as occasions arise. The way is clear for the step, that of enlarging the partial federation of The Hague, and adding to its present judicial and legislative functions, the executive. Then we shall have the organization of The Hague complete.

International Christianity

The blustering, irritant mischief-makers of the California Legislature are matched by the Japanese howling hotheads who do not know what they want when they want war. But there are also, in Japan and the United States alike, sober men in high positions who keep their heads and know that we must have and shall have peace. There is no more likelihood of war with Japan, for all the mutual insults, than there is of war with Great Britain.

Does not President Wilson desire the most cordial relations with our neighbor across the Pacific? Will not Secretary Bryan do all he can to keep the peace? Will not our Administration seek in all legitimate ways to minimize the mischief of Sacramento, and will not Premier Katsura do as much with his mobs at Tokio? There is no question of it.

In Japan occasion is taken of this flurry for a dinner given by Count

Okuma and attended by leading Japanese statesmen and American visitors, at which John R. Mott, Hamilton W. Mabie and Dr. Peabody represented the desire of the American people for peace, while Count Okuma, formerly Premier, recognized the provocations and the hostile sentiment, and said, as reported, that the dependence in the end must be, not on diplomacy or courts or commerce, but on the control of the Christian spirit. That is a remarkable statement as coming from a country which is Buddhist and not Christian. But it is an appeal to the United States and to California to be Christian in the treatment of other nations. The California bill to forbid Mongolians to buy or rent land is not Christian; it is no less than heathenish. In the person of Count Okuma Japan rests her case on the appeal to the Christianity which we profess.

And American Christianity and humanity will respond, even as the three Americans at Count Okuma's dinner responded. But already the American missionaries in Japan had made their appeal by cable to the California Legislature. The Legislature, we trust, will listen. To be sure, one member offered a resolution to refuse to receive the message, and to bid the petitioners to mind their own business, but he could find no support and he withdrew his motion.

Even more impressive than the appeal from Japan is the recognition of Christianity made by Yuan Shih-kai, the President of the Chinese Republic. In a formal proclamation which sounds like the proclamation for a thanksgiving or fast day by President Lincoln, he calls on all the Christians in China to meet on Monday, April 27, in their houses of worship, to beseech God to bless the Legislative Assembly now meeting, and to guide it aright in the preparation of a permanent constitution, in the election of a President and other officials, for the peaceful inauguration of a permanent republican government, and for the recognition of the republic by foreign nations. This act, coming from a non-Christian nation, is unparalleled in the history of the world. It shows a deep and genuine religious spirit. It shows how the labors of Christian workers in China have imprest men in the highest rank. It further indicates how immense has been the influence of Christian teaching in the creation of the republic. That influence is not to be counted by numbers.

The numbers are not large; only 324,890 Protestant communicants reported, and 1,363,697 Catholic baptized converts, with but 548 native pastors and 701 native priests; and what are these among the four hundred millions of China? Much, very much, for they represent all which the West has to teach the East, whether in the arts and sciences, in self-government and liberty, in morals and religion.

May the time come—perhaps it is already coming—when the Christian impulse shall interchange influence both westward and eastward, and the white and yellow races shall stir up each others' pure minds in the incitement and emulation of peace and good works.

For the Business of Farming

It is not wholly out of the love of agriculture that such presidents of railroads as J. J. Hill of the Northern Pacific Railroad, President Yoakum of the 'Frisco lines, and President Brown of the New York Central, have spoken and planned for larger and better farming. The more wheat and corn, the more freight for the railroads. But when young Vincent Astor, with his inherited millions, plans to give his time and labor and money to the task of developing and teaching the best methods of scientific farming, or when President Vail, of the Western Union Telegraph Company, establishes a fully equipt agricultural institute for the State of Vermont and New England as well, we may believe that the success of our agricultural colleges has wakened wealth out of its sleep, and we may hope that by practical demonstration, and by the coördinating of the experiments of the various agricultural colleges some such advantage may be made here by private enterprise as has ben gained in England by the investigations and experiments of many years at Rothamsted.

President Vail's institute will be at his home town of Lyndon, Vt., and will teach boys and girls the mysteries and pleasures of farming, and to it will be

given his 5000 acre farm. President Brown has an immense farm in Iowa, which he makes very profitable, and it is his present aim to improve the business in New York. President Yoakum's farms are in Texas and Long Island and are scientifically and profitably developed. Mr. Astor has inherited a fine farm on the Hudson River of 6000 acres, to which his father paid little attention, and the young man's ambition is to make it a model and an instruction for the State. There ought to be no such thing as worn-out land. The oldest lands in Denmark or Germany are the most productive, having gained fertility every year, and that is the problem for our own country. Such young men and old men as these mentioned have vision.

The Circus

"Hasn't the circus gone out of fashion?" said an intellectual friend of ours the other day. We confessed our ignorance that it had. Even as we discussed the question, we felt for our tickets in an inside pocket. It would not do to let the friend know they were there; he is too intellectual to sympathize with such frivolities. But at heart we are not ashamed of our fondness for circuses. There is always some one younger than we to treat as an excuse for going ourselves. And when we go, there are always hundreds and thousands present with no better excuses.

Part of one's pleasure in going to the circus is retrospective, no doubt. We like to repeat actions that gave us pleasure in youth; we have not altogether put away childish things. But there are certain sides of the tented show that do properly appeal to all ages. Is there any term set to the enjoyment of physical perfection? The calliope is noisy and the pageant tawdry, it may be; but the horses are more beautiful and more numerous than ever, the riding as daring. The clowns may not be as humorous as once—certainly they do not seem so irresistible, and every year they grow more explosive; but the strong men are as strong as of old. Also one finds newer forms of entertainment; Japanese wrestlers struggle ponderously and jiu-jitsu is dexterously done. The circus is as instructive in some ways as the geography we used to study with wonderful diligence. And there is the same master of ceremonies in the same lustrous top hat, declaiming with the same resonant confidence that each act is the best ever. Hush! He is offering twenty-five dollars to any one who can ride the circus mule.

The circus is one of the essentially harmless entertainments that is not traditional alone, but national. It is an interest common to East and West, to North and South, to town and country. When it visits Four Corners the tent is crowded, and when it comes to New York the Madison Square Garden is filled to the roof. All parts of the land, all sections of the population, all ages of the race; they are all at the circus tonight.

The freaks alone we deplore—the freaks and the calliope. In so far as the circus sets before its public an entertainment of physical force and skill, of animal intelligence and beauty, its offering is not harmless alone, but beneficial. The men and women of the circus are clear-headed, firm-bodied folk, rough on some sides, perhaps, like their circus humor, but necessarily sober living and sane. Would that we might say as much for ourselves and all our friends! It does no harm to indulge in circus-going. Our intellectual friend does not enjoy the performance; he would prefer to see a Brieux tract presented as a drama, or to read a novel by Arnold Bennett, or to attend a meeting of one of his learned societies. We do not quarel with him; but once a year we go to see the elephants.

Protecting the Capitol

We are likely to differ as to the cleanliness of the tobacco habit, and otherwise as to its value from an ethical point of view; but that smoking has an economic bearing we are compelled to learn from recent illustrations. In the Capitol at Albany there has recently been hung up a notice, "No smoking in the Capitol." Our lawmakers presumed it to be an April Fool, but found that literally the Trustees of Public Buildings had issued the order, and that it was going to be enforced. A fire had been discovered under the eastern approach of the Capitol; and John Bowe, Superintendent

of Buildings, reported to Governor Sulzer that cigarets and accompanying matches, in his judgment, should be prohibited. The Governor agreed with him, and hereafter smoking will be excluded from at least one State House.

Fires caused by careless smokers, that is, by the habits of habitual smokers, amount annually to one of the largest divisions of fire loss in the United States. Any one who travels thru the South will find the most rigid rules governing the landing places of the steamers and the railroad freight-houses. Wherever cotton bales are exposed the pipe and cigar are banned. This is largely true also where the Southern pine is the dominating timber, sifting its dry needles to carpet the roofs and the yards. This places a degree of restriction on the use of tobacco that is wholesome and just. Reconsidered civilization demands a larger degree of social privileges, but less individual freedom.

Municipal Universities

We have State universities, and we are beginning to have city universities. Among our cities which have successfully conducted such universities or colleges are New York and Cincinnati. As stated lately by Dr. Claxton, Commissioner of Education, of the students in the Cincinnati College of Liberal Arts, 79 per cent are from the city; 22 per cent have no father living, and of the living fathers over three-fourths are non-professional, commercial or mechanics. Most of the students, too, support themselves wholly or in good part, and it would be impossible for many of them to go elsewhere for an education. For such the privilege given by the city is priceless.

The city university is a new institution abroad as well as in this country. In England, such are the universities of London, Birmingham, Liverpool, Manchester, Leeds and five others, and such are the new German universities at Hamburg and Frankfort. The University of Leipzig is municipal and old. Our larger cities have universities already established by private benefaction within their own limits or close at hand, so that all that is needed to make them municipal is for the city to make an annual grant to the amount for the tuition of students living within their limits. Why should not Boston or New Haven or Chicago or Philadelphia pay the tuition of students at universities near at hand?

Census Changes

We regret that the President makes the position of the Director of the Census a political appointment. He has removed Mr. E. D. Durand, who was selected for his special training and experience, and who has made good, and has put in his place William J. Harris, a business man of Atlanta, whose claim is that he was chairman of the State Democratic Committee of Georgia.

If the new director should be able to carry out Mr. Durand's proposition to take the next census thru the mail carriers, he would place himself in the category of a public benefactor. The last census cost the United States over $14,000,000, while Germany did all of her counting, and it was pretty thoro work, for less than $1,000,000.

Much of the work required of our census takers comes very near being nonsensical as well as valueless. It is utterly impossible to report to these inquirers the acreage of many crops, and the value of many crops, but whether it is worth our while to pay a large sum for asking all the foreigners in this country how long they have been here, is to be considered. At any rate the mail carriers have gone thru a training that will enable them to get at the people far more intelligently, and get at the required data far more accurately than a lot of raw hands, picked up for fifteen days.

The Condemnation of Socialism

There is a monthly published in Washington called the *Protestant Magazine*, devoted to warfare against the Catholic Church. We are pleased to see that it owns that the oaths lately attributed to the Knights of Columbus, etc., are forgeries. But it condemns a genuine letter from the Papal Delegate at Washington, Mgr. Bonzano, which it prints in photo-

graphic reproduction. It was in answer to a man, who asked whether as a Catholic he had the right to vote for the Democratic, Socialist, or Republican ticket as he pleased. The Archbishop Delegate says:

You must remember that if the Catholic Church condemns doctrines which are pernicious to the good of the faithful, she does it only to defend and protect the religion of her children. Therefore you should submit to the decisions of the Church even at the cost of sacrificing your political principles. For your guidance I may mention to you the fact that Socialism besides being a political party is also an anti-religious sect. In order to convince yourself of this you have only to read what Socialism teaches regarding religion.

This is not very awful. Any Protestant minister would be at liberty with great positiveness, to urge his hearers to do what he believes is right in religion, whether a matter of politics or not; and many have thus advocated the "higher law." As a member of the Catholic Church one submits to its authority as wiser than his own. That is the chief difference between a Catholic and a Protestant. What the Church decides and requires is thereby proved right and a duty; and Mgr. Bonzano gave, under the principles of his Church, correct advice to his enquirer. The man's only escape, if he does not like it, is to leave the Church, and the Church will help him out. The Church has condemned Socialism as irreligious, and that ends the matter.

In Brief

The German Socialists have done one good thing in exposing the deep-laid plot of the manufacturers of war material and of the Army and Navy leagues to frighten the German people into making extravagant preparations for war. They got up fictitious scares, got provocative reports printed in French papers and generally duped the public by such forgeries. They are now exposed, and it will be long before Germans put faith again in such alarms. We hope this will kill the frightfully expensive bill for enlargement of the army.

A Catholic journal praises the liberality of Protestants in Prince Edward Island who gave, one $5000, another $6000 and another $10,000 to rebuild a Cathedral which had been destroyed. Help of that sort is sometimes reciprocated. Some time ago a Canadian priest who had received many subscriptions from the "separated brethren" for building his church, was asked to make a subscription for a new Presbyterian Church. He replied that the rules of his Church would not allow him to help build a Protestant Church, but that he would give $10 to tear down the old church.

We do not recall that any of our American Archbishops has published his approval of woman suffrage, but the London *Tablet* has a letter from Archbishop Delany, of New Zealand, who assures English Catholics that it is not a bit terrible, that there have been no evil results, that no candidate could purchase the women's votes for the drink shop, or could get their support if he flaunted a disregard for the principles of Christianity. The *Ave Maria* quotes him at length and tells its readers that suffrage for women is an open question with Catholics.

The Southern States have been more progressive than the Northern States in the suppression of the liquor traffic, almost certainly for the reason that they are more agricultural and have fewer cities. Colonel Watterson is credited with a different reason, and is quoted as saying: "The pretense is temperance. . . . The real underlying compelling cause is the negro." A very careful doctor's dissertation by Leonard S. Blakey proves that this is not the case, and that where there are most negroes the white people have not insisted on prohibition.

A bill before the United States Senate would provide, if it became law, that no business engaged in interstate traffic shall employ any girl under fifteen years of age, or pay any girl or woman less than a minimum wage of $9 for a week's work, which must not be over six days of eight hours each. True it is, the states should enact suitable minimum wage laws for women, but such a law as this would be a stretch of that clause of the Constitution which gives Congress power "to regulate commerce . . . among the several states." Can wages be carried in interstate traffic like goods?

President Wilson has found himself obliged to do what President Roosevelt did, appeal to the Governor of California not to provoke Japan to anger. If California must make a law to forbid aliens to own land, let it be made general and not in terms apply to Japan only. Even so it would be directed against Japan alone and would be so administered. All this trouble is made by the labor unions which want no competition.

This is the way that grace is said in the theological school of a certain Protestant Church we know of in this country. The stu-

dents cross themselves at meals, and the grace is repeated in Latin. It is said to be very impressive. Another way is one we know of in a Southern family of many children. The parents were detained at a certain meal and the children could not begin to eat until grace was said. At last hunger drove them to tell the old colored mammy to say grace, which she did in these words: "Lord, bless dese yer honeys, and make what dey eats agree wid 'em. Amen."

According to a Census bulletin just issued there were found in the State of New York 1,840,960 married men, and 145,844 who had been widowed, a total of 1,986,804; and of married women 1,793,558, with 373,190 widows, a total of 2,166,748. There were 7,436 divorced men, and 10,227 divorced women, a total of 17,663. The proportion of the divorced of the two sexes to the total married, 4,153,552, is 1 to 235. In the previous Census of 1900 the proportion of divorced to married was 1 to 301. These are serious figures.

We take this from the London *Spectator* on American lynching: "There is absolutely no excuse for lynching. A man of high political courage in the Chief Magistracy could stop it. We have no doubt of that whatever. And why should not Dr. Wilson be that man? Has he not the refinement, the sensibility, and the vision which would inspire his action?" That is as silly a comment as could be made. He could no more stop it than he can stop a tornado that turns up where not expected.

This is the way they do it in Germany. The chief manufacturers of velvet have joined in a combine, or trust, and they promise not to raise prices, and will allow customers to deal with the same firms as of old; but customers will be required to have all their work done by members of the syndicate, and those refusing to do so will be charged 25 per cent above regular list prices. In this country we would call it restraint of trade and send men to prison for it.

We commend to the lover of correct, but not too correct, speech this from Professor Gildersleeve in the last number of the *American Journal of Philology*. He is speaking of that "phonetic syzygy" by which in pronunciation we run together closely connected words, and he says: "By a certain class of people this phonetic syzygy is avoided in the interest of clear enunciation; but to a cultivated ear nothing can be more offensive than the pronunciation of 'at all' in two distinct syllables."

This is Dr. Osler's advice to the Yale students, first don't worry about yesterday or tomorrow. We think we have read that somewhere in the Gospel. Next: "The first two hours of a day determine the day. If you have been romping with the younger aphrodite the night before you will be as bleary-eyed as a fish when you get up, and the day will be lost. Quit tobacco and liquor. Bright eyes are the thing, and bright eyes never came from the free indulgence of wine, women and song."

The first negro in the South to lose his job is "Bob" Smalls, Collector for twenty years at Beaufort, S. C. In the Civil War he was pilot of the Confederate steamer "Planter," and while the officers were asleep one night in town he and nine other negroes of the crew ran away with her and gave her up to the Union forces. He was a member of Congress for twelve years and of the constitutional convention of 1895.

Maclear says, in his *Introduction to the Creed*, of the word *Catholic*, "As used by the earliest Christian writers it denotes the general or universal Church in opposition to a particular body of Christians." That is, it would not, in its earliest use, be properly applied to a denomination, such as the Baptist, Methodist, Episcopal or Presbyterian denomination, each of which is "a particular body of Christians."

Nearly 40 per cent of the territory of the United States is now covered by the maps issued by the Geological Survey at Washington. They are ridiculously cheap, we believe 5 cents apiece, and include every highway and by-way, every pond, hill, brook and farm-house. They are just the thing for motorists or vacation travelers who enjoy exploring their own country.

Dr. Manning, rector of Trinity Church, in this city, asks, "Who would think today of calling himself a 'Protestant Episcopalian'?" Nobody, scarcely, just as nobody thinks of calling himself a "Roman Catholic." A single word is enough, "I am an Episcopalian," "I am a Catholic."

It is almost a miracle that the Pope seems to be recovering after being so near death; and a miracle it will come to be told as the story is repeated of the dream, or vision, he had when his lately deceased sister appeared to him that he had yet much work to do and would recover.

Governor Blease, of South Carolina, keeps his idio-sin-crazy before the public. His last was vetoing a compulsory school-attendance bill.

What Is the Peace Movement?

By Edwin D. Mead

[Mr. Mead is the managing director of the World Peace Foundation, founded with $1,000,000 by Edwin Ginn, the Boston publisher and philanthropist. No American, indeed no man, in this generation has stood more consistently and persistently for the principles of international justice, and no one can speak with greater authority on the Peace Movement than Mr. Mead.—EDITOR.]

The movement for international justice and the better organization of the family of nations, the peace movement, is the most commanding cause of our time, as the anti-slavery movement was in the United States the most commanding cause of the period preceding our own. The peace movement is at this time describing much the same course as that of the anti-slavery movement in the decade before 1860. That movement had been for half a century a great moral crusade, with the most heroic men and women of America working in its behalf thru the press, the pulpit, the platform, poetry, story and song; but because the evil which it confronted was so great and so menacing to the life of the country, it was inevitable that the struggle should pass into politics, and the Republican party came into existence to cope with it, with the result which is a matter of history. The peace movement, which has for a century been a great moral crusade, is similarly passing now into world politics; and the sure result must be the supplanting of the system of war by the system of law and the transformation of the mass of rival and conflicting nations into an orderly and coöperative family or federation. The movement commands universal attention, and this attention must steadily increase until the effort commands universal endorsement and success. People are asking as never before, many people who have little time for big books, what the peace cause means and what are the antecedents and cardinal features of its present period; and it is to answer very briefly this common inquiry and to note the influential agencies of the movement, especially among ourselves, that the present article is written.*

The organized peace movement may be said to have begun with the organization of the New York Peace Society, by David Low Dodge, in August, 1815. This was the first peace society ever formed in America or in the world. In Christmas week of the same year the Massachusetts Peace Society was organized in Boston under the leadership of Noah Worcester and William Ellery Channing. The English Peace Society, the first in Europe, was founded in London, June 14, 1816; from these American and English centers the movement has spread around the world, commanding ever wider attention and coöperation until at last we see its culmination in the effort, thru the Hague Conferences and other agencies, to organize the family of nations as here in the United States our family of states is organized. The peace movement is simply the growth of law, the extension of the principles of political order and organization to the widest circle. The nation is the largest unit that is yet organized; the peace movement is the effort to organize the world.

Altho as a formal movement it began only a century ago, the prophecies and demands for international order and fraternity had been multiplying during the preceding half dozen centuries, as indeed they had been the burden of the Jewish prophets and the primitive Christian religion; and the heroic service of George Fox and the Quakers in modern times should not be forgotten. Dante's *De Monarchia* was a great and impassioned plea for a united world under the form of a revived and idealized Roman Empire. Erasmus wrote powerfully against the folly and wickedness of war and in behalf of the organized peace of Europe. The *Great Design* of Henry the Fourth of France, which was brought to the knowledge of the world in the posthumous memoirs of Henry's famous minister, the Duke of Sully, was a remarkable plan for such an organization, but its aim was largely the subor-

*Readers are referred to the author's pamphlet upon *The Literature of the Peace Movement*, and to the chapter upon "The Latest Literature of the Peace Movement" in Prof. William I. Hull's new volume upon *The New Peace Movement*.

dination of the House of Austria. The first detailed plan for the federation of Europe which was at once comprehensive and disinterested was that of William Penn, published in 1693, thirty-one years after the publication of the *Great Design,* in which Penn appeals for reinforcement of his plan. Kant's famous tractate on *Eternal Peace* appeared in 1795, almost exactly a century after the publication of Penn's *Plan for the Permanent Peace of Europe;* and already, in 1784, Kant had published his less well known but in many ways more impressive essay on *The Natural Principle of Political Order, Considered in Connection with the Idea of a Universal Cosmopolitical History*—these two great essays of Kant's forming together almost a complete philosophy of the peace movement as promoted by its leaders today.

Kant identifies the cause of the world's peace and order with the cause of self-government; and if his philosophy is sound, it was logical and natural that the founders of the American republic, whose brave and broad experiment—in which Kant himself was so profoundly interested—marked an era in the development of self-government, should have been inspired by high international sentiment. Washington, Jefferson and Franklin formed the most illustrious group of practical statesmen in their time who stood pronouncedly in favor of the supplanting of the war system of nations by the system of law. Their arguments anticipate in marked measure many of the chief arguments of the peace workers of the present time; Dodge's pamphlet, *War Inconsistent with the Religion of Jesus Christ,* and Worcester's *Solemn Review of the Custom of War,* the historic statements by founders of the New York and Massachusetts Peace Societies, likewise contain much that is as valid now as when first written. The first formal political demand for the incorporation of an arbitration clause in commercial treaties between nations was framed by Samuel Adams, "the father of the American Revolution," in a memorial to Congress prepared by him for the Massachusetts Legislature during the period between the close of the Revolution and the adoption of the Constitution; the first important treaty embodying an arbitration clause was Jay's treaty with Great Britain in 1795 during Washington's administration. In his speech in the Great Church at Delft, July 4, 1899, when, in the presence of the whole body of delegates at the first Hague Conference and a great assembly of other officials, Andrew D. White, the head of the American delegation, laid a silver wreath upon the tomb of Hugo Grotius, in behalf of the Government and people of the United States, he emphasized American sympathy with Grotius's cardinal principles and the similarity of the political philosophy of the founders of our republic to that which informed Grotius's great work upon *The Rights of War and Peace.*

It was this great work of Grotius, published in 1625, which laid firmly the foundations of international law. "Of all works not claiming divine inspiration," said Dr. White in his address at Delft, "that book, by a man proscribed and hated both for his politics and his religion, has proved the greatest blessing to humanity. More than any other it has prevented unmerited suffering, misery and sorrow. More than any other it has promoted the blessings of peace and diminished the horrors of war." The name of Grotius is the greatest name in the whole history of the peace movement. It was while he was an exile in France that Grotius prepared his *Rights of War and Peace;* and it is a noteworthy coincidence that it was in 1623, at almost precisely the time of its publication, that Emeric Crucé published in Paris his little book entitled *Le Nouveau Cynée,* which contained the first detailed proposal for substituting international arbitration for war, precisely in the spirit of Grotius's great work, and along lines not unlike those suggested three centuries before by another French scholar, Pierre du Bois, whose life covered almost exactly the same period as the life of Dante (1265-1321), and whose principal treatise was written half a dozen years before Dante's *De Monarchia.*

The development of international law from the time of Grotius to our own time, the growing observance of its principles by the nations, the recent

rapid spread of its teaching in the world's higher institutions of learning, the multiplication of societies devoted to its interests and the remarkable enrichment of its literature have largely revolutionized the legal and political sentiment and practice of the world. The study of this development is an integral part of the study of the general development of the peace and arbitration movement.

International arbitration, from the time of Jay's treaty to the present, has advanced with rapid strides. According to the list published by Dr. W. Evans Darby in his *Modern Pacific Settlements,* there were six arbitrations in the eighteenth century, 471 in the nineteenth, and sixty-three from 1900 to 1903. Since 1900 there have been about 150. These hundreds of arbitrations have dealt with cases of almost every character; the point of chief significance is that the results, with one or two insignificant exceptions, have been faithfully accepted. In some cases there have been disaffection and sharp criticism on the part of one nation or the other; but the history of arbitration shows conclusively that when nations have become civilized enough to refer their differences to judicial or arbitral settlement they have become civilized enough to respect faithfully the decision of their judges. Senator Root is entirely right in his judgment, exprest in one of his presidential addresses before our American Society of International Law, that international law and the judgments of international courts are never likely to require any other sanction or enforcement than the enlightened international sentiment of the modern world. Some of our own arbitrations with other nations, like the famous arbitration of the Alabama claims at Geneva, have involved almost every possible point of "national honor" and vital interest, demonstrating that there is no question so grave that it cannot be settled better by arbitration than by war. Gladstone well said in Parliament after the Geneva arbitration that altho he felt that the assessment upon England had been high it was but as dust in the balance compared with the possibility of war between the two great English-speaking nations.

Since the first Hague Conference in 1899, there has been a rapid multiplication of arbitration treaties between different pairs of nations. In the single year 1909 no less than 32 such treaties were concluded, and the total number now concluded exceeds 150. Many of these treaties except from arbitration questions of "vital interest, independence and national honor"; but some of them make no exception whatever; the noteworthy treaties negotiated by President Taft with Great Britain and France in 1911, but amended by the Senate in its action upon them in 1912, were practically treaties without reserve, such as treaties generally will doubtless become at an early date. Denmark's treaties with the Netherlands and Italy, in which the contracting parties engage to "submit to the Permanent Court of Arbitration established at The Hague by the convention of July 29, 1899, all differences of whatever character which may arise between them which they have not been able to solve by diplomatic methods," furnish a model for the arbitration treaties which the leaders of the peace cause desire to see concluded between all nations, making the arbitration of all differences not settled by diplomacy absolutely universal. When this condition is achieved and the confidence of the peoples in the justice and efficiency of their international courts and in the general machinery for the settlement of their differences by legal procedure has been established thru repeated and regular experience, then will the menacing and monstrous machinery for the settlement of disputes by force gradually decline and disappear.

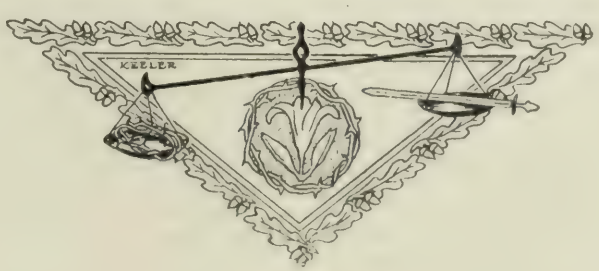
It was a quarter of a century after the organization of the first peace societies that international peace congresses were organized. The first international peace congress was held in London in 1843, owing its inspiration to the English philanthropist, Joseph Sturge, in a conference with members of the American Peace Society in Boston two years before. In 1848-1851 more important congresses were held in Brussels, Paris, Frankfort and London; the prime inspirer of these congresses being Elihu Burritt, who repeatedly urged united endeavor to secure an official congress of

nations, which should develop and codify international law and create an international court for its administration. This program, essentially the program of the Hague Peace Conferences half a century later, had for many years been urged by William Ladd, the organizer and leading spirit of the American Peace Society, created thru the consolidation of the various American local societies in 1828.

Following the London Congress of 1851, there was a long interregnum, occasioned by the succession of great wars in the middle of the century; and it was not until 1889 that the first of the present series of international peace congresses was held in Paris, under the presidency of Frederick Passy, who cooperated with William Randal Cremer in the founding at Paris the same year of the Interparliamentary Union, of which M. Passy was also the first president. The international peace congresses have continued irregularly from that time to the present, two of them (at Chicago in 1893 and at Boston in 1904) having been held in the United States. At the third congress, which met at Rome in 1891, a central International Peace Bureau was organized to arrange for the congresses and give effect to their conclusions and generally to establish headquarters for the peace movement. The plan was suggested by Frederic Bajer, of Denmark. Elie Ducommun, of Switzerland, who presently became the secretary of the bureau for a period of many years, was commissioned to perfect the work of organization, the location having been fixt at Berne. The Berne bureau now has members from all the leading nations which are active in the peace cause, and its work is of great and growing importance, supported by a yearly appropriation of $24,000 from the Carnegie Endowment and by contributions from many sources, including grants from some governments.

National peace congresses were of later establishment than the international congresses. France was the first to act in this field, the first French national peace congress having been held at Toulouse in 1902. England followed two years later, the United States in 1907, and then Germany. The first American national peace congress, which was held in New York in April, 1907, under the presidency of Andrew Carnegie, was the largest peace congress ever assembled, the subsequent congresses having been at Chicago in 1909 and Baltimore in 1911. It should be said, however, that the Mohonk Conferences on International Arbitration, which have been held annually for eighteen years, beginning with 1895, have in great measure performed the function of national congresses for the United States, and their influence for the whole peace and arbitration cause has been incalculable.

The Interparliamentary Union, founded as stated in 1889, has now become a cardinal factor in the movement for the peace and organization of the world, as influential as the whole group of the world's peace societies. It is composed of those statesmen in the various parliaments of the world who are devoted to the peace and arbitration cause, with a total membership today of over 3600. This great body constantly devotes itself, in the national legislatures of its various groups and thru its international conferences, to all those measures which tend to supplant the system of war by the system of law. In our American Congress there are 272 members, in the British Parliament 228, in the French Assembly 516, in Germany 157, in Japan 379, etc. The central bureau of the Interparliamentary Union is at Brussels. The impulse to both of the Hague Peace Conferences was given by the Interparliamentary Union, at its conferences at Budapest in 1896 and St. Louis in 1904.



With the Hague Conferences there began a distinctly new era in the movement for the organization and peace of the world. The movement has now become official and political. At the first Hague Conference, initiated by the Czar of Russia, twenty-six governments were represented. At the second Conference, initiated by the President of the United States, forty-four governments were represented, and the Conference was a veritable Parliament of Man. It provided in its final act for a meeting of a third Conference at an interval following the second Conference essentially the same as the interval between the first and second; this means that the confer-

ences will be regular. This international parliament, for such it is in germ, made up of the official representatives of all nations to confer upon their mutual needs, will, in the lifetime of men now upon the stage, undoubtedly meet as regularly as the Congress of the United States meets to confer upon the mutual interests of the states of the Union.

The work of the Hague Conferences is matter of well-known history and need not here be detailed. Its restriction of the atrocities of war has been noteworthy; but its constructive services, in the creation of the Permanent Court of Arbitration, the International Prize Court, the Court of Arbitral Justice, International Commissions of Inquiry, etc., have been preeminent. We thus have at The Hague an international judiciary and the germs of an international legislature; the germs of an international executive are supplied by the various bureaus, like that of the Universal Postal Union, which are largely located at Berne. It should not be forgotten that the numerous and multiplying unofficial international unions, dealing with all classes of the world's scientific, industrial and commercial interests, are doing almost as much to weave the web of international friendship and coöperation as those agencies which are official and political. The leaders of the commercial world especially are realizing that the system of war and monstrous armaments is an anachronism and does not fit the modern world; where investments are more and more international, and it becomes clear that even the victorious nation in a great commercial war must now lose more than it can gain.

The work for the education of the people and the creation of a strong public opinion in the interest of peace was never so active among us as today. The American Peace Society, with its headquarters at Washington, is establishing branches in every state in the Union. The American Peace League, the Intercollegiate Peace Association and the Association of Cosmopolitan Clubs are powerful new agencies for reaching the student world. The American Society of International Law, the Society for the Judicial Settlement of International Disputes and the Association for International Conciliation are doing most efficient work in their respective fields; and within the last two years we have seen established in the United States the two most generously endowed foundations for the promotion of the peace cause ever yet known in the history of the movement. In July, 1910, the World Peace Foundation, after several years' activity under the name of the International School of Peace, was permanently organized, with provision by Edwin Ginn, its founder, for a perpetual annual income of $50,000; in December of the same year the Carnegie Endowment for International Peace was established by Andrew Carnegie, with an endowment of $10,000,000. This is to mention only American agencies. The provision of Alfred Nobel of Sweden for annual prizes of about $40,000 to eminent peace workers, beginning with 1901, is one of the notable acts in Europe, where in every country the peace organizations are becoming ever stronger; while noteworthy movements in China and Japan are bringing the East and West into closer coöperation, and the Pan-American Union and other agencies are uniting North and South America in relations of good understanding and good will.

Boston, Mass.

Protestant Episcopal or Holy Catholic?

By Benjamin W. Bacon, D.D., LL.D.

[Professor Bacon holds the chair of New Testament Exegesis and Criticism in Yale University, and is the author of many works in elucidation of the Bible. He belongs to the famous family of the name, his grandfather being the distinguished theologian, Dr. Leonard Bacon. His accurate scholarship, the breadth of his learning and the frankness with which he discusses current religious questions give credit and value to whatever he may write. The unity in liberty of the Church would especially appeal to him.—EDITOR.]

An article in THE INDEPENDENT of April 10, entitled "Repudiation of a Church Name," by Rev. G. Monroe Royce, of New Windsor-on-Hudson, N. Y., justly protests against the agitation of a certain element in the Protestant Episcopal Church to change its name to the Holy Catholic Church of America. Mr. Royce is frank and plain-spoken in his objection to what he considers the "snobbishness" of the undertaking, whose supporters in his judgment constitute but a small minority of Episcopalians, themselves one of the smaller denominations of Protestant Christians in the United States. The agitators may nevertheless succeed in their attempt because of the extreme disparity in representation of various dioceses in the General Convention. Having pointed out that the most conspicuous leaders in the movement have been "alien clerics," without appreciation for the historic name endeared to American Episcopalians by generations of high-minded endeavor, and without sympathy for American ideals, he begs them, in the name of both righteousness and peace, to "cease making themselves a nuisance and the Episcopal Church ridiculous."

It is probably true that the American public will view with some derision this change of name if carried out. People who adopt high-sounding titles that do not belong to them "are laughed at, for they not only expose their want of humor, but they betray a vein of innate snobbishness." Unfortunately, American democracy and the vaunted American sense of humor have not availed to protect us against a great deal of this in the social world. In fact, both have been notoriously conspicuous by their absence. It remains to be seen whether they will suffice to protect the large majority of self-respecting American Episcopalians from a humiliation which Phillips Brooks was wont to declare would compel him to renounce his connection with that body.

It is but natural that clergymen such as Mr. Royce should feel keenly this threatened humiliation, and should rebel at the unjust representation in the General Convention which makes it possible. We do not think it strange that he should emphasize the needless affront to self-respecting American churchmen, and the injury to the Episcopal Church, and should touch very lightly, if at all, upon the affront to much more numerous bodies of American Christians. If any reference is made to this more serious aspect of the matter (as we view it), we discover it only in the declaration that the attempt to use the designation *Catholic* in a different sense from that given it by "ninety-nine out of every hundred Americans," viz., as equivalent to *Roman* Catholic, "is to cause confusion, create irritation, and hinder the good feeling which has heretofore existed as regards these matters."

The change, if made, will unquestionably "create irritation and hinder the good feeling which has heretofore existed" among American Christians. But the feeling to which Mr. Royce seems to refer will be negligible, however widespread, as compared with that having far deeper ground with a smaller, tho more thoughtful, element of the American public. Adherents of the Church of Rome will doubtless feel it an affront that what to them is the merest sect of a sect should attempt to arrogate to itself in an exclusive sense a title which they cannot but regard as belonging properly and exclusively to the oldest and mightiest ecclesiastical organization in Christendom. The affront to our brethren of the Roman communion, however, has probably been long foreseen and discounted. It does not add much to the de-

terrent effect of the argument to say that the great mass of the thoughtless, illiterate and irreligious understand the word *Catholic* in the same sectarian sense, and that they will be irritated or amused, according as they look upon ecclesiastical arrogance and self-importance as vexatious or ridiculous.

The really serious affront will be to that very large body of Christians in America to whom more than to any others are due its free institutions and its "catholic" Christian character, the churches which have at least an equal right with any to call themselves the historic churches of Christ in America, and which also number among their members most of the great names of its history, as well as the leading Christian minds of the present day. To at least ninety-nine out of a hundred Protestant Christians of the more thoughtful and earnest type, in this and in every other country of the world, "The Holy Catholic Church" is a title sacred to a far larger and grander body than the Church of Rome, a body whose founder is no other than our Lord himself, and whose destiny reaches forward to that millennial day when all shall be one in Him. It cannot be monopolized by any one body of Christians without very grave and very just affront. Multitudes of evangelical Christians, from Sunday to Sunday, make it part of their worship to repeat the ancient creed, older than any of our miserable divisions, whose confession is: "I believe in the Holy Catholic Church, *the communion of saints.*" All of them hope and pray for the day when this ideal will be a reality. Catholicity at the cost of freedom their fathers felt to be bought at too dear a price; but the progressive Protestantism of today, especially democratic American Protestantism, looks forward to the time when we shall have catholicity *with* freedom, an organization of "the body of Christ" not copied after the despotism of imperial Rome, but rather after the diversity in unity of our own great republic. It hopes and prays for, it heartily believes in and is consecrated to a "Holy Catholic Church of America"; and its faith is the substance of the thing hoped for, the proof of its reality, tho not yet seen. These members of the "Church invisible" are the living American churchmen of today, they who cherish both the continuity and the catholicity of the Christian commonwealth. They believe in and look forward to a "Holy Catholic Church in America" that shall exemplify the democracy of Him who said: "It shall not be among you as among the Gentiles; for their great ones lord it over them. But he that is greatest among you shall be the servant of all."

The time is not far distant when the faith and loyalty and devotion fixt upon this commonwealth of Christ that is to be shall find organic expression. Those who serve and love and hold to this Holy Catholic Church, the communion of all true saints, will find a way to combine freedom and catholicity, leaving the dead past of the Old World and its ecclesiastical quarrels to bury its own dead, and organizing the Church of Christ in America, free and catholic, a Church "having many members but one body." The promise of it is seen even now in the many combinations for Christian service, the multiplying federations of churches, the leagues and unions for coöperation.

The affront we deprecate is to these churchmen of America who, longing for the bond of peace, believing in the coming union and fellowship of saints, had already begun to lift up their heads because their redemption was drawing nigh—it is these who will be shamed and grieved if a renewal of the sectarian spirit of the past shall again put off the day by debasing one of the holiest of terms to a divisive and ignoble use.

As members of the Holy Catholic Church we pray it may be spared this open shame. Hitherto no Protestant body has ever sought to arrogate to itself alone, in an exclusive sense, the title which is our common heritage from the common Lord. Let not the example be pleaded of high-minded men who in protest against all forms of schism refuse any denomination save that of "Christian." This is not exclusive. The title is not monopolized. All whom Christ calls his own are meant to be included under it. The present recrudescence of sectarian zeal covets for itself the title *Catholic* (!) not in the interest of "catho-

licity," but that it may shut all others out and then be paid zealous court to by them. It seeks to monopolize the common heritage to its own narrowly exclusive use, and in designating itself "The Holy Catholic Church" would implicitly and explicitly deny the sacred name to that "mystical body" of Christ, "which is the blessed company of *all* faithful people."

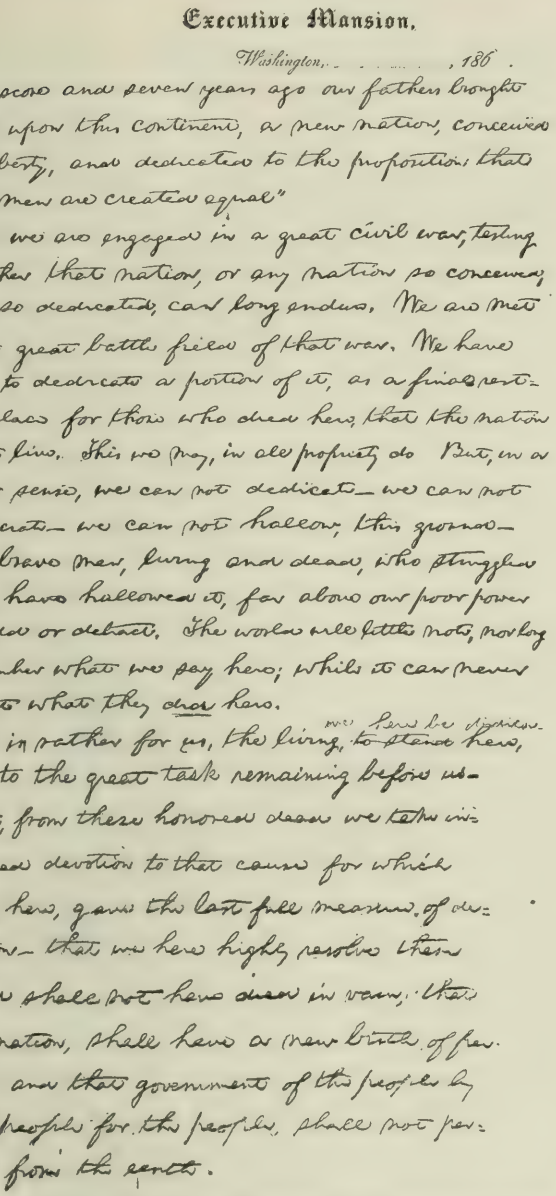
Lincoln's Gettysburg Address

By General James Grant Wilson

[The "Reminiscences of Abraham Lincoln" by General Wilson in our issue of February 20, 1913, has brought us several letters of commendation, among them a request that the author deliver the Gettysburg address into a phonograph in imitation of Lincoln's voice in order that future generations may get some knowledge, tho at second hand, of Lincoln's manner of speaking. This General Wilson does not consider himself competent to do, but he has provided us with facsimiles of two versions of the Gettysburg address in Lincoln's hand. There are said to be a hundred versions of this address in circulation and the last Congress past a resolution calling upon the librarian of the Congressional Library to decide upon the correct text to be engraved upon the walls of the Lincoln memorial to be erected at Washington.—EDITOR.]

It was the writer's happy privilege to hear several of the most famous speeches delivered before and during the Civil War by the great American of whom Lowell said:



Here was a type of the true elder race,
And one of Plutarch's men talked with us face to face,

Lincoln was not only one of the wisest of men, but the English-speaking world is now aware that he was among its greatest orators. This fact was not fully appreciated during his life. The flowers of rhetoric are conspicuous by their absence from his speeches, but it may be doubted if Webster or Burke, Bright or Gladstone, could have found equally beautiful and pure language to express the broad philosophy and the exquisite pathos of the Gettysburg address of half a century ago.

The high tide of the Rebellion broke on the rocky hights and hills of Gettysburg and Vicksburg in the first week of July, 1863. Since that time Grant and Thomas, Sherman and Sheridan, Meade and Hancock, with more than three-quarters of the mighty opposing hosts that met on those hard fought and decisive fields, have crossed the silent river and joined the vast and peaceful bivouac of the dead. Four months later followed the solemn ceremonial of dedicating the Pennsylvania battle ground, destined in the coming centuries to be more famous than Saratoga and Yorktown. It was the first time in American history that such an event had occurred, which circumstance of itself was sufficient to lend interest to the occasion. Lincoln, with several members of his Cabinet, was present, together with many of the nation's most illustrious statesmen and soldiers. It was a cloudless and perfect autumn day, and thousands from far and near were assembled on the forever famous battlefield to listen to the oration of New England's most distinguished and classic living orator. Delivered with his accustomed grace, Edward Everett's long address was smooth and cold, lacking a single stirring thought, vivid picture or patriotic appeal.

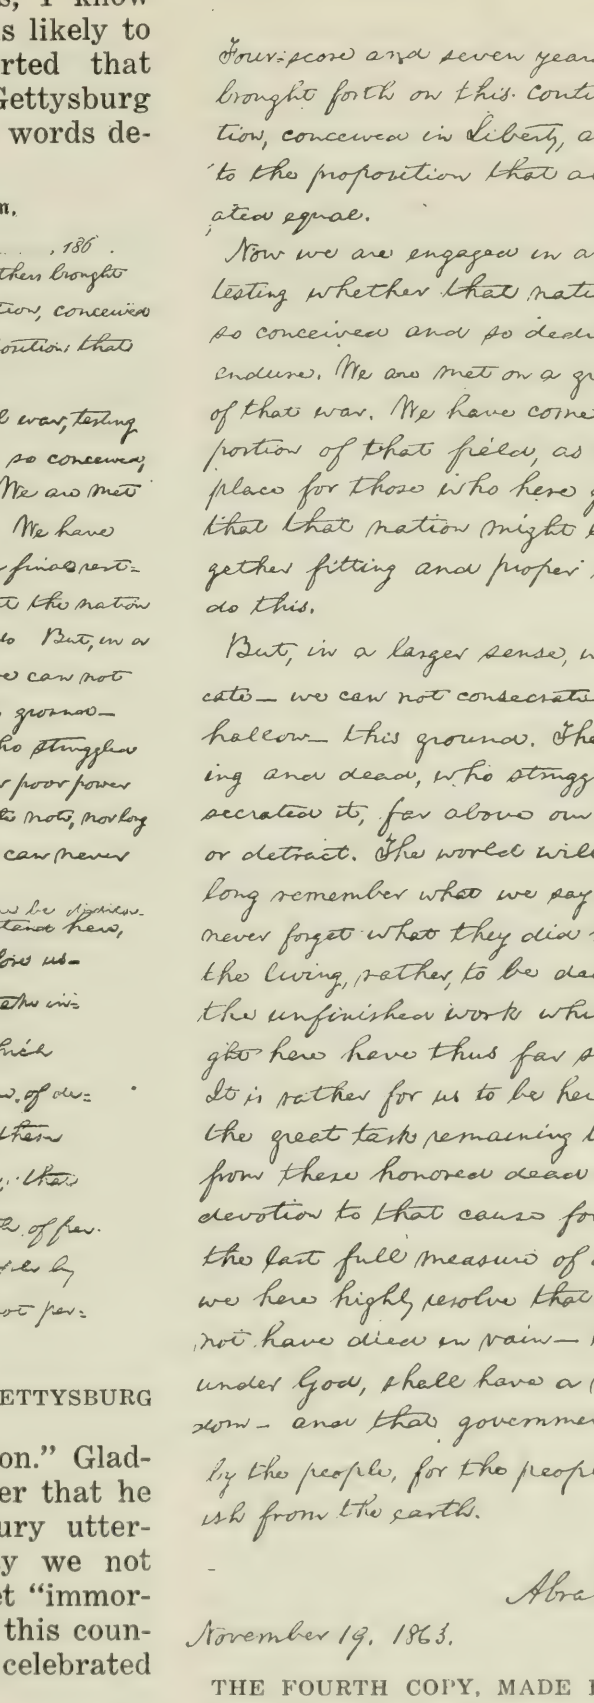
Then followed, at a few minutes before two o'clock, the President's short and simple speech, so felicitous and so perfect. Not a sound broke the solemn stillness. The immense audience that was within the sound of his strong tenor and far-reaching voice listened almost breathlessly during its delivery, which occupied precisely 135 seconds. While holding his manuscript of two sheets in his left hand, Lincoln made no use of it. As on the occasion of the President's second inaugural address, in March, 1865, there was a loud outburst of applause at its close, but it may be questioned if, either at Gettysburg or the nation's capital, these brief and perfect examples of English oratory were fully appreciated. They were the crowning efforts of his career as a public speaker. Had Abraham Lincoln made no other, these two gems of our language would

have sufficed to have won for him everlasting renown as an orator. Except Washington's farewell address, I know of no important writing that is likely to outlive them. Emerson asserted that "Lincoln's brief speech at Gettysburg will not easily be surpassed by words de-

Executive Mansion.

Washington, ... , 186 .

Four score and seven years ago our fathers brought forth, upon this continent, a new nation, conceived in liberty, and dedicated to the proposition that "all men are created equal"



Now we are engaged in a great civil war, testing whether that nation, or any nation so conceived, and so dedicated, can long endure. We are met on a great battle field of that war. We have come to dedicate a portion of it, as a final resting place for those who died here, that the nation might live. This we may, in all propriety do. But, in a larger sense, we can not dedicate — we can not consecrate — we can not hallow, this ground — The brave men, living and dead, who struggled here, have hallowed it, far above our poor power to add or detract. The world will little note, nor long remember what we say here; while it can never forget what they did here.

It is rather for us, the living, we here be dedicated to the great task remaining before us — that, from these honored dead we take increased devotion to that cause for which they here, gave the last full measure of devotion — that we here highly resolve these dead shall not have died in vain; that the nation, shall have a new birth of freedom, and that government of the people by the people for the people, shall not perish from the earth.

MANUSCRIPT LINCOLN TOOK TO GETTYSBURG

livered on any recorded occasion." Gladstone said to the present writer that he "knew of no nineteenth century utterances comparable to it." May we not apply to the address the epithet "immortal," used by Kossuth when in this country, in speaking of Webster's celebrated Hulseman letter?

On the day after the dedication Mr. Everett wrote to the President: "Permit me to express my great admiration of the thoughts exprest by you with such eloquent simplicity and appropriateness

Address delivered at the dedication of the Cemetery at Gettysburg.

Four-score and seven years ago, our fathers brought forth on this Continent, a new nation, conceived in Liberty, and dedicated to the proposition that all men are created equal.

Now we are engaged in a great civil war, testing whether that nation, or any nation so conceived and so dedicated, can long endure. We are met on a great battle-field of that war. We have come to dedicate a portion of that field, as a final resting place for those who here gave their lives, that that nation might live. It is altogether fitting and proper that we should do this.

But, in a larger sense, we can not dedicate — we can not consecrate — we can not hallow — this ground. The brave men, living and dead, who struggled here, have consecrated it, far above our poor power to add or detract. The world will little note, nor long remember what we say here, but it can never forget what they did here. It is for us the living, rather, to be dedicated here to the unfinished work which they who fought here have thus far so nobly advanced. It is rather for us to be here dedicated to the great task remaining before us — that from these honored dead we take increased devotion to that cause for which they gave the last full measure of devotion — that we here highly resolve that these dead shall not have died in vain — that this nation, under God, shall have a new birth of freedom — and that government of the people, by the people, for the people, shall not perish from the earth.

Abraham Lincoln

November 19, 1863.

THE FOURTH COPY, MADE FOR BANCROFT

at the consecration of the cemetery. I should be glad if I could flatter myself that I came so near the central idea of the occasion in two hours as you did in two minutes." Another less distinguished

person who was present writes: "I stood close by and heard that speech delivered. It came upon us, after the ponderous and elaborate rhetoric of Edward Everett, like a blaze of real fire after a matchless picture of fire. It sprang, like the strophes of old, out of a chastened heart, almost broken with the weight of conquest, but still dauntless in its American faith; and the man who spoke the words was for the moment transfigured for us, and his furrowed face and gaunt form took on the light that never was on land or sea, so that he became the archetype of the people themselves, uttering, better than he knew, the great prayer of that finer and better humanity that our fathers and we believed was to come with liberty and equality out of storm and stress."

Said Stanton, the great War Secretary, referring to the two addresses: "Mr. Everett has made a speech that will make three columns in the newspapers, and the President has made one of perhaps forty or fifty lines. Everett's is the speech of a scholar, polished to the last possibility. It is elegant and it is learned; but Lincoln's speech will be remembered as long as anybody's speeches are remembered who speaks in the English language." "This was the truth," adds Charles A. Dana, who relates the incident. "If you will compare these two speeches now you will get an idea how superior genius is to education—how superior that intellectual faculty is which regards everything with the fire of earnestness in the soul—with the relentless purpose of a heart devoted to objects beyond literature."

The President made five copies of the world's masterpiece of rhetorical art. Two were written before its delivery and three were written after his return from Gettysburg. The first was finished the day before his departure from Washington, and on his arrival at Gettysburg Mr. Lincoln made a few slight alterations on the second sheet. This is the copy which he held in his hand, but, as already stated, he did not refer to in its delivery. It was long in the possession of his secretary and biographer, John G. Nicolay, to whom it was presented by the President, but since his death has unfortunately disappeared, and nothing is now known of it. Luckily it was facsimiled before its loss, and a copy accompanies this article.

The second copy is almost a duplicate of the first, and is believed to be the one its author intended to take with him to Gettysburg, but which in some way was overlooked or forgotten and later, on his return to Washington, was presented to Col. John Hay, and is now in the possession of his family. The third copy of the address was made by Mr. Lincoln at the request of George Bancroft for the Maryland Soldiers' and Sailors' Fair, held in Baltimore in the spring of 1864. Having been inadvertently written on both sides of a sheet, it was unavailable for the purpose of lithographic reproduction in fac-simile in a volume entitled *Autograph Leaves of Our Country's Authors,* sold for the benefit of the fair, and the President was requested by Mr. Bancroft to make another copy, at the same time granting the historian's wish to retain the first transcript of the address. This is preserved by Mr. Bancroft's family. The fifth copy of the Gettysburg address was also made early in 1864, at the request of Mr. Everett, to be bound with the manuscript of his oration and the President's letter to him of the 20th of November, 1863, in a volume to be sold at the New York Metropolitan Fair for the benefit of the United States Sanitary Commission.

It may be mentioned that among the many differences to be found between the first two versions of the address and the three later ones, the most important are the words "under God," which were interpolated by Mr. Lincoln as he spoke, for they do not appear in the Nicolay or Hay manuscripts, but are a part of the President's final revision, which is, of course, the one that will be inscribed in the Lincoln monument to be erected by the nation in Washington.

Lincoln asserted of the soldiers who fought at Gettysburg that the world would little note or long remember what he said, but that it would never forget what they did. This statement is not true; the words of the orator have had a longer and more memorable life than the deeds they immortalized, and will be remembered thru all the endless and everlasting ages.

New York City.

Science and Journalism

The Opportunity and the Need for Writers of Popular Science

By Edwin E. Slosson, Ph.D.

[The following is the substance of an address given on April 14, 1913, before the School of Journalism of Columbia University by one of the editors of THE INDEPENDENT, who is also an Associate in the School.—EDITOR.]

In accordance with the journalistic rule that every headline shall contain a verb, the title given above might well be made to read "Science Is Journalism." This would be almost literally true, for practically all scientific work appears in journals and very little of it ever gets into print in any other form. Go into any of the scientific libraries of a university and you will find that about nine-tenths of the volumes are bound sets of periodicals and the rest of the books are for the most part either mere indexes to these periodicals or handbooks based upon them. In case of a fire you would see the professor rush to the rescue of his beloved journals, and not till those were all safe would he try to save the books. When a student is told to "look up the literature" of his subject it means that he is to devote his days and nights to the following of his clue thru the mazes of the files. And with what eagerness and anxiety he scans the table of contents of the latest number of the journal of his specialty, for he may discover that some German student has scored a beat and that he has lost his years' work on the eve of his triumph. Then his heart is seized with the deadly chill of disappointment, as was Scott's when he reached the South Pole and found the Norwegian flag planted there by his rival.

But we must avoid the common error of thinking that because periodical literature represents the most modern thought that therefore the journal which appears most frequently is the most modern. The daily is not always up-to-date, even when it is dated a day ahead. The most unreliable thing about the news is its date line. You may find in a supposititious cablegram from Peking of the day before matter that appeared in the London *Times* the week before, in the Shanghai *News* the month before, or in the *Encyclopedia Britannica* twenty years before. It might even be asserted with some plausibility that the modernness of a periodical is in inverse proportion to its periodicity. The quarterlies and monthlies of science and scholarship contain the most advanced thought of the day, then follow the weeklies, while the dailies bring up the end of the procession, some ten or twenty years behind the head. Of course, a scientific discovery of a spectacular character is often reported promptly in the newspapers with tolerable accuracy, but this has no effect on the tone and standards of the paper as a whole. This is not saying anything derogatory of the daily. It is inevitable that a journal of wide circulation should reflect the mentality of the million. A leader of public opinion must always remain within shouting distance of the public. The scouts and skirmishers on the farthest front of human knowledge have greater freedom of movement because they are mostly out of sight of the multitude.

The most radical ideas of our day are not so apt to be found in the popular newspaper or in the queer little insurrectionary, heretical and propaganda sheets that we occasionally see, but in the technical journals and proceedings of learned societies. The real revolutions are hatched in the laboratory and study. The papers read before the annual meetings of the scientific societies, and for the most part unnoticed by the press, contain more dynamite than was ever discovered in any anarchist's bomb shop. Political revolutions merely change the form of government or the name of the party in power. Scientific revolutions really turn the world over, and it never settles back into its former position. When Karl Marx in 1869 published *Das Kapital*, it created a great commotion which has not yet subsided. But no atten-

tion whatever was paid by the journals of the day to a much more revolutionary work that appeared three years before, in the Proceedings of the Natural History Society of Brunswick, a paper entitled *Versuche über Pflanzen Hybriden*, wherein Abbot Mendel told of his experiments in the crossing of sweet peas. This paper gave the clew to the laws of heredity which control not only plants and animals, but human beings as well; and whether future generations shall be "mostly fools," as Carlyle said, or mostly sane and intelligent people with a good sprinkling of genius, depends simply upon how well we learn the lesson taught by the Augustinian monk in 1866. No man who ever lived has been more written about than Napoleon Bonaparte, yet nothing he did has had as much effect upon the world as had Michael Faraday when he discovered that passing a coil of wire in front of a magnet would generate an electrical current, for this was the origin of the dynamo and the motor. The scientist produces the wealth that employer and employee quarrel over. Socialism and capitalism are alike merely by-products of the laboratory.

Yet with all this, the dominant attitude of the popular press toward men of science is one of contempt and ridicule. Confronted on every side with the conspicuous evidences of scientific achievement and the marvelous transformation it has effected in the industry and society, yet the newspapers and magazines rarely give science the recognition that it deserves by reason of its real importance and intrinsic interest. Sometimes, indeed, a feature writer with an unusually keen scent for a news story will delve into a technical journal or sneak into a classroom and drag out something to hold up before the multitude for their amusement or execration. One of the most sensational series of articles in one of the most sensational of our monthlies was obtained by the simple expedient of sending a man around to the universities to gather up fragments of the sayings of various professors. The material so collected was innocuous enough, much of it, indeed, quite commonplace and undisputed opinions and not by any means extreme utterances, yet because of the spicy way in which it was dished up and because it was novel and unconventional, the public were shocked, and not a few zealots were roused to a point where they would have been glad to see the universities burned down.

As seen thru the medium of the popular press the scientist is apt to appear as an enemy of society or as a curious, half-crazy creature talking a jargon of his own and absorbed in pursuit of futilities. I am not objecting to the caricature of scientists. We caricature everybody all the time. There is no closed season when it is forbidden to make game of any public man. But it is distinctly unfair to present the scientist only in caricature. Suppose the managing editor should send the editor of the love-lorn column to write up a baseball game, and she should come back with a story of how a dozen crazy men in queer clothes raced around in the hot sun, and how one man tried to hit a stick with a ball and couldn't because the other man moved it around so, and how one man caught the ball and another man ran after him and they got into a fight over it until another man in plain clothes came up and stopped them. Such a report of a league game, if cleverly done, might be read with enjoyment even by a fan, but only once; if the sporting page contained nothing but that sort of stuff he would stop the paper. Now, the average report of a scientific lecture or paper is not a whit better than that. It is as incomprehensible to the scientist and the layman as to the reporter who wrote it.

This failure of the newspaper to deal adequately with scientific happenings is in conspicuous contrast with its success in handling other human interests. The political editor understands his business. The financial reporter can use the language of the Stock Exchange. The critics of art, music and drama know what they are talking about, or how to appear to. The men who write up prize fights or divorce cases, the ladies who prescribe for bad complexions or broken hearts, have acquired a familiarity with their respective fields which enables them to give to their opinions a weight often far in excess of their intrinsic validity.

The degree of accuracy obtained in the immense mass of facts accumulated every day for the newspaper is one of

the marvels of the age, and the newspaper has developed a new style of expression which is rapidly invading all other fields of literature. You can find in any paper news paragraphs which for clarity, conciseness and exactitude will compare favorably with the best scientific textbooks.

But when it comes to science itself the ordinary reporter is all at sea. He does not understand the language of the laboratory. He does not know what he sees. He cannot distinguish between new and old, between the significant and the trivial. His nose for news has lost the scent. His story becomes confused and conscious of incompetence.

To the journalist there is something saddening about a great university. He is distressed to see so much good copy going to waste all the time. Here is a great knowledge factory in full blast, turning out books and monographs and well packed craniums; yet a large part of its profit is lost because there is nobody to gather up the by-products and put them into marketable shape. Every doctor's dissertation contains a good newspaper story concealed in it. A man could make a very fair living translating them into English. A single sentence of the thousands that are daily lavished upon the inattentive ears of college students will suffice when properly diluted to provide material for an editorial of average length and consistency.

It is the business of the journalist to build bridges across the chasms which divide humanity, to act as interpreter between those who speak different languages. We have on the one side a public mostly indifferent to the doings of scientific men. We have on the other scientific men who too often are indifferent to the public. There is an esoteric tendency in science as in all professional work. I was once, in talking to a distinguished scientist, deploring popular ignorance of modern research. "The public does not know what is being accomplished in the laboratories," I said. "Why should they?" he retorted. "It is none of their business."

This attitude is quite natural. It is no advantage to the investigator to be written up. On the contrary, it usually injures him in the estimation of his colleagues without gaining for him the esteem of any one else. The journalist often destroys a reputation in the attempt to make one. The career of many a promising young man has been ruined thru the premature and sensational exploitation of his discoveries. Popular applause is only a disturbance to the investigator if he does listen to it, and if he does not listen to it so much the worse for him.

That is one reason why each science develops a language of its own. A technical vocabulary serves the purpose of a private telephone system connecting members of the same gild so they can talk to one another anywhere in the world without being overheard and interrupted by outsiders The sciences that make most progress are those that have the best cryptograms. Mathematicians, physicists and chemists can pursue their researches for years undisturbed, for the layman, not understanding the language, does not venture to interfere. But the psychologists, sociologists and economists have difficulty in accomplishing anything, because they use much the same language as everybody else, and consequently everybody else thinks he understands what they are talking about and takes part in all of their discussions.

But while we must recognize that a secret language has its advantages in securing freedom for the logical development of a science, yet there is need for the interpreter to bring the results of scientific investigation as quickly as possible to the knowledge of those who are to put them into effect. Such intermediaries the universities ought to turn out in abundance. Unfortunately, the specialization inside the university has been carried so far as to cause a division of labor that is neither efficient nor economical. English has in recent years developed into a department by itself, and as a consequence the other departments are apt to be left without any English. One wing of the faculty devotes itself to form, the other wing to matter. The student who divides his time between them rarely realizes that the two things belong together. It is no wonder, for his instructors in either or both wings often do not realize that the two things belong together. The litterateur

sneers at the scientist and the scientist returns the compliment with interest. The more the student concentrates his work the worse he comes out. If he specializes in language he acquires an elegant style but has nothing much to say with it. If he specializes in science he will know a great deal but he will have no style about him. The result is that the graduating class of a college has come to resemble in mental equipment the natives of the South Sea island, where, the supply of clothing being short, they divided up and appeared at church half of them wearing coats and the other half trousers. This divorce between matter and form, between the idea and its expression, is a serious defect of our educational system. I suggest that it would be well if some university should take as its motto *E pluribus unum* and teach the unity of knowledge, training its graduates to see both sides of the shield. Here perhaps is the function of a school of journalism. For the journalist realizes as no other man that his work is only half done when he has got his facts right. He must then put his facts into such shape that they will produce their full effect upon other people. The journalist no sooner gets something than he wants to give it to somebody else. He is as generous as a schoolboy with the mumps.

The scientist, pure and simple, is concerned only with the accumulation of knowledge. He usually does not care to bother about its dissemination. If he hears applause he wants the gallery cleared at once. But he is rarely troubled that way. For the most part the world is content to ignore him and leave him in peace to his own devices. What he writes is unread except by the few who are specially interested in the same specialty. And sometimes even they are not able to read it without propping their eyelids up with toothpicks. The generation of Darwin, Tyndall and Huxley has gone and there seem to be none to succeed them in the ability to make science attractive thru the charm of their literary style. In consequence of this unfortunate feud between the literary and scientific wings of the faculty, the great mass of scientific literature remains unassimilated and unutilized. Papers of the highest importance are sometimes quite buried and may be accidentally unearthed years after the world might have profited by the discoveries therein contained. Many a scientific paper should properly bear the inscription we sometimes see on the title page of a book, "Printed but not published."

It is, then, not merely because of mental inertia that the average of public opinion lags some ten or twenty years behind scientific thought. It is partly because of lack of opportunity to become acquainted with the recent results of scientific research. Public ignorance has naturally been followed by public indifference. Time was when the microscope and Atlas of the Heavens formed a part of every gentleman's library; when "Shakespeare and the musical glasses" ranked together as topics of London conversation; when culture was held to include an acquaintance with the latest thing in science as well as in art or music. But nowadays a man who would be ashamed to confess ignorance of Matisse or Strauss does not manifest the least curiosity to know of Thomson or Morgan.

But this popular ignorance and indifference in regard to science can readily be remedied. The beauty and meaning of scientific discoveries can be revealed to the general reader if there is an intermediary who can understand equally the language of the laboratory and of the street. The modern journalist knows that anything can be made interesting to anybody if he takes pains enough with the writing of it. It is not necessary, either, to pervert scientific truths in the process of translation into the vernacular. The facts are sensational enough without any picturesque exaggeration.

It is not impossible to find in periodical literature instances of marked success in the writing of popular science. There are two brothers named Duncan. One of them went to Labrador, the other went to the laboratory. Both knew how to write. Both became famous. The same public which reads with delight about Dr. Luke as told by Norman Duncan reads with equal delight about the latest discoveries in chemistry as told by Robert Kennedy Duncan.

Our literary magazines having

dropped their scientific department because they decided that it did not pay to print science, it was left to other magazines to take it up and make it pay. I see on the latest issue of *Popular Mechanics* that its circulation is 370,000, a statement that the literary magazine despising science would be most happy to print upon its cover. Yet *Popular Mechanics* did not gain its popularity by faked or sensational science. It simply cut science up into small enough mouthfuls so that the average man could swallow it. The same may be said of *Technical World* with 125,000 circulation, and of *Popular Electricity* with 75,000. These popular science monthlies have come to the front within a very few years. The pioneer in this field, the *Scientific American*, has always been the despair of librarians because it gets read to pieces before the time comes to bind it. Then there are innumerable technical and trade journals that publish a great deal of scientific matter.

The field, then, is not an unprofitable one even in the mercenary sense. To higher motives the task of popularizing science makes a still stronger appeal. Ignorance is the source of most of our ills. Ignorant we must always be of much that we need to know, but there is no excuse for remaining ignorant of what somebody on earth knows or has known. Rich treasure lies hidden in what President Gilman called "the bibliothecal cairn" of scientific monographs which piles up about a university. The journalist might well exchange the muckrake for the pick and dig it out.

Nothing could accelerate human progress more than to reduce the time between the discovery of a new truth and its application to the needs of mankind. This delay has already been reduced to a few years or months in the case of the utilization of minor discoveries in physics or chemistry, but in the realization of the more fundamental truths affecting life and society there is often a delay of a generation. Think of the thousands of lives lost in the interval between the discovery of the antitoxin for diphtheria and its general use. It is regarded as a great journalistic achievement when the time of transmission of a cablegram is shortened. But how much more important it is to gain a few years in learning what the men who are in advance of their age are doing than to gain a few seconds in learning what the people of Europe are doing? This lag in intellectual progress, this hysteresis, if I may employ an electrical term, is something which it is the especial duty of the journalist to remove. He likes to score a beat of a few hours. Very well, if he will turn his attention to science he can often score a beat of ten years. Let him use half the zeal in running down a new idea that he does a society scandal and the world would be benefited.

I have talked hitherto about the journalism of science. There is another and more remote topic that I should have liked to discuss if I had the space; that is, the science of journalism. Back of every art there is a science, and the art is all the better for the backing and for the recognition of it. I think that the School of Journalism will in time find that its duty extends beyond the training of reporters and editors and will develop a department of graduate study and research. There are hundreds of subjects that need investigation: questions of paper and printing, of format and make-up, of the best design of type face for legibility and beauty. There are graphical methods for the handling of statistics to be worked out and new forms of illustration. We must go into partnership with the studio as well as with the laboratory.

The history of literature has also to be studied from the standpoint of journalism, for too little attention has hitherto been paid to the influence of the journal on literature of other forms. In the field of sociology there is abundant pasturage for herds of journalistic doctors in the investigation of the effects of the newspaper and the telegraph upon national life.

Then, too, we see developing an entirely new form of journalism which discards the printing press and employs the motion picture. Already in Italy it has become customary to drop into the *cinema* daily instead of buying a paper. Here for the same price one can really see the thing instead of merely reading what has been written about it by some unknown person who may perhaps have

seen it. One may be a witness of the events that occurred in his own city during the day and in neighboring countries a few days before, the floods and fires, the launching of vessels and the flight of aeroplanes, the marching of soldiers and suffragists, the coronations of kings and the inaugurations of presidents. It is a visual instead of a verbal journalism.

More than all else the journalist needs the spirit of science, the vital impetus of perpetual progress and the limitless vision of the future. He must realize that the language he uses is not his alone, but belongs as well to posterity, that it has been developed by long and persistent labor in the past, and that it is his duty to see that the improvement goes on. We need new words, new spellings, new grammatical forms, new modes of punctuation and new literary styles. We shall get them somehow and some time, for language is a living thing which can be guided but not stopped. The only question is whether these changes shall come by hazard and caprice or in accordance with a well considered plan. The making of our language is today largely in the hands of journalists and must be even more so in days to come. The only question is whether it will be done by scientifically trained journalists with a view both of historical perspective and of future advantage, or whether it will be done by men who regard language as something to be maintained unaltered or to be distorted to suit the whim of the moment.

We have passed beyond the era of Darwin into the era of Bergson. We no longer believe that evolution, whether of life or language, is necessarily a slow and painful process dependent upon the accumulation of accidental variations and the struggle for existence. We believe nowadays in creative evolution, in the making of the new things we need, not waiting for things to happen. The chemist of today is an inventor, not a discoverer. He draws up in advance the diagram of the compound he is going to make. The physician of today does not depend upon the chance of finding in some tropical plant the drug he wants. He goes into the laboratory and makes it. The breeder of plants and animals picks out the qualities he wants and puts them together in the form of a new species. The journalist as he becomes a scientist will realize that language is plastic and may be reformed or deformed by his hands. Then we shall see definite progress in the art of expression corresponding to our progress in the accumulation of knowledge.

The Dittany

By Madison Cawein

The scent of dittany was hot.
Its smell intensified the heat;
Into his brain it seemed to beat
With memories of a day forgot,
When she walked with him thru the wheat,
And noon was heavy with the heat.

Again her eyes gazed into his
With all their maiden tenderness;
Again the fragrance of her dress
Swooned on his senses; and, with bliss,
Again he felt her heart's caress
Full of a timid tenderness.

What of that spray she plucked and gave?
The spray of this wild dittany,
Whose scent brought back to memory
A something lost, beyond the grave.—
He knew now what it meant, ah me!
That spray of withered dittany.

How many things he had forgot!—
Far, lovely things he'd flung away.—
And where was Love now? Who would say?
The dittany, whose scent was hot,
Spoke to his heart: and, old and gray,
Thru the lone land he went his way.

Behind Fraternity Shutters

A Frank Statement of What Membership in a Greek Letter Society Did for One College Student

By H. E. Wade, $\Delta\Phi$

[Now when college secret societies are being subjected to criticism from many quarters, and bills prohibiting them are under consideration in some State legislatures, it is interesting to read this frank defense based upon the personal experience of a student in New York University.—EDITOR.]

Four years ago I was a freshman, small, freckled, bashful. And for a few months my time was occupied in much the same way that many another first-year man's has been, except that the moments spent by them in making friends and getting into college activities I was forced to put in trying to pick up an occasional dollar. Not that I made many friendly overtures toward others. Few freshmen do. Yet the chances my classmates had to meet each other and men of the upper classes at smokers, on the gridiron or in the fraternities, were denied to me.

Sometimes I imagined that my clothes, remarkable for their out-of-dateness and unfamiliarity with a tailor's shop, had something to do with my inability to mix with the other fellows. Then again I would decide that my little, box-like room, wedged under the eaves of a dingy boarding house some twenty minutes' walk from the campus, to which I was ashamed to take any of my acquaintances, was the cause of my loneliness. But I finally concluded that it was simply lack of money, for I could spare scarcely a cent for any function, and I let it go at that.

To make matters worse, I fell behind in my studies. That I spent as much time on them as the average man I was sure, yet there was something I lacked. Little did I realize that it was nothing more than the guidance, encouragement and advice of an upper-classman who knew exactly what a freshman year was like and had more than a passing interest in my welfare. Yet being ignorant of this, I kept on working, grinding and failing.

One day in early spring I stole a few minutes from my tiresome routine to watch baseball practice. How I longed to get out on that field and show some of the awkward recruits how to play the infield! Back home I had captained the high school team for two years, but nobody knew that here, and little odds it would make if they did. For my Saturdays were taken up helping figure the payroll of a construction company, and I could spare no time for baseball.

The 5.30 bell rang and I started toward the commons, where I waited on table, pausing but once to look back at the knots of students gathered idly here and there about the campus. I was about to cross the main walk when I found my path blocked by a pair of tall, well-built lads. One was a sophomore and the other I recognized as the junior president.

The soph demanded to know where my freshman cap was. I explained that it had been stolen by a couple of his classmates and that I meant to purchase another as soon as I could spare the money, altho this acknowledgment of poverty made my face grow warm as it had many times before. But I had not settled the matter.

During the words that followed I intimated that if he worked as hard as I for the cash that bought his hats he would go bare-headed. We were rapidly becoming belligerent when our argument was stopped by the junior, who to my surprise invited me to his fraternity that evening.

My first meeting with the members of the frat to which I now belong was more than a surprise to me; it was a revelation. The marks of luxury and extravagance that I had always connected with fraternity houses were lacking. Nor did the men at any time relax into that state of care-free hilarity in which popular opinion places them. On the contrary, each seemed up to his eyes in business. I had a chance that evening to see some

of the inside management of the baseball team, to hear a lively debate between the chairman of the Junior Prom and the junior president over the advisability of allowing flowers to be worn at the dance, and to meet three prominent men from my class who, by the way, were made to study two hours during my stay under the watchful eye of a senior, so that their low marks of the last month in history might not be repeated.

From that night on my life in college changed. I became a frequent guest at the fraternity, and thru my newly made friends gained acquaintances right and left on the campus. Then just before finals I was astonished by an invitation to join the frat. I had not dreamed that I was creating the impression that I could afford to belong to a Greek letter society. But in answer to my refusal on these grounds it was proven to me that I could better afford to live at the fraternity house than in my present quarters. I therefore accepted.

To pay for my board in the house I was made steward. I superintended the buying and planned all the meals. This was hard at first, but one of the fellows who had formerly held the position helped me out until I learned my duties. For my fraternity expenses I was allowed to borrow from a fund held for such purposes. And no sooner was my position made known to our alumni than, thru their influence, I secured a scholarship.

Each blow of good luck left me breathless. Yet I was not long in divorcing myself from the hot little room under the eaves, nor did I waste much time before starting to work with the intention of getting off my conditions acquired at mid-years. As special advisers I was given a brother in the faculty and an upper classman. Things that had formerly taken me an hour to accomplish they taught me to do in twenty minutes; lectures in which I had failed to take the proper notes they dug up for me in the notebooks of former students filed away in the fraternity book-room; and problems that had from the start tied themselves in knots they showed me how to unravel in record time. As a result I hit my finals between the eyes and was not flunked in a single course.

At the beginning of my junior year I found myself in politics. The college political game I soon discovered was as intricate as that of a democracy and much more uncertain. Yet here again the popular opinion that fraternities dictate who shall be elected, and that they can put thru any kind of a man, I found to be wrong. Of course, there was a well-defined balance of power among the societies, but they had long since been taught that the you-give-us-this-and-we'll-give-you-that policy would not work. No undemocratic or overbearing candidate could ever hope to be placed in any office by his class. And it was early imprest upon me that the only route to class leadership was to meet all my classmates, get acquainted with most of them, and become intimate with many. This I tried to do, and as a result was made vice-president.

In the meantime I broke into baseball and again had the fact demonstrated to me that a new man can seldom get ahead in college activities without the piloting of a more experienced fraternity brother. During my first season's practice I became discouraged at not making the team. Had I still been living my hermit's life at No. 10, third floor back, I should no doubt have given up. But when asked by a senior whether or not I thought it the spirit of the fraternity that its members try for athletic honors and quit cold because they failed to receive them the first year, I saw a light and followed up my first season's practice with a try the following year, this time with better success.

Next month I get the sheepskin for which I have plugged four years. Do I hate to leave? I should say I do. Would I —if I had continued to live my life under the eaves? Draw your own conclusions.

New York University.

THE NEW BOOKS

What Germany Is Doing

Now that Germany has become a world power and challenges the supremacy of Great Britain on both land and sea, it is important for us to understand by what means she is making such rapid strides toward the front. Several books have appeared recently to enlighten us, and one of the most interesting, because of its clarity and conciseness, is Elmer Roberts's *Monarchical Socialism in Germany.*[1]

The American reader familiar with the way government enterprises are run in his own country will have his eyes opened at the first page when he learns that the federated German states derive 38 per cent of their financial requirements from government-owned enterprises. The state property consists chiefly of farms, forests, mines, railways, telegraphs, telephones, express and mails, each of which pays a profit. Altogether the imperial and state governments took profits in 1911 amounting to nearly three hundred millions from various businesses conducted by them.

In the United States the Democratic and Republican parties vie with each other in their zeal for trust-busting. In Germany all parties are agreed as to the desirability of trusts and the Government favors and even in certain cases compels their formation. In America we prohibit rebates and discriminating rates by railroads. In Germany rebates are established wherever it is thought they will benefit commerce. For example, a manufacturer shipping goods intended for export may pay less than a third of the regular railway rate and tariff charges are arranged with the expectation that he will sell his product at less than he charges at home, a thing abhorrent to the American mind.

In *Socialism and Democracy in Europe*[2] Dr. Orth gives a comprehensive and impartial survey of the labor movement in various countries. The author finds that socialism has already accomplished three notable things: first, it has spread democracy, resulting in an extension of the suffrage; second, it has forced the labor question upon the lawmakers, causing attention to be paid to such matters as hygiene, unemployment and education; and, third, it has caused an extension of the functions of the state so that it enters into new fields for the common good. Dr. Orth believes that the socialistic dream will never be realized, but that socialism as it gains power becomes more practical and less revolutionary. A valuable feature of the book is the appendix containing a bibliography and the platforms of the Socialist and Labor parties.

Principles of Prussian Administration[3] by the Adjunct Professor of Government in the University of Texas is a thoro study written in the style of a doctor's dissertation and stating in detail the organization of the Government, the powers and functions of its various departments, and the character of legislation. No attempt is made to criticise the results of the administrative measures or to compare conditions in Germany with other countries.

Of a very different character from any of the books just characterized is Lichtenberger's *Germany and Its Evolution in Modern Times,*[4] translated from the French. This is not so much concerned with industry, politics or administration as with fundamental ideals and their influence upon religion, art, and national policy at home and abroad. The author strives to assume an absolutely impartial and objective standpoint, tho such an attitude is perhaps not so possible or so desirable as he thinks. He finds the dominant force of the rise of Germany in Nietzsche's "will to

[1] *Monarchical Socialism in Germany.* By Elmer Roberts. New York: Charles Scribner's Sons. $1.25.
[2] *Socialism and Democracy in Europe.* By Samuel P. Orth. New York: Henry Holt & Co. $1.50.
[3] *Principles of Prussian Administration.* By H. G. James. New York: The Macmillan Company. $1.50.
[4] *Germany and Its Evolution in Modern Times.* By Henri Lichtenberger. Translated by A. M. Ludovici. New York: Henry Holt & Co. $2.50.

power." The Germans have achieved their astonishing success thru their unique combination of personal initiative and discipline, of competition and combination. In the domains of religion and esthetics he notes a reaction from rationalism and materialism toward mysticism and idealism. The translator should have annotated the book and brought it up to date. It might have been well, for example, to have corrected the statement thrice repeated that socialism received a setback "in the last election," meaning that of 1907, since now it is stronger than ever, and to have noted that the Von der Golz reform of the Ottoman army did not prove to be a striking success. Herr Dernburg, the energetic Colonial Minister, whom Mr. Lichtenberger presents in the hight of his power and popularity, has since been forced out of office and his policy repudiated.

Human Quintessence

What has the son of Ibsen to say, that he should put aside a diplomatic career and at fifty address the world not in plays, but in philosophical essays? A man's message must mean something to himself at least, if speaking it out is worth being a prime minister, as Sigurd Ibsen has been.

His book, *Human Quintessence* (Huebsch, $1.50), is indeed a message to his time, exprest in four essays, of which the first, "Nature and Man," gives the dominant note. The opening words catch the heart with their good-humored concession that as we admit a good many scientific truths to our brains without letting them into our lives, as we do homage to Copernicus but follow Ptolemy, the sun "rising" for us not only in our speech, so, however, heartily we admit Monism as a principle, we stop quite short of the least application of it to practice. The universe is interesting to us, whether selfishly or not, as the home of man, and if we succeed in merging our personality in the cosmos, it is by enlarging it to take the cosmos in.

Nor would Dr. Ibsen have it otherwise. He sees man as a stranger in the universe, alone in the midst of nature, upon which he confers, out of his own idealism, out of his own need for justice, kindness, right, qualities of which nature itself has no trace. Because man cannot live without a sense of universal justice, he attributes it to nature, throwing upon it the shadow of his own soul. We have long since outgrown the cozy notion that rain descended to nourish our crops, or day alternated with night to ensure our repose; we have learned that natural law cares little enough for the man that gets in its way: now we are to question whether, in the sense that man gives to the word, there be in nature such a thing as progress at all, or whether what we call development may not be only change. The survival of the fittest does not mean the survival of the best, but of the fittest to survive—which in the case of poisonous insects in a swamp may not be at all the same thing. Everywhere in the nature to which some would have us return, we see evidences of a lack of valuation. Nature disposes of Curie by letting a truck run over him; no natural law has been broken, but the heart of man burns at the thought of waste, the sense of disproportion between his death and its cause. It is in this sense of proportion, this power of valuation, that Sigurd Ibsen finds the nucleus of that "human quintessence" that he would have mankind intensify. Nature is not to be followed, but governed; the arbitrariness of natural processes regulated by conscious activity. "The only providence that reveals itself, lies in ourselves: in our maintenance of the human over the natural."

In one of the dream-pictures of the dying Turguenev, he disclosed Nature, brooding in her cavern, not over the affairs of men, but how to strengthen the muscles of a flea's legs so as to maintain the balance between attack and defense, and when he speaks of goodness, reason and justice she tells him that these are human words—that worms or men make no difference to her—"you defend yourself in the meantime!" But what the Russian was content to leave as a counsel of despair, the Scandinavian has elevated to a call to lordship. It is inevitable that one should read Sigurd Ibsen with an eye open for Henrik, and tho it may seem to be the result of a long look, it is worth noting that the father was never really at home in the country, even as a child; that people always stood between him and the scenery, and that he was most concerned with the will of man, which divides him from the rest of creation.

Madame de Custine

The publishers of *Memoirs of the Marquise de Custine* recommend the volume as the record of an aristocratic eye-witness of the Reign of Terror. As such these memoirs have their value; also as documentary evidence that during the progress of the French Revolution not a few persons were (as always) more occupied with their own

petty jealousies and love affairs than with changes in the Constitution. But Madame de Custine paid dearly for her sins of lightness; the condemnation and execution of her father-in-law and slighted husband were real blows, and so was her own imprisonment and the narrowness of her escape from the scaffold.

Later on, she came to know on most intimate terms the famous writer whom she had met before the Revolution as a clumsy young provincial: Chateaubriand. Her love for "the Charmer," his sentiment for her, his faithfulness—these are all elements in a career that but for its want of the noble note would have been truly tragic.

Madame de Custine has in Gaston Maugras and the late Count de Croze-Lemercier sympathetic biographers who do not, however, make the mistake of idealizing her character. They have brought to light much unpublished material, and reproduce many letters and passages from the lady's diaries. It is a volume of memoirs of more than average interest to the social and literary historian, and a handsome one. The period is 1770-1826. (George H. Doran Co., $3.)

A Home University

On the wrapper of the volumes in the Home University Library (Holt, 50 cents each) we read an extract from a review in THE INDEPENDENT, as follows: "These are all new books on living issues by living men and women who are vitally interested in their topics." There are now more than sixty volumes in the series, and this earlier review of ours may be applied, without modification, to the series as a whole. Among the recent additions are an account of *Napoleon* by Herbert Fisher (we hope to notice this work at a later date); *The Literature of Germany*, by J. G. Robertson, a useful little handbook; Sir Frederick Wedmore's modest *Painters and Painting*, that makes no attempt to discuss anything in art subsequent to Courbet; John Bailey's *Dr. Johnson and His Circle*—an understanding and delightful volume; and Prof. C. McL. Andrews's *The Colonial Period* (of American history).

Another contributor, Principal J. E. Carpenter, of Manchester College, Oxford, in his brief monograph on *Comparative Religion*, gives an historical view of the Animistic cults of the savage races, of the origin of the ideas of spirits and gods, of sacred acts and products, of the relation of morality to religion, and of the answers given to the problems of life and destiny, but without attempting definitely to show what basis of truth there might be in any form of religion, or any answer to the question of theism. An immense amount of facts is given very compactly, and the reader must interpret these according to his prejudgments.

The volume on *The Origin of Life* by Prof. Benjamin Moore, of the University of Liverpool, begins far back at the very beginning of atomic or electronic constitution of matter, with the creation of stars and planets, and at last passing by the simpler atomic constitution of crystalline matter, reaches what he regards as the extremely important colloid, or gelatinous form of matter, which we see simplest in colloidal silica dissolved in hot solutions; then the more composite colloids, like chlorophyl, out of which he believes that life in a way yet unknown has developed under natural laws. The last half of the book is a clear discussion of the movements of these colloids within the cells of the body and the changes they undergo, by solution and fixation. His conclusion is that life came into the world not from cosmic dust bearing the germs of life, but under the processes of evolution directed by the force of solar heat in appropriate temperatures. But the exact process and stage when life appears he has not discovered. It is a volume well worthy of study.

Mr. G. K. Chesterton's comment upon *The Victorian Age in Literature* is, of course, the most arresting volume among those lately issued. His publishers seem a bit nervous; they "wish to explain" that they do not regard his book "as an authoritative history"—only as "a free and personal statement of views and impressions about the significance of Victorian literature made by Mr. Chesterton at the Editors' express invitation." All this would have gone without saying. Yet the Chesterton handbook is, on the whole, sane and refreshing, as well as brilliant. He does not love the worship of nonconformists, and we are not surprised that a very offensive passage has called for sharp rebuke. Any one who knows Chesterton will be able to imagine something of the book's scope and tendency from such chapter headings as The Victorian Compromise and The Break-Up of the Compromise.

Our last paragraph shall treat of Mr. G. Binney Dibblee's account of *The Newspaper*. Tho this is an Oxford man's production, it does not ignore American journalism, and differences in newspaper ideals and procedures interest its author, as indeed they should. Mr. Dibblee dates the New York *Evening Post*, however, from 1766, instead of 1801, and erroneously names William Lloyd Garrison as one of

the American *Nation's* editors. He is equally mistaken in referring to the New York *Herald* as a leading Republican newspaper. In this country we frequently think of newspaper editorship as decadent—in influence, at least—and of the star reporter as the cock of the walk. The English newspaper reporter is on the decline, it would seem—owing to the intrusion of the great news agencies and the "semi-amateur outside specialist."

Horizon Songs

Running thru the many poems in Grace Duffield Goodwin's book of *Horizon Songs* (Sherman, French, $1.25), one comes back to the nature poems in the first forty pages with a sense that here is her true forte. She is a nature poet, who has taken for her field the prime things—sunrise, sunset, the high edges of the hills, the purity of dawns, the restfulness of evening's approaches. Nature has been to her the stimulating, zestful recovery ground of sanity in thought. Here she gets oriented again after a lapse of clear vision in the wilderness of life. Her nature is sufficiently subjective to make it interesting to talk about. Not descriptive alone, which soon wearies, but the nature that is sympathetic and ready to exchange views with you, on any, the highest questions. Take this, for instance. How prettily she inserts herself at last in her picture. But the picture has all along looked to this end:

No push of buds, no breath of bloom,
No dream of new leaves soon to be;
No dear communion, bough to bough,
In orchard sympathy.
O sad Pine Tree,
Not these for thee,
But all of them at will for me.

A solitude of friendless green;
Winds that have swept a bitter sea;
Wide wastes of midnight sky between
The distant, heedless stars and thee.
Night, silence, wind and stars and sea!
O blest Pine Tree,
Close, close by thee,
I pray thee make a place for me!

Animals and Their Young

The Infancy of Animals, by W. P. Pycraft (Holt), is a natural history of young animals which will be as interesting to the layman as to the biologist. The author has gathered many facts concerning the care which young animals receive from their parents. This phase of biology has never before received systematic treatment. The present writer shows that the post-embryonic development is of equal value with the embryonic as an aid to the elucidation of some of the most perplexing problems of comparative anatomy, physiology, psychology and evolution. The evolution of the instinct of parental care for the young receives a more adequate treatment here than in any earlier volume.

That this instinct in lower animals is by no means confined to the mother is shown in such cases as that of the European toad, where the male, as soon as the eggs have been laid, and fertilized, proceeds to wind these strings of eggs around his hind legs and remain in seclusion for three weeks, stealing forth at night to feed, and bathe the eggs in dew; or of that of the American "bow-fin," where the male helps the female to construct the nest, and after the eggs are laid, takes full charge of the nursery. A particularly noteworthy feature of the book are the numerous illustrations, for the most part original, too, and really illustrative of points made in the text. They add immeasurably to the value of the book, which is altogether a notable addition to the popular literature of science.

Belting the World

In building the 700,000 miles of railroads now in operation in the world, many almost insurmountable difficulties have confronted the engineers, and the masterful resourcefulness and ingenuity displayed in overcoming discouraging situations is the main value of the painstaking work, entitled by its author, Frederick A. Talbot, *The Railway Conquest of the World* (Lippincott, $1.50). The book should be welcome to constructing engineers, particularly of the younger generations who have come upon the scene of action since the great pioneers performed their immortal tasks.

The leading nations of the world cannot lay claim to exclusiveness in producing men with fertile brains—emergency men. The story is told of building the Shanghai-Nangchow-Ningpo railroad under the direction of a Chinese official as engineer-in-chief. In the course of the work it became necessary to build a bridge across a river. The chief engineer had had no experience in that line, but he was equal to the occasion. He built his bridge on one side of the river and excavated and walled up a new channel under the bridge, diverted the river, filled up the old channel and built his railroad across it.

The book is profusely illustrated, and is of general interest.

Literary Notes

The new French Premier, Louis-Jean Barthou, is, like President Poincaré, a man of letters. History is his field, and his study of the revolutionary orator *Mirabeau* has

been lately issued by Hachette (Paris, 7 francs 50).

Dr. Joseph Collins lays down some simple but excellent rules for overcoming insomnia in his volume entitled *Sleep and the Sleepless* (Sturgis & Walton, $1). In the chapter discussing reading as a soporific, readers will find a new use for *Religio medici*, Plato's *Dialogues*, and William James's *Pragmatism*.

The *Music Lovers' Cyclopedia*, edited by Rupert Hughes, and published by Doubleday, Page & Co., is a compend of just such information about musical terms and musicians as the student of music most often feels the need of. The new one volume edition, brought up to date by the addition of two supplements, is reduced in price to a dollar and a half.

The fact that Lord Nelson was a naval commander seems of less importance to some biographers than the fact that he had a guilty passion for Lady Hamilton. Miss E. Hallam Moorhouse has in *Nelson in England* narrated the relations of the hero of Trafalgar with his wife and with his mistress. An attractive feature is the abundance of illustrations. (Dutton, $3.50.)

Caviare, by Grant Richards (Houghton, $1.30), is an improbable tale of love and high finance, pleasantly told. The improbability consists in the expectation that the reader will believe an idle young Englishman, capable of landing in New York one day and of beating Wall Street at its own game the next, making in three days some $7,000,000 to carry back to Paris and his fiancée. But it is a diverting little tale.

An able brief for the British side of the case is presented in *The Panama Canal Conflict*, by L. Oppenheim, professor of international law at Cambridge, published by the Cambridge University Press (2/6). With his contention in the main we agree, tho not with all his arguments. He carries his search for precedents only to the Clayton-Bulwer treaty. If he had gone a bit further back he would have found the United States had an exclusive right to the route until Great Britain interfered by force.

Grace Denio Litchfield has not been so successful with *The Burning Question* as she might have been. It is a slow moving tale of matrimonial martyrdom. The pursuit of duty brings peace to the principal characters, but not without struggle of soul. There is an amount of question and answer treatment of the problems of divorce, marital duty and kindred subjects which has little resemblance to everyday conversation. (New York: G. P. Putnam's Sons, $1.25.)

Hilaire Belloc's volume of essays, *This and That and the Other* (Dodd, $1.25), is the work of a man comparing himself to one "who should have to deliver at a house a ton of coals, some second-hand books, a warrant, several weather forecasts and a great quantity of dust." None the less the load is a welcome one to all who are acquainted with the dealer. Best of the essays are certain parodies.

H. de Vere Stacpoole, deserting his tropical isles for a time, has written a romance of ancient Athens, the period of which is that year which saw the first production of *The Frogs*. In *The Street of the Flute-player* (Duffield, $1.25) is related the tragic love of the noble Diomed for the daughter of Gyges, the Egyptian moneylender. It is a vivid and glowing story, rich in historical verisimilitude and pulsating with passion.

It would be hard work to get into more compact compass so great a variety of valuable information for the inexperienced gardener as H. H. Thomas, editor of *The Gardener*, has put in the thin volume *Indoor Gardening in Room and Greenhouse* (Cassell). It is freely illustrated, and tells what plants to grow, how to grow them, and how to arrange them on the table. It is worth having.

Everblooming Roses, by Georgia T. Drennan (Duffield, $1.50). There are full-page illustrations of sixteen roses, from the Lord Penzance sweet briars to the Paul Neyron, the largest of all roses. Roses have had many books devoted to them, and this is full of information as to the ever bloomers, including Bengal, Bourbon, tea, remontant, rugosa strains, and the various hybrids, polyanthas and briars, that can be so classed. It is a book for the rose-lover, particularly of the South.

We gave two years ago an account of the discovery by Dr. Schechter, president of the Jewish Theological Seminary in this city, of fragments of a Zadakite, or Sadducean document, which has generally been supposed by the Jewish scholars who have studied it to have been written by a leader of a band of sectarians who emigrated to Damascus not long before the Christian era. An elaborate study of it now appears in the *Jewish Quarterly Review*, by Dr. Adolph Buchler, principal of the Jews' College in London, who argues that it is an archaicizing document of about the eighth century. Dr. Schechter prepared a reply to be published with Dr. Buchler's work, but holds it back until the appearance of some other fragments announced as to appear soon in Paris.

WELL SAID

NOTABLE PARAGRAPHS FROM THE NEW BOOKS

Syndicalism in America

In America, the Syndicalist has received more encouragement. The corrupt state of American politics, the power of the machine, the electoral difficulties presented by a mixt population speaking in many tongues and brought up under very diverse civil conditions, have hampered the growth of a political Labor and Socialist movement, and have encouraged the activities of the Syndicalist Industrial Workers of the World. Moreover, the brutal force which money can exert in America in the workshop, the corrupt force it can exert on the bench and in the capital of every State, make it the most natural thing imaginable for labor to contemplate a resort to such force as it can command—dynamite, sabotage, bad work, the revolutionary strike.—[From *Syndicalism: A Critical Examination,* by J. Ramsay MacDonald; p. 35.]

Why Germany Favors Trusts

Altho ministers have not at all times said the same thing regarding the centralization of industrial capitals, the attitude of the government of the empire and those of the states has been friendly. The indications are rather toward the government-made syndicate than toward legislative checks on the syndicates as now existing. The considerations underlying this position toward these combinations appear to be:

First, the prevailing official political economy, such as Wagner and Schmoller teach, that production on a great scale must inevitably replace individual company production, just as factory production took the place of cottage industry. Therefore, the most efficient and economical unit of production in an industry is likely, in some form, to be coterminous with the nation.

Second, the syndicate, after supplying the internal market, is able, with a relatively small additional cost, to turn out a surplus for the foreign market. The conviction is strong in Germany that the syndicates have been important, sometimes deciding, factors in the export trade.

Third, the syndicates have given life to smaller enterprises that might otherwise have been extinguished by competition without quarter or compromise. The syndicates have systematized and steadied production and distribution, so that alongside the syndicate works grew the independent works until strong enough to be worthy of attention; when they were, they were taken into the circle. The potash syndicate grew from the four mines existing in 1879 to the sixty-five forming the present statutory syndicate. The law provides for the admission of seven other mines that were being opened at the time the act was passed.

Fourth, no strong party seeks to restrain the power and growth of syndicates. . . . By odd chance the Conservatives, the moneyed national Liberals, the so-called free-thinking Radicals and the Socialists hold in wide outline the same convictions regarding the legitimacy of syndicates.

The attitude of all the interests—agriculture, finance, mines, manufactures—is united upon a recognition of the syndicate idea as a necessary principle in production, and both conservative and extreme radical thinking support this view. It is easy, therefore, for the government to be well disposed toward the plexus of monopolies that penetrates every part of German production and distribution. Under such favoring political conditions the unifying of control of the immense fabric of German finance and industry has advanced to its present highly centralized position, so that it has been called "a state within a state." [From *Monarchical Socialism in Germany,* by Elmer Roberts (Scribner), pp. 102, 107.]

Youthful Zeal

Every new generation needs to have some splendid mania or other. Even the most selfish of young people are endowed with a superfluity of life, a capital sum of energy which has been advanced to them and cannot be left idle and unproductive: they are forever seeking to expend it on a course of action, or—more prudently—on a theory. Aviation or revolution, a muscular or intellectual exercise. When a man is young he needs to be under the illusion that he is sharing in some great movement of humanity and is renewing the life of the world. It is a lovely thing when the

senses thrill in answer to every puff of the winds of the universe! Then a man is so free, so light! Not yet is he laden with ballast of a family; he has nothing, risks next to nothing. A man is very generous when he can renounce what is not yet his. Besides, it is so good to love and to hate, and to believe that one is transforming the earth with dreams and shouting! Young people are like watchdogs: they are forever barking and howling at the wind. An act of injustice committed at the other end of the world will send them off their heads.

Dogs barking thru the night. From one farm to another in the heart of the forest they were yelping to one another, never ceasing. The night was stormy. It was not easy to sleep in those days. The wind bore thru the air the echoes of so many acts of injustice! . . . The tale of injustice is unnumbered: in remedying one there is danger of causing others. What is injustice? To one man it means a shameful peace, the fatherland dismembered. To another it signifies war. To another it means the destruction of the past, the banishment of princes: to another, the spoliation of the Church: to yet another the stifling of the future to the peril of liberty. For the people, injustice lies in inequality: for the upper ten, in equality. There are so many different kinds of injustice that each age chooses its own,—the injustice it fights against and the injustice that it countenances. [From *Jean-Christophe's Journey's End,* by Romain Rolland (Holt), p. 173.]

Why Sympathize with the Modernist?

A detached spectator of the follies of mankind could not but be profoundly impressed by the widespread interest which has been aroused thruout the world by the Pope's encyclical against what is called modernism. In many quarters the Papal condemnation is regarded as a sort of Kongo atrocity in the spiritual world. But no reason is given why Protestants and Agnostics, Jews and Infidels, should interfere, even in thought, with the way in which internal discipline is administered in a Church which has always proclaimed its resolution to prescribe with authority and to enforce unquestioning obedience. Why should sympathy be lavished upon persons who are oppressed because they refuse to liberate themselves by leaving an institution which excommunicates them? In these days when no Church is strong enough to persecute effectively, and it has become quite an arguable position that the best way of furthering the spiritual development of mankind would be to break up all ecclesiastical institutions, why should Roman ways of enforcing discipline be denounced with indignation? Why should not those who do not relish them be left to make their choice between submission and departure? They have been surreptitiously trying to combine the advantages of an ancient and highly picturesque community with those of an unrestricted freedom of individual thought; they have been detected and sharply called to order. Why then should they be pitied and paradoxically helped from outside to stay inside by people who would gladly welcome them if they would come out? [From *Humanism,* by F. C. S Schiller. (Macmillan), p. 268.]

Sea Fever

I must go down to the seas again, to the lonely sea and the sky,
And all I ask is a tall ship and a star to steer her by;
And the wheel's kick and the wind's song and the white sail's shaking,
And a gray mist on the sea's face, and a gray dawn breaking.

I must go down to the seas again, for the call of the running tide
Is a wild call and a clear call that may not be denied;
And all I ask is a windy day with the white clouds flying,
And the flung spray and the blown spume, and the sea-gulls crying.

I must go down to the seas again, to the vagrant gypsy life,
To the gull's way and the whale's way where the wind's like a whetted knife;
And all I ask is a merry yarn from a laughing fellow-rover,
And quiet sleep and a sweet dream when the long trick's over.

[From *The Story of a Round-House and Other Poems,* by John Masefield (Macmillan), p. 308.]

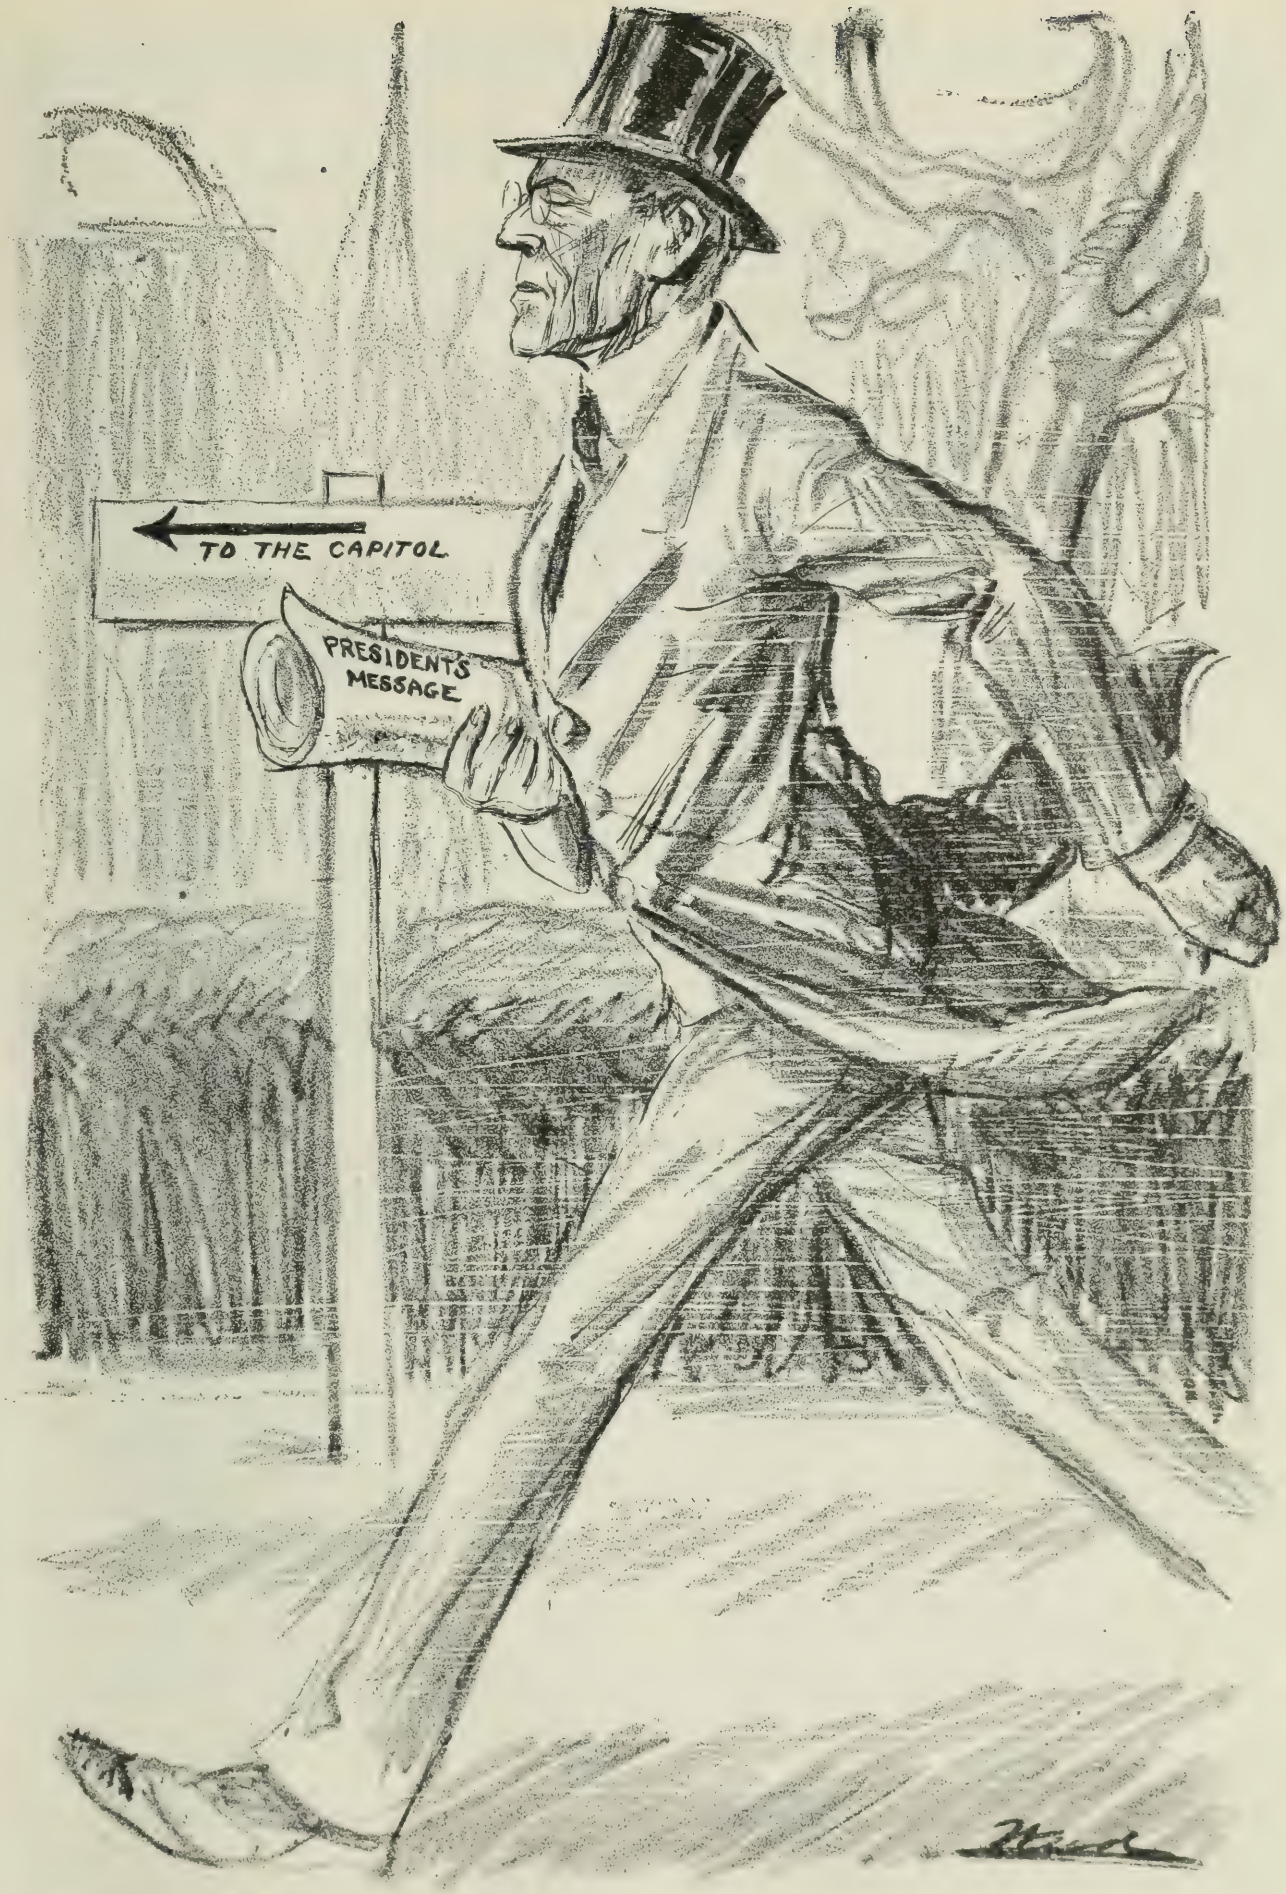
The Idea of God

For each age, God-hungry, turns from the flesh-pots of its Egypt to the best idea of God it can win, and following that idea, so is led thru its own wilderness, follows its own pillar of cloud by day and pillar of fire by night, wrestles with its plagues, beats back its enemies, and spite of all its losses, struggles, struggles onward towards the distant Canaan where it would be. Each age leaves to the future the story of its struggle, the precious symbols of its victories, the battle standards round which its hopes and beliefs rallied and made good their stand.

But old banners that were waved in the victories of long ago may lead us to defeat today. The brazen serpent that was the symbol and guarantee of divine deliverance to one generation may become the accursed idol of the next. It is the duty of Moses to hold it aloft. No less it is the duty of Joshua to grind it to powder. For, ah! the ideals of one generation do often become the idols of the next—poor plaster casts of God, fit only to be broken and thrown away. [From *The Reasonableness of the Religion of Jesus,* by William Stephen Rainsford (Houghton Mifflin Company), p. 71.]

Good Advice to the Minister

I am a strong believer in a very few schemes, but tried to the utmost; I believe in a few mines, but worked for all they are worth. The life of our day tempts us to diffuseness. We are tempted to have too many irons in the fire, and we don't beat any of them to final "shape and use." Gentlemen, have a few well-designed and well-proportioned schemes. Don't lose yourself in dreams. Lay your hands upon a few things, and hold on to them like grim death, and make them pay daily tribute to the Lord your God. Master something. Finish something, or be still working away at it when the Lord promotes you to higher service. [From *The Preacher, His Life and Work,* by Rev. J. H. Jowett, D. D. (Doran), p. 230.]



The Carthaginian Messenger

Every nation must have its own advantages and drawbacks. We are a little too stolid, perhaps, and a little too businesslike, but our stolidity and our businesslike capacity have founded colonies over the whole world and established a magnificent empire. The Romans are a little too fond of glory and give way to sudden emotion in a fashion which seems to us perilously like weakness, but no one can deny that they have established a wonderfully methodical and orderly system of roads all over Italy, and that their capital is still the intellectual center of the world. Talking of that I ought to pay a tribute to the Roman home and to Roman thrift. We hear too much in our country of the Roman amphitheater and all the rest of it. What many Carthaginians do not yet know is that the stay-at-home sober Roman is the backbone of the whole place. [From a parody in the "Merry Rome" column of the *Carthaginian Messenger*—in *This and That and the Other,* by Hilaire Belloc. (Dodd, Mead & Co.)]

A Positivist on Rodin

The watchword of the twentieth century is *Unrest*—Journalism, Politics, Literature and Art ring with one cry, "All change here!" . . . The new craze under which we are now suffering is the Cult of the Foul, or, to put it in Greek, it may be dubbed *Aischrolatreia*—worship or admiration of the Ugly, the Nasty, the Brutal. Poetry, Romance, Drama, Painting, Sculpture, Music, Manners, even Dress, are now recast to suit popular taste by adopting forms which hitherto have been regarded as unpleasing, gross, or actually loathsome. To be refined is to be "goody-goody"; gutter slang is so "actual"; if a ruffian tramp knifes his pal, it is "so strong"; and, if on the stage his ragged paramour bites off a rival's ear, the halfpenny press screams with delight. Painters are warned against anything "pretty," so they dab on bright tints to look like a linoleum pattern, or they go for subjects to a thieves' kitchen. The one aim in life, as in Art, is to shock one's grandmother. And when the society woman dances in bare legs, the up-to-date girl can dress herself like a stable lad. . . .

The radical sophism on which much of Rodin's art is built is that which infects some things of Ibsen, Zola, Gorky, at times even of Tolstoi, and the small fry of the brutalizing Decadence. It is the dogma that that there is nothing in Nature—nothing visible—which is not a fitting subject for art, that when the artist presents in vivid words or form what he has seen, or can see, it is for the world to admire, and no one can complain. The most repulsive, unnatural, unmentionable act or sight, when represented with striking truth, becomes, they say, a work of art, and, according to Rodin, beautiful by its artistic power. This is an absurd sophism. Every hour of every day, in every street, or house, or room, with every man, woman, child, animal, in every hospital, prison, mortuary, or battlefield, are infinite sights which cannot be shown in art. Of all the arts, that of sculpture is the art least tolerant of anything obscene or loathsome. A great poet in a lofty spirit of idealism can typify in verse almost anything. Michael Angelo and Correggio have in painting idealized the myths of Leda and of Ixion, and both experiments have been much condemned. But one may defy Rodin himself to make marble groups which should literally represent —say the last line of Canto XXI of the *Inferno* or line 500 of the fourth book of *Paradise Lost.* [From *Among My Books,* by Frederic Harrison (Macmillan), pp. 325, 335.]

THE MAN WHO PUT THE "DENT" IN *PRECEDENT*

SURVEY of the WORLD

New Vegetable Foods

THE INDEPENDENT has mentioned two or three of the more important new food plants introduced by the Department of Agriculture, especially the dasheen or striped potato, a vegetable that can be boiled or baked or fried, like the Irish potato, and will make a splendid stuffing for chicken or veal; and at the same time has the delicious flavor of newly roasted chestnuts.

The Department is inclined to lay a good deal of stress on one or two very simple things that without revolutionizing garden work are certainly adding immensely to the comforts of the household. A good housekeeper knows the value of that something or other, which in early spring comes under the head of greens. Heretofore we have had nothing better than dandelions and young beets, and in the Southern States sorrel and scoke plants. The petsai comes to us from China as a remarkable addition to this class of plants. It has only one rival and that is another recent importation, from Europe, Swiss chard. Instead of a squatty plant, that one must dig partly out of the dirt, petsai is a tall, long-stemmed plant, its leaves developing stems nearly as large as your wrist. Strip from these the delicately curling leaf formation, and you have a stalk so large and solid that two or three of them will make a dinner for a family. Cooked with a flavoring of Yankee pork, and a few handfuls of bread crumbs, the petsai is as near a rival for the cabbage as the dasheen is for the potato. It is delicious in flavor, and it fails wholly to flavor the whole house, to the offense of the sense of smell.

You can place with this vegetable another, which is sometimes called turnip and sometimes radish, being similar to both. It is the Chinese Sakurajima radish, and yields enormously in ordinary soils. It acts a good deal like turnip, and is as early in its development as the earliest radishes. It is good boiled or fried, or can be eaten raw like a radish. In this case it is sliced very thin and eaten with salt.

Altogether the department has brought to us 30,000 new vegetables and fruits, and is testing these thru selected agents, farmers who can be relied upon, before distributing them for general planting. Mr. Fairchild, who is in charge of this distribution, suggests that our gardens, to date, are supplied only with those plants which were brought in by the first settlers—except for the development of one or two sorts like the tomato. He thinks we are going to see an entirely new sort of garden, containing plants more nutritive, more easily grown, and cheaper for the market. He thinks we are tired of eating the same old things year by year, and are ready for new food. The soil requires a change of crops, at any rate, and we may just as well test some of these new things. It is to be hoped that nothing will be done with the Department of Agriculture to check this importation and testing of new foods.

Our gardens are now both beautiful and valuable, but we can easily improve them if one half is true concerning these new fruits and vegetables. The dasheen, indeed, has already a place on the hotel bills of fare, a place not likely to be vacated now that it has established itself.

E. P. POWELL.

Snake Farming

The snake season is about to open now in Arizona and Texas and northern Mexico, and the prospects are promising for an excellent summer's crop.

Some persons may not know that there are ranches in the great southwestern part of the United States whose sole business is the fattening of rattlesnakes and other reptiles for market. The market for these creatures is an active one, including museum proprietors, circus men, side-show actors, zoological devotees and also chemists who are after the various snake poisons.

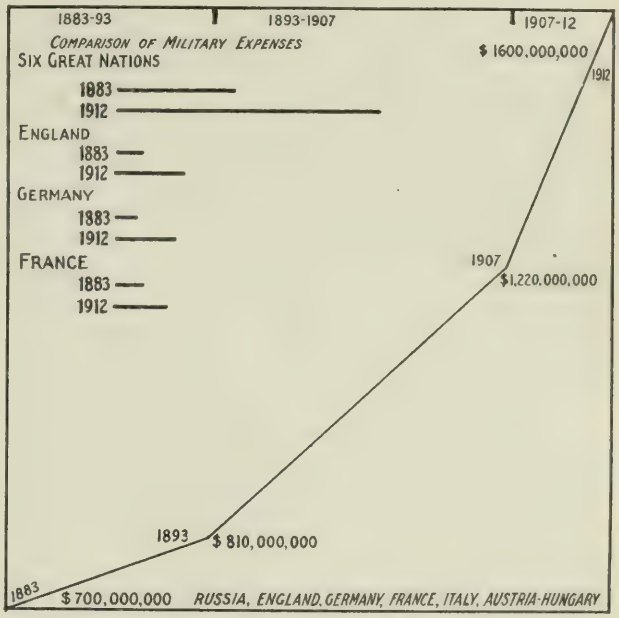
The best known of the snake ranches, the Armstrong ranch, near Brownsville, Texas, consists of ten acres of land surrounded by a high, smooth, board fence, the fence being constructed in a manner to prevent the escape of any wriggling wanderer. In this enclosure are pens for different classes of reptiles, each of the pens holding at least a thousand snakes.

A fat rattler will bring more money than a lean one, for snakes are sold by the pound. Consequently, the snake rancher's

work is to make his charges comfortable and fatten them to the extent of his ability. Then, when the buyer comes along or writes for his shipment, the snake poison is scientifically extracted from the boarders who are about to leave the farm, their poison being kept in bottles for chemists and physicians, and the rattlers go forth to their new home and new experiences as harmless as pet canaries.

It is surprising how intelligent and affectionate these snakes become when their poison has been discharged and their fangs and poison bag extracted. They are as docile as kittens then, and it is a fact that many of the so-called snake charmers in the museum or circus become as devotedly attached to these bright-eyed, gentle creatures as men and women in the ordinary walks of life are fond of their dogs or other household pets.

How the European War Budget Grows



Referring to the new military projects of Germany and France, Edmond Terry, a known French writer on financial topics, cites in *Matin* interesting statistics illustrating the growth of military expenses for the last thirty years. From 1883 to 1893 the increase of military expenses in Germany amounted to $65,000,000, or a yearly average of $6,500,000. From 1893 to 1907 the expenses gradually increased, the growth for fourteen years amounting to $110,000,000, or an annual average of about $8,000,000. For the last five years (1907-12) the expenses still increased by $58,000,000, or an average of $11,600,000 per annum.

In England in the first period of ten years the increase of army and navy expenses was more than $20,000,000, or a yearly average of $2,000,000; in the second period of fourteen years it increased by $140,000,000, or $10,000,000 annually, and in the third period, just as in Germany, the augmentation amounted to $58,000,000, or an average of $11,600,000 per annum.

The growth of military expenditure in France for the above indicated periods was as follows: First period, $20,000,000, as in England, with an average of $2,000,000 annually; second period, $42,000,000, or a yearly average of $3,000,000, and third period, $51,000,000, or an average of $10,000,000 per annum.

The combined military expenses of the six principal European nations (Russia, France, Germany, England, Austria-Hungary and Italy) amounted in 1883 to $700,000,000, while in 1912 they increased to over $1,600,000,000, so that the increase for thirty years equals $900,000,000, or 128 per cent. In the first period the yearly average of increase was about $11,000,000, in the second period $30,000,000, and in the third, $78,000,000.

That the military ardor of Europe is not satisfied yet, witness the projected increase in military expenditure of Germany, the agitation in France for the reëstablishment of three years' service in the army instead

THE GROWTH OF MILITARY EXPENSES IN EUROPE (1883-1912).

of the two years' period introduced in 1905, and the propaganda conducted in England by the National Service League and Lord Roberts for the establishment of compulsory military service, with the project from Cambridge to grant degrees only to the students who include in their curriculum courses in the art of war. The Dance of Death is a-going all over Europe.

The Aleppo Button

The Aleppo Button is a troublesome, disfiguring sore which before long attacks almost every one who stays for any length of time in the East. It is not a boil nor an ulcer. It has no "core" and is not very painful, but it persists usually for a year, and after some months from infection it suppurates. It appears usually on the face, creating a considerable swelling, and leaves a bad scar. It has many names, after the cities where it prevails, such as Baghdad, Delhi, Candahar, Biskra and Bombay Button and other names are given to it in North Africa. It has lately made its appearance in Panama.

What causes it no one yet knows, but almost certainly the infection comes from some small insect, perhaps a sand-fly; it appears only on some exposed portion of the

body. Its microbe is known and is oat-shaped.

Up till lately no cure for it was known, and "grin and bear it" was the only consolation the physician could offer. For a while it appeared that cutting off the actinic rays of light had the best effect in preventing the button from growing very while it appeared that cutting off the suppurative stage. Some of these applications are methyl violet, tincture of iodine, blue or violet ink, and ointment of red oxid of mercury. The x-rays have also been found of some service.

Dr. S. T. Darling, of the Ancon Hospital in the Panama Canal Zone, found the button in the Isthmus, and published a paper about it in the *Journal of Cutaneous Diseases* of December, 1911, in which he mentioned various suggested remedies, only one of which he thought worthy of being called more than a palliative. That was the freezing of the button with ether, as reported by Dr. Morzinowski, of the Crimea.

This suggested to Dr. W. B. Adams, of the medical department of the Syrian Protestant College at Beirût, the possibility of curing it by an application of carbonic dioxid snow. It was applied with a firm pressure for sixty seconds, with a carbonic dioxid snow crayon, all over the button. It produces the intense cold of —148° F., making the button as hard as wood. This kills the microbes and in the course of two weeks the sore heals, leaving a scar much less noticeable than when the button runs its full course. Dr. Adams has tried it on many cases in all stages of development, from small papules of only two or three months' duration to suppurating buttons as large as a dollar. The cure is of the easiest application, and the button is entirely cleared out and disappears. The application of x-rays may cure the button in a dozen sittings; but carbon dioxid snow will cure it, says Dr. Adams, generally with one minute's freezing, in ten days to two weeks, and almost painlessly, cheaply, and with excellent results as far as disfigurement is concerned. For this account we are indebted to the report given in the "Medical Notes" of *Al-Kulliyeh*, the journal of the Syrian Protestant College.

Hardships of the Seal Fishery

Early spring is the harvest-time of the Newfoundland seal fishery among the ice-floes of the Banks and the Gulf of St. Lawrence—one of the most arduous and dangerous of industries. The steamers are stout wooden vessels used for no other purpose, and their crews are fishermen trained from boyhood. The work calls for daring and expertness, and for disregard of misery. Thruout the season the men are packed like sardines in these small vessels, where they can rarely wash or change their clothes; and when the ship is loaded the seal-skins are packed into their quarters, so that they have to lie about the decks day and night, no matter what the weather may be.

The seals sought are of two species—"harps" and "hoods." The former are so called from a mark on their backs like a lyre, and the latter from a cowl-like appendage on the head which they inflate when angry, and upon which blows may be rained without injury. The harps are mild and timid, frequent field-ice, and yield the better oil. The hoods are fierce and wary, prefer rough pack-ice, and are the less valuable of the two. Both kinds go north in summer; and there, in Hudson Bay and Davis Strait, the mothers deposit their young on the ice late in February, each baby garbed in pure white. The floes break loose and start southward, bringing the seal families with them in herds of immense size.

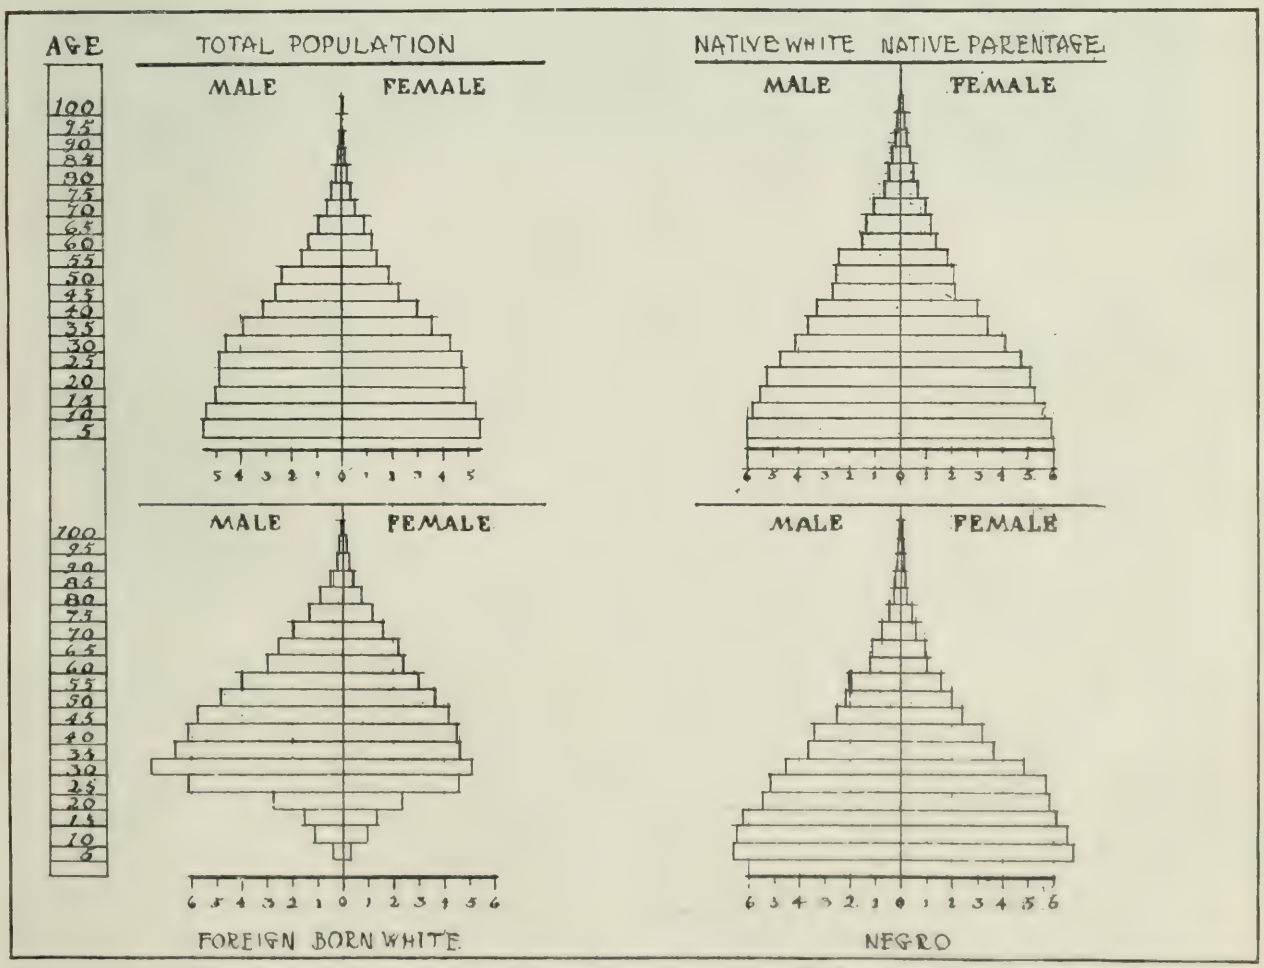
By the second week of March they arrive off the Straits of Belle Isle, and there the sealers meet them. The young seals, which are quite helpless, are killed by a blow from an iron-shod club; adults are rarely killed, for their oil and hides are of comparatively little value. The young victims are at once disemboweled, flayed and the "pelt" (the skin with its adhering fat) is dragged to the ship. About the end of March the young ones take to the water, and after that must be chased in boats along the lanes of open water among the floes, and shot as they swim.

Killing seals is terrible work. The men leave the ship at daylight and travel six or eight miles over the drifting floe. They are supposed to be back by evening with their catch, but sometimes get benighted by losing their way in a fog or a snow-blizzard. Then they suffer intense hardship from frost and hunger, and many a man has thus perished. Falling into the water is a common and fearful accident, for if they escape being drawn beneath the ice they must strip naked and wring out their garments or they will freeze; as it is, the shock often leads to pneumonia or other fatal harm. For all this toil and danger, continued until the close of the legal season, April 30, these men get at best only about $60 as their share of the proceeds of the voyage. The total average catch is about 330,000 pelts annually, worth about $1,000,000.

At St. John's are the refineries where the fat is converted into oil and the skins are cleaned and salted for export, half going to London and half to the United States.

The oil is used in lighthouses, where it is esteemed the best illuminant, and is also used in making soaps, and as a table oil. The skins, by improved processes of tanning, are adapted to a great variety of service as fancy leather, and have largely increased in value during late years.

The Age of Our Population



The diagrams published herewith are designed to show the age classification of the population of the United States, distinguished by sex. The perpendicular line running thru the middle of the figures divides the males from the females, and the figures on the horizontal scale refer to the percentage of the population in each quinquennial age group. Thus, in the upper left hand diagram about five and one-half per cent of the total population are males under the age of five years, while a little less than two per cent of the population are females between the ages of forty-five and fifty. Since those in any age group are the survivors of a much larger number of births, and since death is continually claiming its victims at all ages we should expect the numbers to diminish with advancing age. We find, however, that from twenty to thirty-five years the numbers are almost equal in each age group. This is due to the immigration of adult males and females.

When we turn to the age distribution of the native whites of native parentage we find that there is a gradual decrease in numbers with increasing age. This group is not at all affected by immigration and the result is a more symmetrical figure.

On turning to the chart for foreign-born whites we are confronted with a very peculiar distribution. In the first place, above the fifteenth year there are a great many more males than females. In the second place, the shape of the figure is peculiar in that instead of growing broader toward the base it gradually narrows. The maximum width of the figure is reached between the ages of twenty-five and thirty, which is the age at which most immigrants come to this country. The number of children to enter is extremely small.

The age distribution of negroes shows a population with a large proportion of young and a comparatively small proportion in the advanced ages.

Between the ages of fifteen and sixty-five is the productive life of man. A country with a large proportion at these ages is

DISTRIBUTION OF POPULATION, BY SEX AND RACE, IN AGE-GROUPS

well fitted to do its share of the work of the world. The presence of the foreign-born whites in this country with their peculiar age distribution adds much to the productivity of our population.

Assistant Professor of Political Economy, Yale University.

Forecasting a Volcano

Near the center of the main island of Japan rises Asama-yama, the greatest and most dangerous of Japanese volcanos, which is threatening renewed havoc. Its eruption in 1783 was one of the most violent and extensive on record anywhere, ashes falling over some 425 square miles. Since then it has been quiescent, but recently tremors, minor explosions, and other indications of approaching disaster have been manifested with increasing frequency. After the outburst of 1783, which ejected material calculated as more than a cubic mile in bulk, the pipe of the crater was cleared out to a great depth, but it soon began to refill at the bottom. In 1887 the floor was found by Milne to be 735 feet below the rim of the crater, and in 1911 Professor Omori, director of the Seismological Institute of Tokyo, ascertained it to be only 350 feet below. If this rate of elevation continues the floor will rise to the top of the crater, and then burst, in less than twenty years. These premonitory signals are being watched with scientific care in order to warn the neighboring population in time for an escape. By similar precaution the eruption of the Usu-san volcano in 1910 was attended by no loss of life; while a few months later 1100 lives were sacrificed in a single night to the fury of the Taal volcano in Luzon, because the Philippines government had paid no official attention to equally alarming symptoms.

The detailed study of the eruptions of Asama-yama has led Professor Omori to some interesting knowledge, especially as to the traveling of explosive sounds, tending to explain certain curious facts in that line, as, for example, how the firing of cannon has sometimes been heard at great distances yet not by persons near by; or in one direction when inaudible in another. Thus the minute-guns of the fleet off Spithead, England, fired during the funeral of Queen Victoria, were plainly heard at places 60 to 90 miles inland, altho nearly inaudible at Spithead itself. The sound was so clear at one place 84 miles away that laborers in the field put down their spades and listened; an equally certain record was made at Woodworth, Suffolk, 139 miles distant. Similar anomalies occur in the history of Asama-yama. In the eruption of 1910, for instance, no noise was heard from the very foot of the mountain westward for some 40 miles, but beyond that the thunders were noticeable over a wide area; east of the volcano the noise was heard over a crescentic district of large extent. In 1909 the sound penetrated only a short distance westward yet jarred the houses as well as the peoples' ears in Tokyo, 85 miles southeast, and was loud 170 miles northwest. The direction of local surface-winds has little to do with these curious phenomena, the explanation seeming to be that the sound rises and then is borne away in the direction of the prevailing upper winds. Since the velocity of the wind increases, as a rule, with the hight above the ground, it follows that in the direction from which the wind is coming the sound-rays are bent upward and pass over the heads of observers at a moderate distance from their place of origin. In the opposite direction they are bent downward and so reach the ears of more distant hearers. As, at the last eruption of Asama-yama, the discharge was hurled to a hight of five or six miles, it is not surprising that both the ashes and the sound-waves were carried to a great distance.

The Dolphin Pilot

The visitor to New Zealand is sure to hear about Pelorus Jack. What he will hear will depend upon his appearance and expression. If he looks open-minded and receptive his New Zealand friends will tell him very wonderful things, for example, how Pelorus Jack, a creature of unknown species, has for over thirty years guided ships thru the channel of Cook Straits on their way from Wellington to Nelson; how he holds an official commission from the Government as a pilot; how he uses his tail to wigwag sailing directions to the captain; and how he distinguishes between the British and French flags and refuses his services to vessels bearing the tricolor in place of the Union Jack, evidently not having heard of the *entente cordiale* in spite of his intelligence.

But the skeptical tourist, remembering that the dolphin has from the earliest ages served as a stimulus to the mythopeic tendency, will discount these fish stories to a certain extent and confine himself to the verifiable facts that Pelorus Jack does regularly appear and gambol about the bows of passing ships and that he was made the subject of a special game law, for in 1904 the Governor-in-Council issued a proclamation imposing a penalty of $500 on any one

who should injure him. He is not unique, but belongs to a rare species known as "Risso's dolphin." The Rev. D. C. Bates, who has charge of the weather at Wellington—a big job, for the wind blows hard there—gives the following description of him:

"Pelorus Jack is about fourteen feet in length, has a blunt nose, a humped forehead, a high falcate (scythe-shaped) dorsal fin, and a horizontal tail with two flukes. His color is bluish white, tinged with purple and yellow, and with irregular brown-edged, scratch-like lines in all directions. His flippers are blackish, and mottled with gray. Tho rare, his species is distributed widely in the temperate seas of the world. The food of the species is known, with certainty, to be the cuttlefish, and in the turbulent surges of Cook Straits, approaching the French Pass, or disclosed to him by the movement of the rapid steamer, or even held clinging about its bow in the swirling waters, Jack may find his dinner, and rejoice in the fatness of the dreadful octopus. Members of the cetacean order, to which he belongs, are known to live for two centuries, and, if he has not them already behind him, we may hope that there may still be many years of peaceful life before Pelorus Jack."

Unfortunately, this hope is not likely to be fulfilled, for Pelorus Jack has lately been reported to be weak and ailing, even having to take to the shore to rub off the barnacles or otherwise recuperate. But he is said to have taken a young grampus, already christened "Herbert," as apprentice and is training him to take his place.

PELORUS JACK
A remarkable snapshot by Edgar Warwick of the Dolphin Pilot of New Zealand.

Motor-Chapel St. Peter

The motor-propelled church is the latest and most improved mode of carrying religion into the wilderness. The first "motor chapel" ever built in this country will soon enter into duty for the Catholic Church Extension Society to supplement the service of the railroad chapels.

The car will be used in those sections of the Southwest where the members of churches are too widely scattered to attend a regular church. It will penetrate regions where railroads do not at present enter. Starting from Brownsville, Texas, the chapel will work its way along the Rio Grande River westward thru the state, in charge of two priests.

The car is known as the Motor-Chapel St. Peter. According to the plans announced, it will remain at each stopping place for two weeks, during which time daily worship will be held for all Catholics in the territory. To assist the priests, stereopticon lectures on the doctrines of the Church will be given, the power for the lantern being supplied by the electric light-

ing system of the car. The equipment includes all the essentials for carrying out the rites of the Church in regular form and with appropriate solemnity. There are a folding confessional, a folding organ, a folding rack fitted with large tubular bells for outside use, and a small chime for use at the altar.

The exterior construction readily discloses the nature of the mission for which the car will be employed. The name of the society is lettered in gold the full length of the car. The light cathedral windows, with a cross design in the center of each, and

A CHAPEL TO TOUR TEXAS

the somber gray finish of the car distinguish it from commercial vehicles.

A feature of the body is the folding door construction and the ingeniously installed drop platform, which give, approximately, double the floor space to the car when services are being held. The sides of the car open by means of folding doors, which cover the rear and half of the sides and are adjusted to form the sanctuary walls.

In the center of the platform extensions is set the combination altar and vestment cabinet. Entrance and exit are by an oak stairway, which leads from the ground to the altar. When the altar is not in use it is pushed to the extreme rear and the space in front is given over to living quarters for the priests.

Fifty Years Ago

From **The Independent,** April 23, 1863

FOREIGN

—Mexican news comes down to April 6. A Matamoras paper of that date has accounts, apparently reliable, of a pretty important victory over the French by the Mexicans. It would appear that the French had before shelled and taken part of the other fortifications of Puebla. On March 27, the French columns of attack moved from their parallels against the outer works, were met by the Mexicans, and beaten with an alleged loss of 8000 men and 60 guns. Whether the whole extent of this story is true or not, it seems beyond question that the French have met with a severe repulse.

Pebbles

Daily Cub—"What shall I head this story about the two peroxide blondes who threw a fit at the game Saturday?"

Editor—"Why, you poor boob, just say 'The bleachers went wild.' "—*Minne-Ha-Ha.*

Traveler—Shall I have time to get a drink?

Guard—Yes, sir.

Traveler—Can you give me a guarantee that the train won't start?

Guard—Yes, I'll take one with you!—*London Opinion.*

His arm it slipped around her waist,
Why would it not?
Her head it drooped against his breast,
Why would it not?
His heart it gave a tender sigh,
Why would it not?

Why would it not? —*Siren.*

TURKISH ENGLISH.

The *Missionary Herald* gives the following examples of the struggles of the young Turks at college trying to learn our language:

"Vapor is dried water."

"Oxen, a kind of house animal that gives us milk."

"Steam is a post which the water makes in the weather."

"Hatchet, place for make the hat."

"I and my defunct mother were seated by the fireside."

"Here the tear of indigence is loaded over my thinks as a parasite."

"We heard the baying of the hen, the baying of the cow, the bawling of the hare, and the croaking of the pigs."

"Satin, a kind of water which used to show the weather."

"Scrubbed, to walk without boots."

"Proud, a man who has no wise and do himself big."

"Treacle, a swift food which is made of sugar."

"We were too much glad because we are going to near from after a durable tiresome of toil to enjoy a repose in the arm of our village."

"We have many chances in the college to improve the English language."

THE WEEK

The Tariff Bill in Caucus

After it had been considered by the Democratic House caucus for ten days, and at as many sessions, the Underwood tariff bill was finally approved, on the 19th, and the way was cleared for the House debate. It is expected that this will not consume more than three weeks and that the bill can be sent to the Senate on or about May 20. Some think it will come out of the Senate before July 1, and out of conference two weeks later.

In caucus, Mr. Underwood and those who had assisted him in making the bill were sustained, altho many changes were proposed. Beef is to be free, and there was an unsuccessful attempt to remove the duty on cattle. The vote was 78 to 122. The movement to make the duty on wool 15 per cent came to nothing, the caucus standing for free wool by a vote of 190 to 42. Some criticised the President for taking part in framing the bill. Mr. Underwood said that of 4000 items, Mr. Wilson had made suggestions concerning only two, those relating to wool and sugar. Owing to protests from life insurance companies, some changes in the income tax provisions were made, but the companies did not gain all that was desired. The proceeds of policies paid after death will not be taxed, but the dividends of mutual companies do not escape. Motions to lower the exemption limit to $2400 and $1000 were lost. There was a debate of two hours on the provision reducing by 5 per cent duties on goods imported in American ships. A motion to strike this out was defeated, 60 to 128.

Democrats were encouraged by the result of the election, on the 15th, in the Thirteenth Congressional District of Massachusetts, where Senator Weeks's successor was chosen. The tariff was the sole issue, and the pending bill was attacked by both the Republicans and the Progressives. John J. Mitchell, Democrat, was elected, but not by a majority. The vote was as follows: Democratic, 12,991; Republican, 8843; Progressive, 5678.

A Few Offices Filled

Among the nominations sent to the Senate last week by Mr. Wilson were the following: H. Snowden Marshall, to be District Attorney at New York; William H. Osborne, North Carolina, Commissioner of Internal Revenue; John E. Osborne, Wyoming, Assistant Secretary of State; Henry Clay Breckenridge, Kentucky, Assistant Secretary of War; J. B. Sullivan, Iowa, member of the Board of General Appraisers; William J. Harris, Georgia, Director of the Census. It was reported that Frank L. Polk, a lawyer, formerly chairman of the New York City Civil Service Commission, was to be made Collector of the Port of New York, but the appointment was delayed. To J. M. Lynch, head of the Typographical Union, it was said, the office of Public Printer had been offered. It was reported that the following appointments would soon be made: Charles R. Crane, of Chicago, Ambassador to Russia; George W. Guthrie, of Pennsylvania, Ambassador to Japan; F. C. Penfield, of Philadelphia and New York, Minister to Spain.

The President removed from office Willis L. Moore, Chief of the Weather Bureau. An investigation made by the Department of Justice had shown an improper use of the influence of his position, of his subordinates, and of Government funds, in seeking to promote his own elevation to the Cabinet. Henry L. Janes, whom Mr. Taft made an arbitrator in the dispute between Ecuador and the company which owns the railroad from Guayaquil to Quito, was also removed. It was said that certain diplomatic officers having financial interests in the countries where they serve would be recalled, and that the conventions or treaties negotiated with Honduras and Nicaragua would be laid aside. Two of these relate to loans. The third gives the United States exclusive interocean canal rights in Nicaragua, and also a naval station on the Bay of Fonseca.

The Panama Tolls Controversy

From London there came a report, last week, that remarks made while President Wilson was talking with Ambassador Bryce foreshadowed a favorable termination of the controversy about the exemption of American coastwise shipping from the payment of Panama tolls. One English paper said that the President would soon publish a statement relating to the question. This

was denied at Washington. It was said there, however, that Mr. Wilson had informally told his friends that he believed the Hay-Pauncefote treaty did not permit such exemption, also that he regarded the exemption as in effect a subsidy, and he was opposed to subsidies.

It is understood that Mr. Wilson has been urged to refrain from making his attitude publicly known, or from directing the attention of Congress to the matter, until after the passage of the tariff bill, because discussion of the subject would tend to divide the Democratic party. Senator O'Gorman, chairman of the Senate Committee to which such questions are submitted, is decidedly in favor of the exemption, and a majority of the committee agree with him.

With the approval of the President, the Panama Commission has awarded to a German firm a contract for two huge floating cranes, each to be as high as an eighteen story building, which are to be used in the ship repair yards. The German firm's price, $837,000, was $600,000 less than the price asked by a competing American firm, and the latter required 100 days more for delivery than the time specified by the foreign builders.

Railroad Corruption in Colorado

A report concerning an investigation made in Colorado by Commissioner Harlan has been published by the Interstate Commerce Commission. It relates to passes granted by railroads, and the inquiry, the report says, "developed violations of the law on an extraordinary scale." In one month and on one railroad 7000 trips on free passes were made. Out of thirty-six passengers on a train on a certain date, twenty-one used passes. Says the report:

"The record shows that not only shippers who controlled routing of traffic in any appreciative quantity were favored at all times, but even public officials, careless alike of duty, morals or danger, accepted and even demanded these favors from the carriers. Physicians and surgeons, with and without salary, had annual passes. Attorneys with a nominal relation to a carrier had free transportation. Employees of private car lines traveled without paying for —even their wives and maids had passes. Judges, State officials; members of the Legislature, county and municipal officers, Mayors and aldermen, all joined in the orgy of petty graft, at once sacrificing rightful revenue of the carriers, discriminating against all small shippers and demoralizing public officials, including the Legislature and the bench."

As a result of the investigation the following corporations have been indicted: Colorado Fuel and Iron Company, Victor-American Fuel Company, Colorado Portland Cement Company, United States Portland Cement Company, Great Western Sugar Company, Colorado & Southern Railroad Company, Denver & Rio Grande Railroad Company. The railroad companies have promised to obey the law hereafter. Passes have not been issued by the Burlington road in the last four or five years.

Federal court judges were not among the offenders. Altho railway witnesses frankly said that passes were given to public officials for "political services," the companies' original purpose was to cultivate the good will of shippers and to gain their trade. The report says that passes have been effectively used in getting and controlling shipments.

Huerta's Government in Danger

It was admitted last week at the Mexican capital that the Huerta Government was in a bad way. In the north the capture of Naco, on the Arizona border, left the Federals no town in Sonora except Guaymas, and the rebel attack upon the small garrison there began on the 19th. In the northeast, General Aubert was almost surrounded. Zapata, in the south, had recognized the authority of Governor Carranza, the northern rebel leader, and was safely defying Huerta. There was a fresh and formidable revolt in Guerrero, led by General Salgado.

Huerta sorely needed a loan, but had failed to negotiate one. Exchange and the prices of supplies were rising. The House passed a bill imposing an export tax on gold. The capital press was pessimistic. On the other hand, Francisco Gomez, in Havana, and Emilio Gomez, in El Paso, were pointing to rebel successes and predicting Huerta's downfall. Carranza and Obregon promised to march southward in the near future with 20,000 men. Emilio had refused Huerta's invitation to visit the capital in the President's special car, which awaited him near the boundary. It is said that he remembered the fate of Gonzales and others. The Madero family, it was announced, had decided to assist Carranza.

Ojeda made a brave defense at Naco, but at last was overcome by superior numbers. Half of his 300 men were killed. At the end he retreated across the boundary and surrendered to the American cavalry. A captain and fifteen men sought to cover his flight. All were killed. The final and successful rebel assault was made by Yaqui

Indians. For some time our Government has been feeding about 500 Federal soldiers who have crossed and surrendered. The American commander asks our War Department how long these refugees are to be supported.

In Latin America

The assassination of the Mayor of the Cuban city of Cienfuegos, a Conservative, has been followed by the killing of Jose Fernandez, a prominent Liberal, who was the unsuccessful candidate of his party for the office to which Mayor Mendez was elected. Fernandez was shot in a cafe by one Ordonez, a policeman and a friend of the late Mayor, for whose death he held Fernandez responsible. It is alleged that the slayer of Mendez was hired by Fernandez and other Liberals to do the work. There was much excitement in Cienfuegos, where the stores were closed and the streets patrolled by rural guards. In Havana the Liberals talked of starting a revolution and demanded the resignation of General Monteagudo, commander of the army, asserting that Liberals had suffered by reason of his hostility. Ex-Speaker Ferrara introduced in Congress a bill for the appointment of a committee to make an investigation concerning the death of Fernandez. A prominent officer in Oriente said he knew that Liberal leaders were buying arms in the United States.

With the aid of Governor Asbert, formerly a Liberal, the Conservatives have elected the Speaker of the Cuban House. Great Britain earnestly protests against the proposed concession for a railroad on the north coast, on the ground that such a grant would be unjust to the Cuban Central, a British corporation. Several customs employees have been arrested. It is alleged that by collusion with Spanish importers they have defrauded the Government of $500,000.

In Santo Domingo, Congress has elected Jose Valdez to succeed Archbishop Nouel as Provisional President. No disturbance is reported. Within a year there must be a general election.

Secretary Bryan has begun a study of the controversy with Colombia about the secession of Panama. Colombia declined all propositions made by the Taft Government and insisted upon arbitration. In the Senate, Mr. Hitchcock has introduced a resolution calling upon the State Department for all the correspondence, and especially for the official letters or reports concerning conferences in January or February between Minister Dubois and representatives of Colombia, in Bogota.

England's Insurgent Women

Mrs. Flora Drummond ("General" Drummond) has been summoned to appear in the Bow Street Police Court of London on a charge of inciting to crime, under a law that was enacted in the reign of Edward III.

Militant crimes continue to fill the British newspapers. Thus on the 15th of the month a large house at St. Leonard's-on-Sea, owned by Arthur Philip Du Cros, a Unionist member of Parliament opposed to the extension of the suffrage to women, was burned, the damage being estimated at something under $50,000. On the 21st a great haystack near Corsham, Wiltshire, was fired. Telegraph and telephone wires are cut at intervals, embarrassing the railway service. It is reported that the burning of the London *Standard's* offices was planned, the newspaper being opposed to militancy. Someone attempted to blow up Smeaton Tower on Plymouth Hoe on the 19th. This historic tower formerly stood on Eddystone Reef, but was superseded by a more modern lighthouse in 1882. On the 14th an attempt to blow up a part of the Bank of England was frustrated by a defect in the bomb used. No positive evidence that suffragets were involved in this essay has been produced, however.

The English Home Secretary has ordered the police to prevent public meetings organized by the suffragets being held at Hyde Park, Wimbledon Common and other public spaces in London, recent meetings there having provoked disorder and attacks upon the women by mobs of hoodlums. The police have experienced great difficulty in protecting the women from the hostility of the crowds attracted by these demonstrations, but the women continue to organize such meetings, which no doubt win them some sympathy from a part of the public less brutish than the rowdies. Indeed, these last have in some instances not confined themselves to making things unpleasant for the active suffragets—jeering and jostling women unconnected with the propaganda.

Another "International Incident"

A party of five or six German tourists of both sexes were subjected to jibes in a music hall and at a restaurant in Nancy, France, near the frontier, on the evening of April 12, and followed to the railway station by a jeering crowd. The German Government decided to make the most of this unfortunate incident and instructed its Ambassador at Paris to call for an explana-

tion. At first the bad taste of a few students, somewhat excited by recent events, including the landing of a German Zeppelin balloon at Lunéville after cruising for many miles along the boundary line, was held responsible for the affair, which the French press has minimized as a "pot-house disturbance." Later reports say that low-class loafers were the manifestants. In the excited state of public opinion, however, the incident was embroidered by gossips and by the yellow press, and debated in the German Reichstag. It was also made the subject of an inquiry by the French Ministry of the Interior.

The latter took prompt action in punishing Prefect Bonnet, of the Department of Meurthe et Moselle (in which Nancy is situated) and two other officers by transferring them to obscure posts, and in dismissing the two policemen at the Nancy railway station for failing to prevent persons unknown from knocking off the hat of one German tourist. Action has been taken by the French Government to reduce the danger of further incidents of the kind on the border by forbidding the theaters to produce jingo plays, of which there has been a considerable crop during the last few months. Cable reports say that the disorder at Nancy is, as a political incident, "closed"; but the German week-end trippers mean to sue for the damage done to their wardrobes.

A Military Scandal in Germany

A Socialist member of the Reichstag, Dr. Liebnecht, has revealed the existence of corrupt relations between the Krupp Works at Essen, the richest industrial organization in Germany, and officials of the Imperial War Department. The Socialist deputy declares that the scandal is worse than that of the French Panama Canal Company organized by the late Ferdinand de Lesseps. General von Heeringen, Minister of War, assures the Reichstag that an impartial inquiry is in progress. He regrets the fact that the Socialist member made a part of the truth public before that investigation had been concluded.

The Krupps, who manufacture cannon and armor plate, admit that their Berlin representatives have maintained "friendly relations" with their former "comrades" of the War Office, for the purpose of obtaining "business information," and that presents have been bestowed "on certain minor officials." The Krupps claim, however, to have disapproved of this policy, and to have turned over the facts at their disposal to the highest authorities.

Dr. Liebnecht on the 19th exprest apprehension lest the Government's investigation would result in "hanging the petty thieves and letting the bigger ones go free." He asserted that the Krupps had for years worked by means of bribery and the purchase of military secrets. He denounced this "graft" as treason. He alluded to the fact that in 1868 Friedrich Krupp had not been above corresponding with Napoleon III, and soliciting orders from Germany's enemy across the Rhine. And he stated that certain French newspapers had been provided with "couy" by the German Munitionsfabrik—the matter being calculated to excite the war-fever on both sides of the frontier.

The *Morgenpost* explains how army and navy societies have sprung up in Germany to preach war with the unconcealed financial assistance of the armor plate firms, how files of pensioned officials steadily perambulated thru the country preaching war, how the armor firms subsidized German newspapers to conduct crazy campaigns of hatred against France and England, and how these same firms sold weapons to the German Government at higher prices than to the nations their press were paid to abuse. It concludes:

"The armaments' factories pay 30 per cent dividends, but the German taxpayer is treacherously sold."

In taking upon himself the defense of the Krupps the German Minister of War has assumed a responsibility heavier even than that which he already bore. His forced resignation would surprise no one. The scandal is far-reaching. The Socialist journal, *Vorwärts*, exposed, some time ago, a secret ring among private naval contractors for preventing free competition, and for dividing inflated profits.

The Why and How of German Taxation

Germany's project to increase the strength of her army this year by the expenditure of an additional $25,000,000, bringing up the total cost of the military establishment for 1913 up to a half billion dollars is now said to have been forced upon the Kaiser by the sovereigns of the various German states. The new military plans did not receive the Emperor's approval till the middle of January, and he gets back at the rulers of the states which, collectively, constitute his Empire by accepting their proposals on conditions that they forego the constitutional exemptions from taxation. The fortunes of the various German royalties, taken in conjunction with their civil lists of $100,000 to $500,000 each, form imposing totals.

The argument of the rulers of Bavaria, Saxony, Würtemburg, Hesse, Baden, and the fifteen or sixteen other states of the Empire, is said to have been that the German army has in recent years been neglected in favor of the navy. The naval expenditures have risen from $30,000,000 in 1898 to over $117,000,000 in 1913. The German princes argue, according to reports, that in case a naval war proved unsuccessful the territory of the three states with seacoasts would not be seriously endangered, whereas a defeat on land would place the weaker states in South and Central Germany at the conqueror's mercy.

The Imperial Chancellor warns the Reichstag against the peril of Pan-Slavism, and his case is strengthened by fervid demonstrations in St. Petersburg, and riots in France, to say nothing of little Montenegro's stubbornness. There seems to be no doubt that the German army bill will pass, in spite of the financial difficulties which it presents. The plan to spend over $50,000,000 on fortresses, mainly on the eastern frontier, finds special favor.

Socialist criticism of the bill is decidedly pointed. An additional 136,000 young men will now be withdrawn from productive labor for two years. And with a population a third greater than France, Germany has a national wealth estimated to be five billions less than France's. How the new taxation will affect the individual may be illustrated by the case of a man who has $6000 invested at 4 per cent. With an income of $20 per month he must pay the Government $30 annually. And the new bill, bearing heavily on the constituent states, will result in increased local taxation. Already there are German municipalities where the inhabitants are taxed 10 per cent of their incomes.

Half Belgium's Workers on Strike

Gradual increases during the first week brought the total number of workmen involved in the Belgian general strike close to 400,000—half the male workers—by April 20, and at the beginning of the second week of the demonstration the leaders claimed that nearly half a million men were out. The strike was proclaimed on the 14th by the Socialist Congress to enforce its indirect demand for the substitution of manhood for plural suffrage, the immediate object being the appointment of a Parliamentary commission to study electoral reforms.

Six days resulted in a loss estimated at $12,000,000, two-thirds of which, according to Socialist leaders, was borne by the employers. Industry in the southern provinces was brought to a standstill. The strike became general first in the districts along the Meuse, the coal, iron and glass workers about Liège, Charleroi and Mons going out in large numbers early in the week. In Antwerp, Flanders and West Flanders the Socialists made less headway, but the strike of over 20,000 dockers in Antwerp interfered seriously with shipping. Brussels printers struck, but without embarrassing the newspapers. Many British and French exhibitors decided to withdraw from the Ghent Exposition, scheduled to open April 26, and its success was threatened.

No important violence has been reported, tho incidental acts of sabotage were committed here and there. The Socialists have succeeded in maintaining order as completely as in the general strike of 1893, when they forced the Government to extend the suffrage to all adult males, tho with a plural voting provision. In one case strikers were said to be visiting the museums under the guidance of a professor. Liberal capitalists subscribed to the strike fund, and the Socialists were confident of their ability to hold out for several weeks.

The Cabinet refused to consider any concession, and after stormy attacks by the Left on M. Woeste, the Clerical leader, and M. de Boqueville, the Premier, the Chamber adjourned on the 18th to the 22d, when the compromise measures of Liberal deputies were to be discussed. The Government was handicapped in dealing with the situation by the fact that to hold intact its majority for military reform it was obliged to submit to the exactions of the extreme reactionaries, unalterably opposed to the desired reforms. The Premier exprest himself as willing to have the question referred to the people at the election of 1914, but opposed the appointment of the Parliamentary commission. Compromise was, however, strongly expected at the close of the week, when the strike had clearly become serious. The strikers are confident of success.

The Greatest Steamship

The "Vaterland," of the Hamburg-American Line, is the largest vessel afloat. The ship was launched at Hamburg on April 3, and was named by Prince Rupert of Bavaria. She will be placed in service in about a year. The displacement is 31,000 tons, and will be 50,000 when the ship is completed; length, 950 feet; beam, 100 feet. Like the "Imperator," the latest German monster, she has a double hull. She will carry eighty-four lifeboats, including two motor boats. Her speed will, it is planned, be 22½ knots. The "Vaterland" will ply between Hamburg and New York, carrying 4050 passengers and a crew of 1200.

IN THE INSURANCE WORLD

BY W E. UNDERWOOD

State Life Insurance

Because it is interesting, valuable and from a point of view not enjoyed by the editor of this department, we print the communication following, which is lately at hand from Mr. Harry W. Kimball, field secretary of the Massachusetts Savings Insurance League, an organization which founded and is promoting the interests of what is known in Massachusetts as "savings bank life insurance." Mr. Kimball says:

"I have read with interest your article in the last number of THE INDEPENDENT upon 'Insurance By the State.' One of the arguments which you made against State insurance was that it fails to provide for solicitors and you give as evidence that State insurance cannot succeed the record of the Post Office life insurance of Great Britain and the recent State insurance of Wisconsin.

"It is probably true that State insurance cannot compete with the highly organized system of soliciting of the insurance companies and with the constant personal influence of their agents unless *some substitute* is provided. The agent is everywhere present and it is not to be expected that State insurance can succeed in the face of such effective competition even tho it may afford some advantages over the insurance issued by the ordinary companies. But if the insurance agent was prohibited by law people would still take insurance, especially if in some simple way the advantages which State insurance affords were brought to their attention. Under such conditions any system would rapidly grow.

"Moreover, if the State should provide a force of twenty-five or fifty men whose business it would be to educate the people of the State to the advantages of State insurance I am confident that people would apply for all the insurance that they really needed and the insurance would be obtained at very small expense.

"For example—in Massachusetts the thousands of competing agents would be eliminated with much saving to the people of both time and money.

"Massachusetts Savings Banks Life Insurance, while it is not State insurance, yet is under the management of the State, is entirely a public welfare movement. Its development convinces me that if this movement could be relieved of the competition of the insurance agent and of the constant misrepresentation of agents, especially those of the industrial companies, that in comparatively short time and at small expense the people of Massachusetts could be educated to the advantages of this system so that all the insurance they really needed would be taken thru the insurance departments of the savings banks.

"It is true that any system, however good, will not succeed without effort, especially in the face of intense competition, but if the State were given a free field and some simple plan was adopted to keep the advantages of life insurance before its people State insurance would succeed.

"In regard to your second objection—that State insurance could not be separated from politics, I see no reason why in a State like Massachusetts a State system of life insurance could not be as effectively carried on as is the civil service of the State or as is the State Board of Education. We are gradually eliminating politics from State business and the very fact that so large a proportion of the people would be interested in the efficient management of any State insurance plan would assure its proper administration."

Mr. Kimball goes close to admitting the impracticability—and if impracticable, the failure—of any nonagency system of life insurance which must compete with an organized system of soliciting. He says that State insurance cannot compete unless "some substitute is provided," and the substitute he is working toward is monopoly. It must have the field to itself or perish. This is not an evidence of merit.

It is readily admitted that the State can provide just as good a system of life insurance as can a private corporation, and that it can do it at a lower net cost if the buyers of it will take it without the intervention of middlemen. But exactly the same thing can be said of the private corporation. If the latter could save the expense of agents' services, it would pay that much more in dividends to policyholders, and thus reduce the net cost of the service;

and it must be remembered that the difference between companies today is one of net cost.

The advocates of State insurance, "over-the-counter" insurance and of every other system of life insurance that excludes the solicitor, are contending against a fact in the nature of man—a serious defect, as all admit, but a stubborn, unconquerable fact. Few men will voluntarily have their deaths insured against. In this, even the strongest believers in the necessity for life insurance are infirm—indecisive, vacillating, weak as water. They perform this duty under pressure from without. If, as Mr. Kimball seems to desire, the State had a monopoly of the life insurance business, and no agents to persuade citizens personally to write their names on the dotted lines, State life insurance would yet be and always remain a trifling affair.

The Mutual Life's Great Dividend

During recent years the results achieved by the management of the Mutual Life Insurance Company of New York, as reflected by the figures to be found in its successive financial statements during that period, have attracted the attention of life insurance economists generally, and particularly are they a subject of interest and study to that company's leading competitors.

It is plainly evident on the face of the record that the Mutual Life is not making what is understood in that line of work as an aggressive campaign for new business; and that it is, on the other hand, using every means consistent with the requirements of strict economy to make substantial gains both in membership and insurance in force every year. The figures prove that the company has succeeded admirably in steering this middle course, winning the reasonable fruits of enterprise at a low average cost to its members.

These facts are demonstrated in the figures representing the gain made during a year in the amount of outstanding insurance taken in connection with the savings made in premiums during the same year, which are payable as dividends to policyholders in the course of the succeeding twelve months. As an illustration, we find that the Mutual increased its volume of outstanding insurance in 1912 by $45,913,401, and that it will distribute this year in dividends $17,368,047, which equals 33 per cent of the total premiums received by it in 1912. Calculated on a billion and a half of insurance in force at the end of 1911, a gain of forty-six millions indicates natural, unforced and inexpensive methods in securing new business. A contemporary system of conservation so efficient as to produce a return to policyholders of one-third of their premiums—the heaviest life insurance dividend in this country by any company in a generation—rivets attention. These two achievements require underwriting and financial skill plus conscience of a high order in a management, and, therefore, such results must necessarily become the study of competitors.

All the company's figures representative of last year's operations indicate progress yoked with conservatism. Its total premium income was $56,747,032, a gain of $1,704,033; the total income was $86,446,514, a gain of $1,532,662. At the close of the year the assets were $599,125,046, a gain of $11,994,783, with a surplus of $88,031,411.

During 1912, policyholders received $60,965,489, and in addition the company accumulated for their account $12,072,527, a total of $73,036,016. The total funds received from policyholders in that period was $57,263,659, making the excess paid and accumulated by the company $15,774,357. In this connection it is also interesting to consider the Mutual's record since organization to date—seventy years. The sum of all its receipts from policyholders during that period is $1,471,459,911. It has paid them $1,066,486,155, and it now holds invested for their security and benefit $596,872,780, the total of the two being $1,663,358,935, an excess to and for members of $191,899,024.

To the average man, the maintenance of insurance on his life is a burden—one, as a rule, that is cheerfully and lovingly borne, and these great dividends will be a mighty help to the policyholders who will get them when premium-payment day comes for them this year.

Automobile Insurance

The Connecticut Legislature has amended the charter of the Manufacturers F. & M. Insurance Company of Hartford, lately acquired by Morgan G. Bulkeley, president of the Aetna Life Insurance Company, and his associates, by changing the name to the Automobile Insurance Company, authorizing a capital stock of $2,000,000 and empowering it to furnish complete coverage on automobiles. The company will operate in conjunction with the Aetna Life and the Aetna Accident and Liability. Morgan G. Bulkeley, Samuel G. Dunham, Morgan B. Brainard, J. Sofield Rowe and others connected with the Aetna companies are the incorporators.

FINANCE & TRADE

National Currency Reform

For several hours, on the 15th, the Democratic members of the new Senate Committee on Banking and Currency discussed the question whether a currency bill could be passed at the present session. The prevailing belief was that nothing would be done before adjournment. A day or two later, the committee's chairman, Mr. Owen, of Oklahoma, had a conference with President Wilson, who thinks, it is understood, that something ought to be and can be done. After that conference, the Senator said a currency bill would be prepared and introduced, in the House by Mr. Glass, and in the Senate by himself. It appears that the President, Secretary McAdoo, Senator Owen and Mr. Glass are substantially in accord as to the leading provisions of the proposed bill, altho there will be hearings before the Senate Committee, in May, with especial reference to certain details concerning which there is not complete agreement.

The House, after it sends the tariff bill to the Senate, will be comparatively idle for some time, unless it takes up the currency problem. If it should pass a currency bill and send it to the Senate, there would surely be a long debate in that body, and final enactment might not be reached. In that case, the bill would go over to the regular session, commended by its passage in the House and by its approval in the Senate's committee.

So far as can be learned, the proposed bill will provide for twelve or fifteen districts, each of which shall have a reserve association, while over all of them is to be a supervising board of control. But no provision is made for a central reserve association. In this board of control the districts and the Federal Government are to be represented. The Democrats are bound by their platform to avoid some of the leading provisions of the Monetary Commission's plan. There is danger that partisan hostility to that plan will cause rejection of parts of it which should be used.

While the attention of Congress should not at present be diverted from the tariff by a comprehensive currency reform bill, the passage of the tariff bill in the House should be followed, we think, by consideration of a currency bill. The beginning of the currency debate should not be deferred until January or February next. The whole subject should be taken up, in a bill carefully prepared by the two committees, with the aid of the Treasury Department. Before that is done, there is nothing to be gained by attempting to enact some of the legislative projects suggested by Thomas W. Lawson and afterward adopted by the Pujo Committee. We notice that a member of that committee introduced, last week, a bill to compel incorporation of the New York Stock Exchange by withholding from the Exchange (if not incorporated) the use of the mails and telegraph lines. Such propositions should be laid aside.

Corporation Income Taxes

Returns made to the Commissioner of Internal Revenue indicate that the net earnings in 1912 of the corporations subject to the Federal tax on net incomes was about $3,465,000,000. The total in 1911 was $3,213,707,247. There is shown, therefore, an increase of about $250,000,000, and this is evidence of a fair measure of prosperity. The Commissioner's estimate is that the increase of net earnings was 7¾ per cent.

Tax receipts for 1911 were about $28,500,000. This year the Government will collect from $32,000,000 to $33,000,000, including nearly $2,000,000 of back taxes which investigation has shown to be due. Something less than $1,000,000 of back taxes was included in the payments for 1911.

Financial Notes

The United States supplies 14 per cent of the imports of foreign countries, and takes 9 per cent of their exports.

It is said at Albany that the state will receive between $3,000,000 and $4,000,000 in inheritance taxes from the estate of the late J. Pierpont Morgan.

The New York, New Haven & Hartford Railroad Company has undertaken to supply promptly, at terminal points, to travelers on its lines and to friends awaiting arrivals, information as to the nature and causes of all train delays. Notices on bulletin boards will direct inquirers to places where the information can be obtained.

VOLUME 74 NUMBER 3361

Secretary Bryan's Visit to Sacramento

As we go to press, Secretary Bryan is laboring with the governor and legislators of California, urging and begging them not to enact discriminating legislation against the Japanese. To be sure, the proposed law denying the right to hold land to those not eligible to become citizens of the United States applies equally to Chinese, but our legislators are not concerned at present about the Chinese; they have no strong navy, no formidable war record. So they can be disregarded; not the Japanese who know their strength and have as much pride, or national vanity, as we have.

Secretary Bryan has a hard task before him, and it is not easy to see how he can succeed. He has the better side and the poorer case. As a matter of international courtesy or morals, he is all right, but the laws and the precedents are against him. Governor Johnson has made this perfectly clear in his explanation and defense of California's rights. It is a matter of discrimination, and Congress first made the discrimination against Chinese and Japanese when it enacted the law denying the right of citizenship to yellow people, while granting it to white people and Africans. California is simply proposing to make the same discrimination which the nation makes. To deny Mongolians the right to own land, as California proposes, is a much less offence than to deny them the right of citizenship, as the United States has done. This *Tu quoque* argument Mr. Bryan cannot meet. "You have done the same and worse," Governor Johnson can say, and has said:

"The nation has solemnly decided that certain races, among them the Japanese, are not eligible to citizenship. The line has been drawn, not by California, but by the United States. Discrimination, if it ever occurred, came and went when the nation declared who were and who were not eligible to citizenship. If California follows the line marked out by the Federal Government, the United States and not California should be accused of discrimination."

There is no answer to that. And when Mr. Bryan is shown the text of the laws of the States of Washington and Arizona, which equally forbid those ineligible to citizenship to own land, and no complaint made, he can do nothing but tell the legislators that they had better not, that it would be imprudent, that it would be discourteous, to do what the nation he represents has done, that it is a bad example; and California may stand on her dignity and constitutional rights, and run the risk.

And a very bad example it is which our country has set. We were not so much disturbed in those days about Japanese sensitiveness as we are now. We remember the powerful and solemn protest which Senator Hoar, of Massachusetts, made against that law, but the Senate would not listen. It is a bad harvest that comes from the sowing of the wind. We wish that when Secretary Bryan returns from Sacramento he would secure the introduction into Congress of a law repealing the act which forbids citizenship to Chinese and Japanese. It might not pass, but its discussion would be educative.

Nevertheless, whatever California may

do, it is well that the President has sent the Secretary of State to California. It tells Japan that the nation is friendly, and that the hostility is local. At least it will soothe Japanese resentment.

Armament Scandals

In his presidential address delivered at the Mohonk Arbitration Conference in 1910, Nicholas Murray Butler said: "I am one of those who look for the simplest motives in explanation of action or of conduct. My impression is that somebody makes something by reason of the huge expenditures in preparation for war."

Said an Austrian Socialist to an English apostle of peace, as reported in the London *Times:* "Insert a peace-promoting industry as profitable as the industry of preparation for war, and your peace propaganda will conquer the world."

Not long ago the *Investors' Review* scrutinized the lists of shareholders of three of England's principal armament companies. The following table resulted:

	Vickers Sons and Maxim.	John Brown & Co.	Armstrong, Whitworth & Co.
Duke	2	1	
Marquis	2		
Earl, baron, wife, son or daughter of	50	10	60
Baronet	15	2	15
Knight	5	5	20
M. P.	3	2	8
J. P.	7	9	3
K. C.			5
Military or Naval Officers	21	2	20
Naval Architect or Government Contractor	2		
Financier	3		1
Journalist (including newspaper proprietor	16	3	8

From a private letter to the editor of THE INDEPENDENT by one of the best known admiralty lawyers in New York we make the following quotation:

"All I know about the Argentine Dreadnoughts is that while the matter was being discussed in Buenos Ayres, some interested persons in Argentina offered to go up to Rio and stir up the papers with warlike talk so as to force the Government to let the contracts."

In the New York *Evening Post* of April 13, 1911, the late David J. Foster, chairman of the Foreign Affairs Committee of the House of Representatives, was quoted as saying:

"I am absolutely convinced that there is a criminal conspiracy on foot for the purpose of bringing on a war between the United States and Japan. Thousands upon thousands of dollars are being spent to carry on this propaganda. . . . I am convinced that this constant agitation for a war between the two nations is nothing but a subterfuge employed by those people who are determined that this Government shall build not less than two battleships a year."

And now comes Dr. Liebnecht, the leader of the German Socialist party, charging the Krupps—the richest industrial organization in the Fatherland—with being in a corrupt alliance with officials in the War Department, and the Munitionfabrik with providing certain French papers with "copy" calculated to excite war fever on both sides of the frontier.

Tho Mr. Carnegie says it is inherently improbable that such great concerns would commit the incredible folly of thus laying themselves open to future blackmail, the scandal has shaken Germany from center to circumference.

Unless Herr Liebnecht's charges are disproven, the pacifists all over the world will have been furnished with ammunition of incalculable benefit to their cause when future military appropriation bills come up for discussion in the various national parliaments.

Von Moltke said in the Reichstag years ago:

"War is the father of other wars."

Mr. Morgan's Confession of Faith

We note two interesting views of the opening clause in Mr. Morgan's will which has been much commented on by journals American and foreign. What Mr. Morgan said was this:

I commit my soul into the hands of my Saviour, in full confidence that, having redeemed it and washed it in His most precious blood, He will present it faultless before the throne of my Heavenly Father; and I entreat my children to maintain and defend, at all hazard and at any cost of personal sacrifice, the blessed doctrine of the complete atonement for sin thru the blood of Jesus Christ, once offered, and thru that alone.

Harper's Weekly, not a particularly religious journal, thus comments:

That was the most interesting clause in Mr. Morgan's will, and, more than that, it was the most valuable legacy he bequeathed to the generation of men that is to follow him. It contains the pith of the Christian faith. . . . These words are comprehensive and exact. They declare the basis of the testator's whole character—the basis, moreover, of all the best and noblest and most useful characters that have developed in this world in the last two thousand years.

To have a man of Mr. Morgan's kind and size and prestige declare humbly and in such convincing words his profound confidence in the faith in which he had lived, was a crowning service of inestimable value to mankind.

But *America* thinks differently. It says:

Many are enthusiastic over the opening clause of the late J. P. Morgan's will. The newspapers tell us that it is a beautiful example of pure Christianity. As a matter of fact it is an example of pure Lutheranism, a laying hold by faith of the merits of Christ, without a word to even hint at any sorrow for sin; and the newspapers ought to know that there are three or four hundred million Christians who do not take pure Lutheranism as synonymous with pure Christianity. We should be sorry to die resting our chances of salvation on such a profession; and we hope that in his last moments Mr. Morgan, corresponding to the grace undoubtedly offered to him, supplemented his profession of belief in the Divinity of Christ with an act of perfect supernatural contrition.

But is there not more than "a word to even hint at any sorrow for sin" in the words "*washed* it in His most precious blood," and in "the blessed doctrine of the complete atonement for *sin* thru the blood of Jesus Christ"? That atonement was not for sin unrepented of.

It is true that this is Lutheranism, and it is one statement of Christianity, just as "perfect supernatural contrition" is another statement, and "Be baptized every one of you for the remission of sins" is another, and "The pure in heart shall see God" is another, and "Love the Lord thy God with all thy heart and thy neighbor as thyself" is yet another. It can be exprest in many ways, more or less perfect. That of Mr. Morgan was good for him, and *America's* way is not at all bad. Let the theologians discuss the philosophy of it, and let the rest of us be good, safe, commonplace Christians such as are described in the faith-and-works teaching of the Epistle of James.

Ambassador Bryce

There is no Englishman whom we love more or could be more sorry to lose from our shores than Ambassador Bryce. We are ready to believe that we are a decent country and a decent people because James Bryce says so. If he loves us and thinks enough of us to give prolonged study to our Constitution, our laws and our customs, written and unwritten, we are encouraged to believe, notwithstanding disappointed cynics and critics, that as a people we are not quite unlovely.

Mr. Bryce had previously made his official farewell to the President after six years' residence with us as Ambassador, and on last Friday he bade farewell to our people in a dinner given to him in this city by the Pilgrims of the United States. Mr. Joseph H. Choate, former Ambassador to the Court of St. James, presided, and our next Ambassador, Mr. Walter H. Page, was also present, and both were speakers; but it was Mr. Bryce whom the distinguished company were glad to hear. What he had to say of the United States was helpful and hopeful. Let it be remembered that he understands our institutions better than almost any American, and that he has studied them from a detached and impartial view. He has every hope for our future because we possess more than does any other country a large independent and comfortable class of citizens, owning their own homes, who stand between organized capital and organized labor, an element which "gives a nation strength and stability, and it is an element larger than anywhere else in the world." Another reason for assured hope is that the standard of civic duty among our citizens is steadily rising; that there is a more settled purpose to root out abuses and improve the lot of those who need help.

We are glad he can thus testify, and we believe it is true that we see more evils because we wish to see and remove them. Mr. Bryce's presence has been a great boon to this country and we greatly regret to have him leave us.

"Wishywashington"

Thus is our capital renamed by *The Pall-Mall Gazette,* owned by one who left his country not for his country's hurt, because our Secretary of State does not offer wine at diplomatic dinners.

But why make a fuss about it? Is it such a serious affront not to have wine at dinner? President Wilson did not think so. When invited to the Cabinet, Mr. Bryan told the President that he and his wife did not believe in having alcoholic drinks on their table, and he asked if his declining to give wine to diplomats would offend his chief; and Mr. Wilson told him to do as he thought right. Most of our American people who can afford it do not have wine on their tables, except as a special courtesy to some guest, and at big dinners wine is supplied mainly as a show of prodigal expense.

In nearly half the territory of the United States the sale of intoxicating liquors is forbidden by law. Congress has lately past an act forbidding liquors to be carried over "dry" state lines. The extent of "dry" territory is rapidly increasing. Congress may at any time enact a law forbidding the sale of alcoholic liquors in the District of Columbia—who knows? The United States, which has taken the lead in so many things, may yet be the first nation to put on alcohol as a beverage the ban which the new republic of China has put on opium. Let those who would force opium on China be the ones to complain and sneer when the Secretary of State uses his liberty in giving a dinner without wine. This is no precedent of his; Mrs. Hayes did the same in the White House when her husband was President.

Creative Achievement

If there is any "moral" that has not been drawn from Mr. Morgan's life and will, we can't at this moment think what it is. We shall content ourselves with paying our respects to one "moral" that happens to interest us.

Was Mr. Morgan's tremendous absorption in business, his tireless activity, "caused," or if any one prefers the word, "induced" by the institution of private property?

Philosophers of the William Hurrell Mallock variety have demonstrated to their own satisfaction that Achievement, with a big "A," is a product of activities which superior men put forth for private gain. Cut off the magic lure of profit, leave nothing to work for but the general welfare and "the joy of the working," and nobody, they say, will exert himself to do anything worth while. Civilization and the sale of Mallock literature will come to an untimely end.

We have never been fully persuaded by the Mallockites. Perhaps this is because we have always had a certain fondness for that other school of philosophy which was represented by the darky skeptic who was told by the preacher that his impertinent questions would destroy all the theology in the universe. We can't help wondering how the Mallockites know that if Mr. Morgan had lived in a world that wouldn't let him accumulate $125,000,000 for himself and his family, he would have been an idler, or a "hobo," or a government clerk, or possibly, to give him the benefit of any doubt, a $1500 curate.

So far as we can learn, the Mallockites do not really know this at all. They offer no *a posteriori* evidence. They put forward an *a priori* line of proof which starts from a psychology that, if we are rightly informed, was long ago thrown overboard by the psychologists. Mr. Mallock and all his fellow economists of the capitalized-individualism school naïvely accept the psychology which explains human behavior as determined by a conscious calculation of gain and loss. That psychology had a fairly respectable following in the pre-evolutionary days of Jeremy Bentham and the elder Mill. We shouldn't know where to look for representatives of it now outside of the coterie of the capitalized-individualism economists.

Intellectual processes, including calculations of gain and loss, are nowadays explained as by-products of motor activity, which they react upon and partly—but only partly—control. Will, instinct, habit, are not only the elementary facts of mind; they still play a far larger part in life than conscious calculation does. We act because we must act, because we

can't help acting. We do things because of resistless impulse or tendency to do them, not chiefly because we hold before our minds a conscious image of rewards to be attained.

If this is true of ordinary mortals, it is yet more true of great men. Men like Julius Cæsar, William of Normandy, Napoleon Bonaparte, Alexander Hamilton and J. Pierpont Morgan could no more help doing big and unusual things than they could help breathing. If the society into which they were born had been so constituted that the military men could have done big things only in the realm of peace, they would have done big things in that realm. If the constructive statesman could have done big things only in the realm of business and education, he would have done big things in those realms. If the financier could have done big things only in the world of morals and religion, in that world he would have been a leader.

We won't be dogmatic. We won't say offhand that the Mallockites are wrong and the psychologists right. We suspect, however, that such is the truth. We think it extremely probable that if Mr. John Pierpont Morgan had been born in a socialistic age and as a citizen of a socialistic community, he would have been remembered as an indefatigable worker, distinguished for sound judgment and splendid achievement in promoting the general happiness of mankind.

Mr. Bryan's Peace Plan

Last week Mr. Bryan presented to the members of the Diplomatic Corps at Washington for transmission to their governments the initial plan of the new Administration for world peace. He proposes that treaties be negotiated with all nations whereby commissions of inquiry shall be established to investigate those disputes which cannot be settled by diplomacy, and to make a report of their findings. Not until a stated period after the reports have been published shall the nations be free to act independently.

Mr. Bryan says moreover that the United States is ready to agree to cease adding to its armament while the commission is engaged in its labors.

This idea of a commission of inquiry is not a new one of Mr. Bryan's. At the meeting of the Interparliamentary Union in London, in the summer of 1906, he introduced a resolution for such a commission, and in THE INDEPENDENT of August 30, of that year, he defended it at length:

> It solves the most difficult problem in regard to war and peace, because it handles those questions which thus far have defied arbitration—questions supposed to affect the vital interest or the honor of the Powers concerned, and which they are unwilling, therefor, to remove from the arena of violent settlement to the precincts of any court. . . . If an investigation into the facts of every case can be had, prior to the commencement of hostilities, the chances are 100 to 1 that you can find a settlement of both the question of fact and the question of honor without resorting to war. For with nations, as with individuals *disputed* questions of fact cause most of the controversies. Clearly bring out the actual facts and the controversy disappears, as a rule.

The two Hague Conferences provided suggestions and rules for avoiding war under four main heads. These were:

1. Good Offices and Mediation.
2. International Commissions of Inquiry.
3. Voluntary and Obligatory Arbitration.
4. International Courts.

The commission of inquiry, as perfected by the Second Hague Conference and now on the international statute book, is purely voluntary in character. In Article 9 its powers are defined as follows (we quote in full—italics ours):

> "In disputes of an international nature *involving neither honor nor vital interests*, and arising from a difference of opinion on points of fact, the contracting powers *deem it expedient and desirable* that the parties who have not been able to come to an agreement by means of diplomacy should *as far as circumstances allow* institute an international commission of inquiry to facilitate a solution of these disputes by elucidating the facts by means of an impartial and conscientious investigation."

It will thus be seen that Mr. Bryan proposes a commission of inquiry which is obligatory and all comprehensive in character and is therefore far in advance of that already in existence, created at The Hague, tho the latter has already been brought into use in one notable instance, perhaps averting a war—we refer to the North Sea or Dogger Bank affair between England and Russia. Mr. Bryan's

proposal would absolutely insure that the commission of inquiry should act, even if one of the parties to the dispute were opposed. His plan, therefore, is to be highly commended as a step in the right direction, and we see no reason why it should not be cordially received by all enlightened nations.

Mr. Bryan's proposition, however, for the cessation of armament building pending the report of the commission of inquiry raises almost insuperable difficulties. Such a proposal might be agreeable to a nation if consideration were given only to the threatened adversary, but many of the nations are conducting a military program to meet exigencies that may grow out of controversies with more than one nation. In other words, disarmament is not a question that two nations can settle independently, but a world problem involving all.

Mr. Bryan's proposal, however, is the first official intimation, as far as we are aware, ever made by an American Government that it is ready to take steps toward the limitation of armaments. As such it assumes a remarkable significance.

In our issue of April 3 we asked our State Department to join with Winston Churchill in his offer to the world that England would cease building battleships for a year if the other nations would do the same. Mr. Bryan's proposal shows that our Government is now willing to take up this problem in earnest.

Mr. Bryan, therefore, has made a notable beginning to hasten that longed-for day when, as Victor Hugo prophesied, the only battlefield will be the market opening to commerce and the mind to new ideas. Let him hold to the faith. Where there's a will there's a way.

A Desirable Postal Facility

Among the new measures which in the near future will be brought before the Post Office Department there is one which can hardly fail of immediate and favorable action. The new Postmaster-General and his Third Assistant, Governor A. M. Dockery, to whose immediate jurisdiction it will fall, are both men of signal business ability, and have assumed their responsibilities in the Post Office Department as business men, not as politicians. The measure will receive their hearty approval and coöperation because it is a clean business proposition; a facility which will not only prove of great value to large business interests all over the country, but will yield the department from the start an increased revenue of at least $20,000,000 a year.

At the present time thousands of business concerns rely largely upon circulars as a means of advertising, inclosing with the circulars an envelope, addrest to themselves, for reply. In many other ways, also, by business houses and individuals, the return envelope is utilized.

We all appreciate the fact that when such an addrest envelope is received by us without a stamp there is a feeling of resentment against whatever the circular or letter may suggest. We feel that we are being asked to contribute two cents for the privilege of replying. But unless we have studied the matter, or suffered, we do not realize that even when stamped envelopes are inclosed, the sender does not receive back, on an average, more than ten in a hundred. As a matter of careful investigation, those who send stamped return envelopes report that they stand to lose 90 per cent of the stamps.

Notwithstanding such discouraging conditions, more than 100,000,000 return envelopes and postal cards are annually sent thru the mails in this country, and the number will be largely increased in the development of the parcel post. Careful inquiry has been made all over the country as to the result upon this method if stamped envelopes could always be inclosed, with protection against loss if they should not be returned, and the consensus of opinion sets the increase at over ten times the present number, which would yield an increased revenue to the Post Office of $20,000,000 a year, without considering the new business which would be created by the facility, and the effect of the parcels post upon the circular method of soliciting business. This on the outgoing mail alone.

For a year or more Post Office officials have been working upon the proposition and have at last devised a plan. The

facility can be accomplished as stated above, without necessitating any change in the department rules and regulations, or the necessity of increasing the present force—unless increased business should demand it—while fully complying with every Federal postal law; so that the facility is at last in a fair way to be realized at no distant day.

The plan proposed is something like this: the concern wishing to make use of stamped return envelopes makes a deposit with the Postmaster-General of a sum sufficient to cover first-class postage on the number of envelopes desired—say, for example, $100, representing the purchase of 5000 two-cent stamps. For this deposit he receives a permit to purchase from the department 5000 stamped envelopes at the usual price of such envelopes *less* the price of the stamps. These envelopes will bear a peculiar stamp—one easily recognized in sorting letters—and the line, "This stamp is void if the address is changed." He prints his own address on these envelopes and encloses them wherever an answer is desired.

The receiver has simply to put in his reply and mail the envelope. At the sending office the stamp is canceled like any other stamp. But at the office of destination these envelopes are not delivered with other mail. They are treated as envelopes are treated bearing the mark "Two cents due." They are set one side and the addressee notified to call for them.

When he calls he pays the regular first class postage on all such letters as he receives. It is not really paying the postage on those letters, but paying the amount which would otherwise be taken from his deposit; saving the department the time and trouble and bookkeeping necessary to keep track of each lot of mail received.

After sufficient time has elapsed since the last envelope was sent out to make it reasonably probable that all have either come back and been redeemed or else have been thrown away, the purchaser will receive back from the Post Office his original deposit in full, or a fresh permit to purchase more envelopes. The deposit can stand as long as he wishes to continue using the stamped return envelopes and will finally revert to him intact. It simply complies with the law that first class postage must be prepaid, and secures the department against any possible contingency in which such letters failed to be redeemed, in which case the amount would be taken from the deposit.

Thus, while the Post Office Department is fully secured from any possible loss, the hundred million and more return envelopes annually sent out can be sent ready stamped for mailing, while the senders are secured and protected from loss by the fact that the stamps are void if the address is changed. The sender only pays the postage upon such return envelopes as come back to him, and the Government receives full payment for all service which it renders.

The facility must be open to all on equal terms, for no other course would be possible or justifiable. There cannot be special privileges granted. Only for the protection of the department against the annoyance and complications of small business, a limit will be set—say $500—as the minimum deposit which can be made.

It will be very easy for smaller consumers to club together or make some friendly arrangement with large consumers. These are details simply suggesting that while the department can be protected from the burden of small business, no one will be deprived of the facility. It will be of material advantage to business interests all over the country as well as to the Post Office Department, and now that a satisfactory plan has at last been devised, the sooner it is put in operation the better.

Cardinal Gibbons

Richard Sheil, having read our editorial on the three American Cardinals, sends us a word of appreciation of Cardinal Gibbons. We learn from him that when a parish priest in Canton, then a suburb of Baltimore, Cardinal Gibbons was, with the exception of Vicar-General Coskery, the only priest in the diocese of Baltimore who was a Union man during the Civil War. It is a curious fact that Cardinal Gibbons has never voted. No one has known his politics, but from the fact that he was a Union man, and the

fact that he has declined to vote, while the majority of his people have been Democrats, it has been surmised that his sympathies are with the Republicans, as have been confessedly those of his friend, Archbishop Ireland.

Like Archbishop Ireland, again, all his instincts are thoroly American, and he has not in him a particle of the snob. Nor is he a lover of money. Vicar-General Coskery at his death left to him personally a fortune reported to be $80,000, but he did not keep it, nor has he amassed anything from the cathedraticum and other assessments that are his due as Archbishop. Some years ago he distributed all his wealth among the institutions of his diocese in an impartial way, remembering those for the blacks as well as for the whites, reserving for himself nothing but a five per cent income, and this he has given away generously. He lives in no palace, but as plainly as any priest. "He coude in litel thing han suffisaunce."

The Capture of Scutari

The brave little Montenegrin state, that fights like a mad wildcat, and dares the mighty lions and bears among the nations, has won its prize. Can it keep it? That is the question which now troubles Europe.

The sympathy of everybody in America, and the sympathy of all Europe, except Austria and the Powers tied to Austria, goes with Montenegro. It is a small state, at most a hundred miles long and eighty wide, with a total population about that of Newark, N. J., or Milwaukee. But its men are all soldiers, all in the army from eighteen to fifty-two, and when the present war broke out every Montenegrin emigrant returned, because he would be ashamed not to, that he might fight the Turk. There are none left in the United States to rejoice in the fall of Scutari. They are on the ground, or under it.

The astounding fact in the story of the fall of Scutari is the dare-devil desperation with which this pigmy state faced the combined power of Europe. They told her that they had settled the status of Albania, that Scutari should belong to Albania and that Montenegro should not take it or have it, and that she must raise the siege. Montenegro refused. Then the great Powers sent a fleet to blockade the Montenegrin coast, thinking that she was merely bluffing, and would yield to major force. But she did not yield. She kept on battering the fortress. Then they said they would send an army to force her to stop. She did not mind that, but hurled her hardy soldiers against the defenses, bayonet to bayonet, and captured Scutari, and received the capitulation of Essaat Pasha, while the six amazed weakling Powers are left, some angry, some pretending anger, and all puzzled as to how they can save their face and save the situation.

All depends on Austria. Austria is fighting mad. It was to please Austria that all the Powers agreed to create Albania a semi-independent little nation with a million semi-barbarous inhabitants. It was to please Austria that they forbade Montenegro to capture Scutari and thought to enforce it with a blockade. It was all because Austria, having by violence taken Bosnia and Herzegovina, wished to prevent any strengthening of the Slav states to the south of her.

Montenegro will not give up Scutari unless an irresistible army is sent by Austria, under the mandate of the Powers, to drive her out. It was for Scutari that she has been fighting all this time—Scutari and independence. Great Britain would not drive her out, nor France, nor Russia. But Austria wishes it, and Germany stands strong behind her, and Italy is held fast in the Dreibund with the two, altho her Queen is daughter of the Montenegrin King. It is the defiance, the insult of Montenegro which disturbs the six nations. If this baby state can defy the Powers of Europe, who will hereafter mind what they say or do? Did not Russia submit when bidden to retire from the gates of Constantinople, and shall little Montenegro have her way? We presume she will yield because she will have to, but she and Servia, her close ally, ought to be allowed the outlet at this coast they so much need. Servia has none, and a thin Austrian strip shuts in Montenegro except for a few miles of bare coast devoid of a harbor.

The Beef Supply

To those who do not understand why the price of beef has been rising and is so high we commend an examination of certain official reports published in Washington. One shows how our exports of beef and cattle have declined. The figures are as follows, relating to the nine months ending with March and to corresponding parts of preceding years:

Nine months.	Beef, lbs.	Cattle.
1913	5,479,439	13,598
1912	13,681,744	94,361
1911	31,115,735	90,261
1910	61,958,208	128,431
1909	99,635,798	157,834
1908	169,201,898	287,216
1907	200,069,729	307,726

In the same years (periods of eight months) our imports of cattle have grown from about 12,500 to 222,000.

Another table shows how the number of beef cattle in the United States has been declining, while our population has been increasing:

	Beef cattle.	Population.
1913	36,030,000	97,028,497
1912	37,260,000	95,410,503
1911	39,679,000	93,792,509
1910	47,279,000	92,174,515
1909	49,379,000	90,556,521
1908	50,073,000	88,938,527
1907	51,565,731	87,320,530

While our population has increased by 11 per cent, the number of beef cattle has decreased by 30 per cent.

Protective tariff duties have not induced our farmers and ranchmen to keep pace with the demands of the domestic consumer. They should not complain if these duties are now removed.

A Railroad Investigation

We said some weeks ago that President Mellen, of the New York, New Haven & Hartford Railroad Company, ought to resign. A very interesting inquiry concerning the company's finances and its acquisition of trolley and steamship lines has since been made by the Interstate Commerce Commission. The testifying witness was one of the commission's expert accountants.

We shall not examine now the evidence which indicates, until it is controverted by something more than mere denials, that company officials profited largely by the acquisition or transfer of properties; that the company lost $400,000 a year when it turned over its sleeping car and parlor car service to the Pullman Company; and that it paid $1,319,756 for a steamship company which was being operated at a loss, this sum largely exceeding the valuation made by the steamship company's own officers. We shall make only brief reference to the fact that extremely high and apparently unwarranted prices were paid for the controlling stock of several urban and suburban trolley lines; that the cost of a short new line running out of New York was $33,000,000, or about $1,500,000 a mile, and that the acquired Boston & Maine, while earning little or nothing, has been distributing dividends of 5 or 4 per cent out of a surviving surplus and paying a million or two for property in which one of its directors was interested.

But we direct attention to the fate of two steamboats, because it indicates the quality of Mr. Mellen's management of this great railroad property. They were the "Rhode Island" and the "Connecticut." The first was built in 1882, at a cost of $727,000, and the cost of the second, in 1889, was $672,000. They were acquired by one of the railroad company's subsidiary steamship corporations and, in 1906, were turned over to another subsidiary at a valuation of $650,000. Two years later they were transferred back to the first of these subsidiaries, and in this transaction were valued at $932,000. The increase has not been explained.

Less than three years later, these steamships, valued on the books at $932,000, were sent to the scrap heap. They were broken up, and the sum realized was only $44,000. To the remains of the "Rhode Island" $9000 of this sum is credited; the other boat's material yielded only $8500, but $26,500 was added for the engines, which were saved for use in another vessel. The manager of the subsidiary company said, in a letter, that the price of either of the steamboats, if sold, must be $150,000, "but Mr. Mellen," he added, "has notified me that he thinks they should be broken up." He also said in this letter: "We do not want them to fall into the hands of

anybody who would use them in competition with ourselves."

In the recent management of this railroad company there have been waste of capital and extravagance, if nothing worse. For this waste and extravagance the general public has paid, and there may be a share to be paid by the stockholders. The market price of the stock fell last week to its lowest record. The dividend has been 8 per cent, and last week's low price was only 109½.

We are still of the opinion that President Mellen should resign, and it seems to us that there are directors who should go with him.

The Belgian Strike

The Belgian strike is unique. There is nothing like it in history. We commend the consideration of it to our American labor unions, and to the British suffragets.

It was not a strike of laboring men for wages, nor for shorter hours, nor for any amelioration of the conditions of labor. It was solely for a political end, for the reform of the suffrage laws, for an equal manhood vote. And this strike was peculiar in that there was in it no violence, no sabotage. The leaders were very careful to impress on their men that it must be an absolutely peaceful, silent strike, and they obeyed. This made it all the more impressive. It did not seem like a strike of passion, but of grim determination. And it won on this line. The government saw five hundred thousand men demanding equal manhood suffrage. They do not have it now. In 1910 there were 1,440,000 voters in Belgium, but a million more votes, because the rich people can cast each two or three votes. Suffrage is thus, like silk, weighted in favor of the rich. But when the one-vote men refused to work the Cabinet yielded and promised to introduce a bill to correct the inequality.

There are lessons in this strike. The first is the efficiency of the method of peace. Violence does not help; it hinders. It sets the greater public against the strikers. A just cause does not need violence. Violence and sabotage outrage the moral sense and injure the cause. This one peaceful strike gained speedy success. Particularly we commend the example of the Belgian workmen to the British suffragets. Their method is as pronounced a failure as is the success of that in Belgium, both being for a political cause.

This strike may encourage workmen in other countries to strike for other reforms than those of labor. Of all causes that of peace is first. Should a war be proposed between Germany and France the workmen, to which the soldier class mainly belongs, may strike by way of protest, and such a strike would be likely to be effective. We hardly dare to conceive of a strike of women for suffrage, for that would be a hunger strike indeed, but of a laborers' strike for any one of the forty or fifty reforms set forth in the Socialist and Progressive platforms; or of Southern laborers against Jim Crow laws, a reform which the platforms forgot to include. There is history, perhaps dynamite, in the Belgian strike.

The Chicago Morals Court

Failure of the ordinary police court to deal successfully with the large and ever-increasing number of cases of violations of the city ordinances pertaining to public morality has resulted in Chicago in the establishment of a Morals Court as an experiment in the problem of improving civic government, which we commend to the attention of other cities.

The Morals Court, organized as a branch of the municipal court service of that city, has for its purpose not only the facilitation of routine business but also an inquiry into the relations of cause and effect in crime. Police court magistrates thruout the city have been notified to transfer to the Morals Court all cases of an ethical character. It is the hope of Municipal Chief Justice Olson, whose idea the Morals Court is, that this will not only dispose of a great mass of the cases that are choking the business of the courts, but will also bring these special cases to the care of men and women who will use a broader experience and wider humanitarian views in their judgments than would the ordinary judge of the police courts.

For this purpose he has placed in charge of the court Judge Jacob H. Hopkins, whose long service in the courts is his qualification. For his aids he has

chosen Mrs. Louise Tousey, chief adult probation officer of Cook County, and Dr. Anna Dwyer, one of the most prominent women physicians of Chicago. Dr. Dwyer's work will be the immediate care of the women brought before the court whenever their physical condition seems to require her services. Her appointment has proclaimed the intention of the court officers to seek a determination of how vital a factor physical ill health may be in the aggravation of criminal tendencies.

Class Education

We have in hand the report of the State Regents in charge of the schools of West Virginia, and we note that they think that negroes are so inferior intellectually to white people that they should have an inferior kind of education. Note this fine passage:

> The white man taught the Indian to use intoxicants. Those intoxicants are harmful to the white man, but proved much more harmful to the Indian. The same mistake was made when the white man gave the negro the white man's idea of higher education. While the white man could carry this classical education soberly, and find use for it in his unlimited opportunities for applying it, the negro became unsteady with his imaginary sudden elevation and found himself in possession of something which made him feel rich, but did not increase his ability to buy a home or provide bread and butter for his family.

The kind of education which the Regents of West Virginia propose to give their colored citizens discriminates and is meant to discriminate against them, shutting them up to manual labor.

In Brief

By the provisions of the anti-trust law the attempt to suppress competition and secure monopoly is forbidden and punished. An amendment to the civil sundry bill declares that no appropriation made by the bill to enforce the anti-trust act shall be used to prosecute combinations of labor to prevent competition. President Taft vetoed such a bill, declaring it to be "class legislation of the most vicious sort." Can it be anything less? Can it be re-enacted and signed by the President?

Senator Vardaman believes in protecting negroes from being killed by white men, and white men from being contaminated by having negroes sit near them. When Governor of Mississippi he rode into a mob of a thousand men and saved a negro from being lynched, who was later proved innocent; and in Washington he will introduce into Congress a Jim Crow law, and a bill looking to repeal the amendments giving negroes the right to vote and hold office.

The *Churchman* thinks that great publicity is given to conversions from Protestant to the Catholic Church, while conversions in the other direction are made so quietly that nothing is heard of them. It says:

"Within the last four years seven Paulist fathers in New York City, members of the great teaching society of the Church of Rome, all high-class men, left that body, and one of them became a priest in our Church, but the incidents were not given head lines in the daily press."

The number has risen since we mentioned the withdrawal of four Paulist fathers. At a late religious meeting in this city we observed four ex-priests present, all excellent and scholarly men, three of them formerly Paulists.

The news that the Provisional President of the Republic of China and his Cabinet have signed the Five Power loan of $125,000,000 is a ground for serious alarm. The largest body in the Parliament has opposed it and even declares it illegal. What is more Dr. Sun is reported as saying that the act may split the Republic. We are glad that the United States is well out of it.

The Gainesville, Ga., women appeal strongly to the President not to remove Mrs. Longstreet, widow of a brave Confederate soldier, from her position as postmistress. We cannot believe he will remove her for a political reason. But Robert Small, an old soldier with an unusual record, has been removed in South Carolina, because he was a Republican negro.

Dr. Friedmann's visit to this land of tuberculosis and gold has slumped to a money level. A big company is to finance the thing all over the country to the benefit of the German physician. This may not be quite level with medical ethics, but it may match salvarsan, otherwise called 606, and the patented medicines.

Emperor William of Germany believes in duels, at least in the army, but there must not be too many. He warns officers to practise self-restraint as a manly virtue. The duello should be extirpated, not reduced. It is a relic of barbarism.

The Most Useful Americans

A Referendum of Independent Readers on the Most Deserving of Their Contemporaries

In our issue of January 30, 1913, we put the following question to our readers:

WHO ARE THE MOST USEFUL AMERICANS?

If life insurance could really insure against loss of life on whose lives should the American people best afford to pay the highest premiums? In other words, who among our contemporaries are of most value to the community, Whose places would be most difficult to fill? If Congress should decide to award ten prizes to the most deserving men and women in the country and leave the choice to a popular referendum, who should get the largest number of votes?

Tho we offered no prize for the correct answer to our conundrum, because we did not know it ourselves, the inquiry aroused a great deal of interest. It was put to classes in modern history and current events in several colleges and high schools; it was made a subject for debate in reading circles and clubs; it was discust by ministers and editors.

When the returns came in we found that we had over ten thousand names to count and that 343 different persons had been considered worthy of the honor of being included in the list of the ten most valuable citizens of the United States. The ten who led are the following:

THOMAS A. EDISON	898
JANE ADDAMS	611
ANDREW CARNEGIE	604
THEODORE ROOSEVELT	514
HELEN GOULD SHEPARD	474
ALEXIS CARREL	470
GEORGE W. GOETHALS	461
WILLIAM J. BRYAN	458
WOODROW WILSON	427
LUTHER BURBANK	398

Altogether these names received over fifty per cent of the votes, but since the number ten is purely arbitrary it is proper to name also those who stand next in order receiving over a hundred votes each: Booker T. Washington, 326; Harvey W. Wiley, 310; Orville Wright, 221; William H. Taft, 162; the Mayo brothers, 143; Ben B. Lindsey, 122; Charles W. Eliot, 119; John H. Patterson, 101.

The value of such an inquiry lies in what it tells, not of the persons named, but of those who vote for them. The greatest service to humanity may be done by some man or woman quite unknown to fame so far as this generation is concerned, and we cannot even rely upon the future historian to discover who it is. But all those whose names appear in the list have done something which their contemporaries recognize as worthy of honor; it is interesting to see what forms of social service are most generally recognized and most esteemed. Three fields of human activity are almost equally represented in the list: politics, 3; philanthropy, 3; applied science, 4. These then might be called the three avenues leading most directly to contemporary fame.

Passing now from the question of why they deserved celebrity to the question of how it was attained we see at once that the most potent factor is the periodical press, which has made their achievements and personality known to their contemporaries thruout the country. These are the names which have most frequently been made the subject of special articles in the popular magazines. It has, in fact, become one of the most useful functions of modern American journalism to discover the exceptional man wherever he may be and to explain what he is doing for the world. This extends his influence over the whole country and accelerates progress thru the rapid spread of new ideas and the impulse of a good example, as well as securing to him in his lifetime a due meed of public appreciation. The promptness of such popular recognition is shown by the presence in the above list of the name of Alexis Carrel, whose medical discoveries were comparatively unknown to the layman until last December, a month before the vote, when he was awarded the Nobel Prize, becoming in consequence the focus of the limelight.

The presence in the list of the names of two women is noteworthy, especially

since they do not owe that position to their sex. They were chosen not because it was thought necessary to have some women represented, but because as individuals they had performed public services whose value no one can deny. Nor can any one say that in thus taking part in public affairs either has sacrificed feminine charm and modesty.

One cannot fail to be struck by the absence of some classes of public men that might be expected in such a list. Thus pure science, philosophy, religion, literature and art receive no recognition. Not a minister, general, admiral, poet, novelist, dramatist, actor, musician, artist, architect or business man received enough votes to bring him anywhere near the topmost ten. Colonel Goethals is of course a military man, but it is obviously not his army record but his engineering work at Panama that brings him into prominence. Mr. Wilson and Mr. Roosevelt are historians, but if they had not stopped writing history and gone to making it they would not have stood so high in public estimation. Mr. Carnegie and Miss Addams have written books which have sold largely, but it not merely as authors that they are thought worthy of honor.

It is sometimes argued that Mr. Carnegie did more for his country in developing the steel industry than in endowing libraries; the latter however is evidently better appreciated than the former. So, too, it is as an inventor, not as a manufacturer, that Mr. Edison is placed at the head of the list. We may question if in any other country or in the United States in any previous generation the omissions mentioned above would have occurred. It is all the more striking because many of those who sent in lists obviously took pains to include representatives of various professions. Some of our correspondents frankly say, "I would like to pick a preacher for the remaining place, but I know of none of sufficient ability and prominence," or "There ought to be an author in the list, but I don't know who."

We are not obliged to resort to guesswork as to what led our readers to choose these names. They have in most cases told us. This affords a valuable index of the public mind, for it shows clearly what characteristics and accomplishments appeal most strongly to the people. We quote from the letters varied specimens of the reasons given why they thought the persons selected were worthy of the honor. Taken together they read like an English version of the Latin speech made by the dean of a university when he presents to the president the candidates for honorary degrees. But in this case the public tribute, based as it is upon a wider suffrage than that of an academic council, has a higher value than that of many an LL. D. *causa honoris.*

THOMAS A. EDISON. The name of this great inventor appeared on 87 per cent of the lists sent in. Some of the reasons given for the selection are the following:

Who has added more to the material elements of civilization, by his own inventions and by what they have suggested to others, than any other one man in the history of the world.

Giving more comforts in a material way to civilization than any other American.

Whose pioneer work and inventiveness furnish comfort and entertainment to millions.

Because he has demonstrated that inventive genius may be turned to a nobler and better purpose than the mere making of money.

Perhaps the one name which no one could possibly omit from such a list. An incomparable combination of extraordinary diligence and inventive ingenuity. A personal repudiation of the "good-old-times" doctrine.

Occupying probably the first place among strictly utilitarian men. Without his aid few of our modern enterprises could be carried on as effectively as they are. His invention of the phonograph has been one of the largest factors in the education of the world.

Manipulator and exploiter of natural forces for the good of man.

Leader in the development and application of inventions that have revolutionized civilization in the last century.

There is no one like him. He is the one-man-to-the-century inventor. Millions of people all over the world are his debtors, for nearly all of his inventions have a commercial value. He is an indispensable asset of our nation.

The world would surely be a dull place, if it had not been for his genius.

Dynamic mind that provides the world with heat, light, comfort, amusement, and whose further miracles are as yet undreamed of.

Whose multitudinous inventions have

brought and are bringing comfort and ease and new fields of activity to the civilized world.

His marvelous discoveries are revolutionizing domestic science, business, travel.

JANE ADDAMS:

Best interpreter of practical sociology.

Social reformer, sane and efficient.

Leader in work of social amelioration. Most conspicuous American woman now engaged in public or semi-public activity.

Highest type of womanhood, unselfishly devoted to the uplifting of the unfortunate.

Of all that feminism represents as a force for world betterment she is the physical incorporation.

As the most prominent settlement worker and an important writer on social ethics.

Not only for her personal help, but because her life has been an example and incentive to many.

Because she has revealed a human method of helping God's poor.

For her educational and philanthropic work in Hull House.

Whose work laid the foundation for and stimulated the development of all social service work in this country.

Whose work at Hull House is the articulate expression of a heart of love and of courage equal to the demand upon it.

Who stands most conspicuously as representing the high ideals of the sensible, warm-hearted womanhood of America. Known everywhere as a social service worker and looked up to everywhere as a leader for her sex.

Rousing the new conscience, and, without the vote, directing men's attention to an ancient evil that, after all, they will have to cope with and overcome.

Inasmuch as the Christianity of our day seems to have been unable to find a means of reaching the social outcasts, the would-be helpers preferring to deal with the subject at long range, and since the Mary Magdalenes present our gravest social problem, Miss Jane Addams, who has pulled off her gloves and attacked the question in a practical way as no one else seemed to be willing to do, and who is getting results, must be included in the list.

High on the list, first as America's greatest personal impulse to social service, and second because, while others have interpreted the life and conditions of the poor, she has interpreted the mind and the fundamental ethical and spiritual positions of the poor. I know of no one comparable to her in this line except Tolstoi, and he sees only one side.

ANDREW CARNEGIE:

A common-sense millionaire and philanthropist.

Representative of the masterful "self-made men," the boast of America, whose illimitable wealth and munificent generosity foster peace.

Pre-eminent in the world of philanthropy, wherein, by precept and example, he has been able to successfully apply large sums in a reciprocal way which required the recipients to contribute money or effort.

Has been and is most useful in spreading means for education and self-help and the spirit of economic personal independence; the first by his libraries and the latter by his literary works.

For his example in using great wealth for the public good in promoting science, education and peace.

On account of his many philanthropies, chiefly the founding of libraries, and the promotion of international peace.

For placing the means of education within the reach of all.

For 1. His philanthropies; which I would rank as follows: (1) Libraries; (2) education; (3) research; (4) heroes; (5) peace. 2. His work as financier.

Advocacy of peace and interest in education, particularly his gift of libraries to small cities.

For his wonderful gifts for libraries and scientific research.

For his benefactions, business organization and writings.

Because of the wisdom and breadth of vision displayed in his public benefactions. That some of these have been managed in a spirit utterly foreign to his original ideas in the matter, after it had passed out of his control, in no wise detracts from his claims to a place in the list.

Whose work for the world's peace, whose philanthropies and whose personal character represent a splendid force forward.

Because he has promulgated the principle that a man of excessive wealth should consider himself a trustee of such wealth rather than the absolute owner thereof, and also because he is the foremost American advocate of peace and disarmament.

A multi-millionaire, who loves books and his fellowmen more than gold. No other person living has made accessible so much good reading to so many people. A man who voluntarily transmutes his vast wealth into a healthful educational influence for the benefit of his fellows, should be regarded as one of our most useful citizens.

THEODORE ROOSEVELT:

An "all-round" great man, whose services to the nation have been of great value in many ways.

Patriot, statesman, working for better government, working to help the masses to better their condition.

Teacher of civic righteousness and constructive politician, destined to be a statesman.

Pre-eminent in the realm of national affairs; by an ability to achieve results, and for being able to secure efficient service in government affairs, even when handicapped by routine methods—as instanced by aiding Dewey to secure supplies, the lack of which

would have left the fleet unfitted for action at Manila.

Because of his quick, usually accurate perceptions of right and wrong, and his power as an electrifying agent upon the sluggish mass of American citizenship.

Believed by many to personify the spirit of American democracy in its manly, agressive form. A man of unusually accurate impulses, a strong force for righteousness and an unquestioned leader of an earnest following.

A man who started a crusade for clean and righteous living in and out of office that shook the country from center to circumference.

America's most useful citizen, "the most tonic force in American life," and as fully the embodiment of his age and the political prophet of the future as Jefferson, Webster and Lincoln. I feel this strongly, tho myself a life-long Democrat; tho I do not think politics and statecraft necessarily the sphere of largest service; tho I think he has materially lowered the standards of American gentlemanliness.

His main service has been the clothing in new language of the civic and other virtues, giving, as it were, new incitements toward the old, familiar and always revered ideals.

Because he has taught the need of pure politics, pure business methods, pure living; because he is a true humanitarian.

Because of his great activity in whatever he takes up and because of the fact nearly all that he has done, and is now doing, is good in the interest of the masses. Altho he is greatly criticised, in my opinion he is now our greatest American citizen.

Who, if not the cause, was and is the exponent of a much needed *moral* awakening.

He has such a hold on the public that he can sway it more powerfully than any other man now living. He has generally done this for the welfare of the majority.

For starting the Panama Canal, settling the Russo-Japanese war and making an effort in behalf of conservation of natural resources.

Theodore Roosevelt performed a great public service, when he disrupted the Republican party. He is deserving of praise even if he was unconscious that he was doing a good deed, as that party has been a thorn in the flesh of progress for a decade.

Statesman who was instrumental in awakening the public conscience not only to the need of civic righteousness but to the possibility of securing it in much greater measure. Originator of the "new nationalism" propaganda which he is working to see enacted plank by plank into federal laws irrespective of the party which may foster this or that plank.

Who more than any other has contributed to a quickened national conscience, and whose robust integrity is paving the way for a cleaner, healthier public life.

In spite of all his faults, for his work in curbing the tyranny of the judiciary.

Who stopped the war between Russia and Japan, started the Panama Canal, began the investigation of the trusts.

Because of unusually large achievements while President, and because much may still be expected of one with his equipment. He has also been useful lately in reminding the country that no one man is *It*.

Entirely aside from his mistakes and his recent display of very human qualities, Theodore Roosevelt, in the realm of practical government, stands alone and preeminent; and after passion shall have subsided and he and we sleep with our fathers, impartial history will, without reserve, name him one of the "Ten."

HELEN GOULD SHEPARD:

A notable example of a truly gentle and charitable womanhood.

Because of her philanthropies in the direction of personal service, Y. M. C. A. for laboring men, etc.

As an inspiring example of unselfishness for young women of the rich and favored class.

She has consecrated her millions to the benefit of mankind and she has endeared herself to the nation.

She has kept a level head and done a world of good despite influences to the contrary.

Exercising her traditional woman's vocation of bringing joy and comfort to those that need her most, the lame, the halt, the disinherited of this world.

Wealthy but without ostentation. Gives freely of her wealth and time to the betterment of others less fortunate.

Because in her philanthropic work she has shown a genuine personal interest in the objects of her philanthropy and has proved that people of wealth may find a higher happiness in such activities than in social amusements and selfish indulgence.

Whose life has shone out as a beacon light in exemplification of Christ's teaching —"I was hungry and you fed me, naked and you clothed me, sick and you ministered unto me."

Helen Gould—we prefer to call her so yet —plain Helen Gould—not for any single great work of hers, but for the much good she has done; perhaps most of all for her living example, for helping to create a better and higher concept of life and its duty in a section of society which, favored beyond measure, has been altogether too exclusive, too self-centered and too indifferent to the common good.

For her example to the rich in the use of wealth, for her love of and aid to the poor, for the splendid example which her whole life has been to women everywhere, Miss Helen Miller Gould (with apologies to Mr. Shepard) is a most useful citizen. No "new woman," except where "newness" means real social progress, no fossilized

edition of the woman of yesterday, except where clinging to old-time ideals means a non-surrender of the qualities which make woman sweet and fine, Miss Gould may be pointed to as the *model woman.*

ALEXIS CARREL:

As a type of the scientist who discovers how to make life happier by making it healthier.

Splendid mental equipment, coupled with ceaseless devotion to science, without ulterior motive of fame or material gain.

Representative of progress in surgery.

Alleviation of human suffering and prolongation of human life.

Whose keenness in research has advanced medical science immeasurably.

The fact that he has been able to keep heart tissue alive for 120 days, apart from the body to which it belonged, is indicative of the grand work he is doing for posterity.

On account of the progress he appears to be making toward proving that life may be kept going in a body without regard to the Biblical stricture upon its duration.

GEORGE W. GOETHALS:

The hero of the Panama Canal romance, eminent as an engineer and broad-minded executive, faithful to his employer, the national government, fortunate in his opportunity to lead in the accomplishment of a national undertaking, previously impossible.

Pre-eminent in the sphere of public work; by demonstrating the capability for efficient service that army officers can give when needed for handling works of national importance.

Great executive as well as engineering skill.

Whose record at Panama has given us encouragement in believing that we have men in public service who can do things and do them honestly.

Enduring fame as builder of the Panama Canal, a credit to the army and to the nation.

A living proof that Uncle Sam can produce some good men who promptly and efficiently accomplish a world-famous undertaking.

WILLIAM JENNINGS BRYAN:

The prophet of political advancement, the man most fruitful in political theories already consummated, as well as the greatest among the powers of opposition to the besetting sin of conservatism.

Probably no man in America has done more, and is now doing more, to stimulate morality and temperance and high ideals in life.

For unceasing defense of the rights of the masses against the vested interests.

Road-breaker and placed in a position to make his personality felt during the next few years.

Because he is the most persistent and consistent leader in the movement for progressivism.

Because of his advocacy of peace, of the rights of the people, and because he has been bigger than party, bigger than his ambitions.

A long-time leader of a great political party, without yielding to political corruption.

Pre-eminent in the realm of politics; by dignified and persistent advocacy of minority interests, and by a firm stand for high principles in political service.

His name is put above any other statesman, because a man that subjected himself to ridicule and the charge of a bolter of his party ticket in order to exalt and defend the temperance cause has something to his credit that no other statesman of his rank has.

As a force for civic righteousness in a party carrying such a mass of crude citizenship he deserves an honor and support commensurate with his influence.

Of service as an example to Americans of unselfish adherence to one's political ideals. He and Helen Keller are stirring examples of persistence and success under adverse circumstances; he in governmental ideas affecting the many, she in personal education developing her own intellect and character against a stupendously heavy handicap.

His public life has been an inspiration to all men whose ideals rise above personal profit and for whom unsullied honor and strict integrity in public service stand as a guide to action.

WOODROW WILSON:

A student with a broad view of general conditions, with a splendid understanding of the American situation, and I believe desiring honestly to do all that he can to better the condition of Americans generally.

Because his death now would put Thomas Marshall into the Presidency, which would be a serious calamity.

Progressive, constructive statesman with a supreme opportunity.

Not merely because he has been elected to the Presidency, but because he is a type of the very best kind of man in public life today—fearless in the expression of his opinions, a scholar and the father of a family of splendid American girls.

Taking higher grounds in politics than the politicians of today, emphasizing Jefferson's policy or doctrine of faith in the masses.

The scholar and gentleman in politics, a rare figure in contemporary America, a man who gives promise of becoming a political philosopher of first rank, and a plain man without pretense. May his tribe increase, for such are sorely needed in twentieth century America!

For the determination that he has shown in asserting true democratic principles in government.

Because he is willing to be the people's executive.

A happy union of scholar and statesman; a sound thinker and a lucid expositor of democracy. He takes his high office, blessed with thoro training and an excellent record.

Because Bryan made him and he will now make Bryan.

Not because he happened to be elected President, but because of his efforts in behalf of clean politics and the example he has furnished, that a gentleman and a scholar may at the same time be a practical politician.

Whose services to higher education are second only to those of Charles W. Eliot and William Rainey Harper; whose preaching of high political ideals is second only to Roosevelt's and Bryan's, and whose contribution to the proper understanding of important phases of American history is noteworthy.

Gentleman and scholar, an experiment in politics—here's to his success in making good the confidence reposed in him.

An example of one with a scientific training for statesmanship. Has the opportunity if properly used to rank as one of our great Presidents. His actions and successes so far indicate he will fulfill these expectations. In a position to become the great leader not of the Democratic party, but of the common, everyday run of people.

Not chiefly because of what he has done as writer, college president and governor, tho this is much, but I believe he has the opportunity to remove the lingering traces of Civil War sectionalism and unite North and South in a fully national spirit, and I think he will do it.

LUTHER BURBANK:

In many ways the most unique person now living. Applying his time and talents to the discovery and adaptation of the beautiful in nature. Then giving these to the world.

Success in propagating the best in flowers, vegetable and fruit industries and utilizing the desert.

Nature's confidante and chum.

For his achievements in plant eugenics.

As originator of new fruits and flowers.

Luther Burbank of California and Niels E. Hansen of South Dakota, each in his line doing a wonderful work for better living conditions both on and off the farm.

Besides the ten who received the highest number of votes, it is interesting to consider other names on the 1030 lists sent us which received a considerable number of votes.

It was somewhat surprising to find no college or university president or professor in the list of the elect, for we may take it for granted that Mr. Carnegie was not nominated primarily because he had been Lord Rector of St. Andrew's University, or Mr. Wilson because he had been professor and president of Princeton. Highest in the class of educators comes Dr. Booker T. Washington, but of those who include his name in their lists not so many mention his development of a system of vocational training at Tuskegee Institute as his services to his race as a whole, as the following phrases show: "The inspiration of 10,000,000"; "the evangel of peace in the South"; "doing for the South what Jane Addams is doing for the the slums"; "the Moses of the negro race, leading them up from slavery thru the desert and into the promised land"; "race pacificator and educational opportunist"; "solving the second hardest question we have to deal with in America"; "because of his efforts for the promotion of a better understanding between the races." Among university presidents, Charles W. Eliot, president emeritus of Harvard, received the most votes, being described as "America's foremost citizen, with a long life of usefulness behind him as educator and thinker, and with a busy present in which he is exerting a salutary influence on public affairs"; "an iconoclast in education, an optimistic, wholesome and merciful critic of our national deficiencies"; "venerable but virile, radiating a rich personality into thousands of American homes." Other university presidents whose names appear most frequently in the lists are David Starr Jordan, of Stanford; Nicholas Murray Butler, of Columbia; Richard Van Hise, of Wisconsin, and Henry C. King, of Oberlin.

Among medical men the Mayo brothers stand highest, being nominated as one person, since their work is inseparable. Their reputation comes not only from their skill as surgeons, but from the organization they have effected at Rochester, Minn., in which a thoro preliminary examination often obviates the necessity of an operation. Colonel Gorgas appears on many lists for his sanitation of Panama, and Dr. Simon Flexner and Dr. Jacques Loeb, of the Rockefeller Institute, for their experimental researches in physiology.

It is, as we have said, applied science,

not pure science, that wins popular applause. Dr. Harvey W. Wiley, formerly chemist of the United States Department of Agriculture, has a strong hold upon the affections of the people because of energetic propaganda in favor of pure food. Honor is given to Orville Wright, of Dayton, as one of the inventors of the aeroplane, and to Prof. Liberty H. Bailey, of Cornell, for the education of the public in agriculture.

In the field of politics, besides Roosevelt, Bryan and Wilson, the name of ex-President William H. Taft is most prominent, chiefly on account of his efforts to secure international arbitration. Next comes Senator Elihu Root, "the ablest statesman of his time" and "a defender of national honor in the fulfilment of treaty obligations." Senator La Follette also receives many votes as "a road breaker in politics," "the best and strongest man in the Senate," and for his "increasing defense of the rights of the people against the vested interests."

Among other public men Judge Lindsey stands high "for the founding of the juvenile court, thereby reducing the crop of criminals." Then follow Jacob Riis, as "a pioneer in the struggle for better homes and surroundings for the poor"; Gifford Pinchot, for "his consistent and determined efforts to conserve, in the interests of the people, the natural resources of the country and to promote their development in an efficient way"; and Louis Brandeis "as a type of the lawyer who devotes his knowledge of legal technicality to public good instead of the aggrandizement of private monopoly." John H. Patterson, of Dayton, president of the National Cash Register Company, and now under sentence of imprisonment by the United States court for "combination in restraint of trade," receives 101 votes as one of the most useful citizens of the country. And this was before the flood, too. Among the labor leaders named, John Mitchell stands highest, followed, a long distance behind, by Eugene V. Debs. Others receiving a sufficient number of votes to entitle them to honorable mention are William J. Burns, "the terror of the criminal world"; Miss Helen Keller, as "an inspiration to handicapped lives" and because of "her perseverance in trying to overcome an almost insurmountable barrier"; and Miss Ida M. Tarbell, "exposer of social and financial rottenness."

The vote showed that the most popular of our millionaires, next to Mr. Carnegie and Mrs. Shepard, is J. J. Hill, railroad promoter and builder, because of his enterprise in developing the great Northwest and making homes for multitudes of Americans. John D. Rockefeller, Sr., receives almost as many ballots for various reasons, such as the founding of the University of Chicago and of the Institute of Medical Research, "for the eradication of the hookworm disease"; "not for his colleges and medical research laboratories primarily, but because he put more and better light into millions of homes, even the humblest," and because he has become "the most useful citizen of the century by the practical dedication of his whole fortune thru the national incorporation of the Rockefeller Foundation, having for its objects 'to promote the well being and to advance the civilization of the United States and its territories and possessions and of foreign lands, in the acquisition of knowledge, in the prevention and relief of suffering, and in the promotion of any and all the elements of human progress'!" The late J. P. Morgan is commended by many as "our greatest financier"; for his "promotion of the industrial development of the country"; for "the prevention of panics," and for "bringing the art treasures of the Old World to the American people." The letters also indicate a widespread admiration for John D. Rockefeller, Jr., as the leader of the movement for the promotion of social hygiene and the suppression of the white slave traffic.

As we have said, ministers do not appear on many of the lists. The highest number of votes received by any one is 57 for the Rev. Francis E. Clark, the founder of the Society of Christian Endeavor. Next comes the Rev. Lyman Abbott, editor of the *Outlook*, "who by his books, his editorials and his sermons, especially in university circles, has done more to liberalize popular theology and to make religion real and possible to lay doubters than any other man." He is followed in the order of popularity by the

Rev. William A. Sunday, commonly known as "Billy Sunday, the baseball evangelist," because, as one correspondent puts it, "despite the crudeness of his theology and the unconventionality of his address, he is still doing probably more than any other man to awaken men to the importance of practical religion and right living." Other votes for ministers and religious leaders are rather widely scattered among many names, the most frequent being John R. Mott, the international Y. M. C. A. secretary and leader in the missionary movement; the Rev. Frank W. Gunsaulus, pastor of the Central Church, Chicago, and president of the Armour Institute; the Rev. William Hayes Ward, editor of THE INDEPENDENT; the Rev. Washington Gladden, of Columbus; the Rev. Walter Rauschenbusch, author of *Christianity and the Social Crisis;* the Rev. Anna Shaw, president of the National American Woman's Suffrage Association; the Rev. Charles M. Sheldon, of Topeka, author of *In His Steps;* Mrs. Maude Ballington Booth, of the Salvation Army, leader in prison reform; Fanny Crosby, writer of hymns; Archbishop Ireland, of St. Paul.

The army and navy are not so well represented as the Church. General Leonard Wood, Admiral George Dewey and Commodore Robert E. Peary are the only names that received any considerable number of votes.

Literature, judging by this referendum, is even less highly esteemed. The most prominent names are the Rev. Henry Van Dyke, James Whitcomb Riley, William Dean Howells and Hamilton W. Mabie. Evidently our popular writers of novels, romances and short stories, tho never so numerous and so highly paid as now, are not generally regarded as useful or indispensable members of society. Music, drama and fine arts are represented only by scattering votes.

The letters accompanying the lists were interesting reading, and we regret that we have not space to publish them. Some contained thoughtful discussions as to the relative value of different forms of social service, or of natural ability, or lofty motives, or accidental opportunity. Some offer highly original or amusing suggestions. One correspondent arranged his ten in the form of a directorate, a revival of the classical *Decemviri,* and suggested that under such an all-star government as this we would all live happily ever after: Executive Head, Theodore Roosevelt; Chairman Ways and Means, John D. Rockefeller; Commissioner of Education, Charles W. Eliot; Secretary of Peace, David Starr Jordan; Chief Engineer, George W. Goethals; Technical Expert, Thomas A. Edison; Department of Social Ethics, Jane Addams; Department of Humanitarianism, Helen Gould Shepard; Bureau of Publicity, W. J. Bryan.

Several of our readers volunteered a second list giving the names of "the ten most harmful citizens of the United States," whose removal would, for reasons specified, be a benefit to the country. These we did not ask for and we forbear to publish, but we may mention the curious fact that some of the names were the same as those others included upon their lists of the ten most useful citizens. Some lists were of a decidedly partisan character, for instance, composed entirely of Socialists, of suffragists, of prohibitionists, or of Roman Catholic prelates. One enthusiastic lady from Pennsylvania wrote the name of "Theodore Roosevelt" ten times, apparently under the impression that the cumulative ballot system was already in operation. Several nominated their mothers, showing thereby a commendable spirit of filial affection, but perhaps also an exaggerated idea of the importance to the country of their own existence.

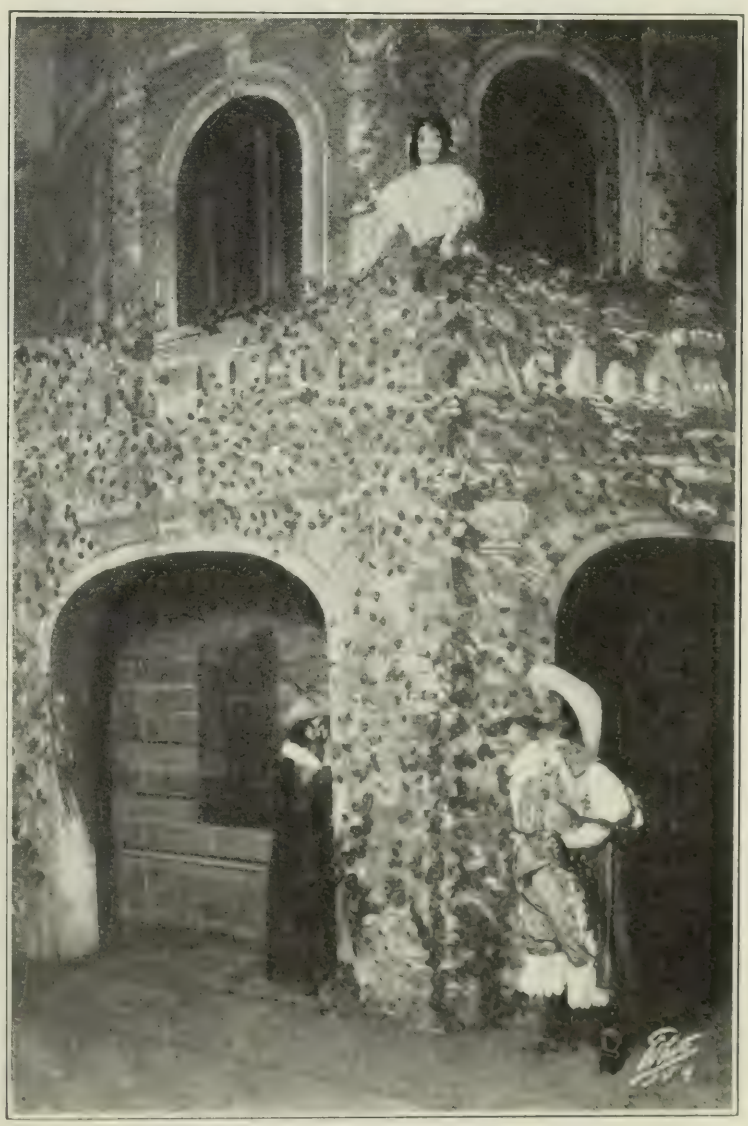
On the whole we believe that the question, tho unanswerable, was well worth asking, and we thank the 1030 readers who took the trouble to send us their opinions.

Neglected Operatic Opportunities

By Henry T. Finck

[In THE INDEPENDENT for April 17, 1913, to which Mr. Finck contributed the article, "Should We Enjoy Our Meals?" we noted the fact that he has been since 1881 musical critic and general editorial writer for the New York *Evening Post*, and has published a number of volumes of musical biography.—EDITOR.]

The centenary of the birth of one of the most distinguished of all French operatic composers — Ambroise Thomas —occurred last year. Few operas in any country have been sung so often as his *Mignon*, not only in France, but in Germany also. The Metropolitan Opera Company had among its artists the most fascinating Mignon the stage has ever seen—Geraldine Farrar; yet this opera was not revived. Its performance would have been more than a tribute of respect to Thomas; it would have been an addition to the monotonous repertory which the public would have thoroly enjoyed, as it did a few years ago when Miss Farrar appeared here as Mignon. As it was, the only sample of the centenarian submitted was *Hamlet*, which was sung once at the Metropolitan, but by the Chicago-Philadelphia Company, to give Titta Ruffo (the operatic T. R.) a chance to show his paces. He was violently applauded, but proved to be of the old-fashioned class of singers who conquer the multitude with stentorian tones rather than with great vocal art.



This year we have the centenaries of the birth of two other composers—Wagner and Verdi. Inasmuch as these two men, with Puccini, supply most of the ammunition for our opera seasons, it was to be expected that something would be done in the way of celebrating the occasion. To be sure, the best works of these masters are always in the repertory, but some of the Wagner operas are sadly in need of new stage settings, which might have been supplied. A good revival of *Rienzi* or *The Flying Dutchman* would have been another way of commemorating the centenary. As for Verdi, there is at least one of his neglected operas which it would have been extremely interesting to hear—the one which immediately preceded his masterwork (*Aïda*) and shares some of its characteristics of grandeur. Its title is *Don Carlos*. Jean and Edouard de Reszke were enthusiastic over this opera and if they had remained on the local stage another year or two, it is likely that it would have been produced. As Verdi was not born till October 10, 1813, it is possible that something may be done in this direction next season. A complete Verdi cycle, including those of his operas which have survived—*Ernani, Rigoletto, La Traviata, Il Trovatore, La Forza del Destino, Aïda, Otello* and *Falstaff*—would surely interest the subscribers.

Not only does the Metropolitan management ignore centenaries—which elsewhere are utilized for pecuniary as well as artistic reasons—but the subscribers also have reason to deplore the neglected opportunites for exhibiting the accomplishments of our famous singers in a greater variety of operas. From all sides come complaints as to the monotony of the Metropolitan repertory. Thirty-five operas in twenty-two weeks does not seem a small number, nor is it. The trouble is that these operas, year in and out, are always the same, and usually also the casts vary little. Madame Destinn's beautiful voice is always heard—and heard with pleasure—in *Aïda, The Girl of the Golden West* and a few other works. She herself has complained publicly of her limited opportunities. She is eager to appear in Weber's *Euryanthe* and some other operas in her large repertory, but the chance is withheld. Madame Gadski and Madame Fremstad both could appear, and appear to advantage, in several times as many operas as those they now are heard in, and the same is true of most of the singers.

Geraldine Farrar not only had no opportunity to appear as Mignon, but she has not been cast for several years in some of her best parts, such as Juliet, Elizabeth, Zerlina, Cherubino, Violetta. Her Elizabeth in *Tannhäuser* is a marvel of poetic subtlety, but the public is not

permitted to enjoy it. Her Zerlina is, in voice and action, the most fascinating impersonation witnessed since the days of Pauline Lucca, as the European critics agreed when she sang this part at the Salzburg festival performances of *Don Giovanni* given in 1906. Saint-Saëns, it was reported, nearly fell out of his box in his eagerness to applaud her. But in New York, apart from her Marguerite, the Goose Girl in *Die Königskinder,* and the tiresome *Le Donne Curiose,* she is heard almost exclusively in the operas of Puccini. There was a glorious chance last year for a revival of *Don Giovanni* with her as Zerlina, and a cast including Madames Gadski and Destinn, Mr. De Segurola and the greatest Don Giovanni of all time, Maurice Renaud; but the opportunity was neglected. There was every reason why this artist should have been engaged for the season just ended for a revival of that great Mozart opera; for *The Tales of Hoffmann,* in which his impersonation of Satan in three disguises is one of the miracles of modern stage art; and for other operas, including *Rigoletto* and *Faust,* not to speak of the great roles he enacted with Mary Garden. But he was not wanted; he was dropped like a chorus singer, hated because of his superiority. Expensive he was, too, besides being a Frenchman — and Frenchmen are not loved at the Metropolitan unless they are mediocre.

Edmond Clément is another great Frenchman who might and should have been engaged. Altho known in France chiefly as an opera singer, in which capacity his popularity is unbounded, he had to come on here as a concert singer, and so great is the charm of his art that he earned over $40,000 in a few months. He was not wanted at the Metropolitan, tho badly needed, for such parts, for instance, as were entrusted to Signor Macnez, who is not of Metropolitan stature, in *Don Pasquale,* and particularly *The Tales of Hoffmann.* With Clément and Renaud, this Offenbach opera might have been performed as well as it was at the Manhattan Opera House. With the cast chosen it fell flat; the real French spirit as well as the romance were missing. The Metropolitan directors were able to secure a monopoly of opera in New York by buying out Oscar Hammerstein; they may thwart his effort to produce grand opera in English in the theater he is building for that purpose by making the Century Theater an annex to the Metropolitan and giving sixteen weeks of English opera there, as threatened. But they cannot obliterate the memories of the superb French performances given by Mr. Hammerstein at the Manhattan Opera House, where he, a man of moderate means, competed courageously with a millionaires' syndicate.

THE SERENADE IN *CYRANO*

Act III, outside Roxane's house. Madame Alda as Roxane, Mr. Amato as Cyrano, Mr. Martin as Christian.

No longer is the Metropolitan a "three ring" opera house, such as it was in the days of Maurice Grau and Heinrich Conried. It has become virtually a "two ring" house, for Italian and German opera. The only French opera done as well at the Metropolitan as these operas were done at Hammerstein's is Massenet's *Manon*. This, with Toscanini at the conductor's desk and Geraldine Farrar and Caruso in the principal parts, is one of the most finished productions one can enjoy at the Metropolitan. It is such a pleasure, also, to hear Caruso in an unfamiliar part. He, too, suffers from the oppressive Metropolitan monotony. He is undoubtedly the greatest tenor of the time and deservedly the idol of the public. No one admires him more than I do, or praises him more lavishly. But I do so long to praise him in something else than the few works he is allowed to appear in—*Aïda, I Pagliacci, La Gioconda* and the Puccini operas. He sang well in the revival of *Les Huguenots*, a "French" opera by a Prussian Jew, Giacomo Meyerbeer; but I should prefer to hear him in real French operas, like *Faust* and the shamefully neglected *Carmen*, in both of which he is admirable. As the Metropolitan is at his mercy —it could not without him prosper as it does now—I cannot understand why he does not insist on greater variety in his repertory. He seems to lack the ambition which made Jean de Reszke rise to higher and higher interpretative tasks. There was a rumor last year that he would sing Tannhäuser in Germany. It was an absurd rumor, for Tannhäuser is not in his line; but Lohengrin is; he has appeared in it in South America, and if he sang it here, that work would once more become the most popular of the Wagner operas. Nor do I see any reason why he should not sing Walter in Wagner's melodious *Meistersinger*. Neglected opportunities!

Many of the subscribers also wonder why Riccardo Martin, the greatest tenor by far America has ever produced, is denied the opportunity of appearing in some of the Wagner operas. He is most unjustly kept in the background altogether. Were it not for Caruso, he would always play first fiddle. As it is, he is indispensable as a substitute for that idol. When Caruso is ill and Mr. Martin takes his place there is little grumbling in the audience. The directors of the Metropolitan Opera House loudly profess their interest in the development of American art. If they are sincere, they should not neglect to give American artists better opportunities than some of them have had.

Interest in American art was not greatly advanced by the Metropolitan production of Walter Damrosch's *Cyrano*. Mr. Damrosch was born in Prussia, but he has been associated with American operatic and concert affairs more than a quarter of a century, wherefore he was entitled to a hearing when he offered the score of a grand opera to be staged as one more experiment in the cultivation of home-made opera. Previous experiments in the same direction had not screwed up expectations very high. To be sure, Victor Herbert's *Natoma* (which has recently been acclaimed in California) proved to be an interesting and individual work; but that opera, tho produced also at the Metropolitan, was brought here by the Chicago-Philadelphia Opera Company.

William J. Henderson, the clever musical critic of the New York *Sun*, who dexterously adapted the libretto of *Cyrano* from Rostand's famous play, summed up the musical results admirably: "It is not at all likely that any one will fall into the error of believing that Mr. Damrosch has added a masterpiece to the gallery of operatic creations. Men do not wait till they are in the neighborhood of their fiftieth year to disclose the possession of creative musical powers."

There is no originality, no individuality in Mr. Damrosch's music. During his long career as a concert conductor he has virtually learned by heart many dozens of great works, and reflections of these could not but light up his score, especially in the orchestral coloring, which is often beautiful, tho somewhat saccharine and cloying. One person, after hearing *Cyrano*, exclaimed: "I feel as if I had taken a bath in tepid sugar water." The tragic episodes of the play are musically treated with some success, but the vivacity and Frenchness of the lighter parts are utterly missing. There are no tunes of the old-fashioned operatic sort

to remember; nor, on the other hand, is the opera a music drama in the Wagnerian sense of the word. The audience at the first performance remained to the end. At the repetitions it dwindled away beautifully by degrees.

Far more interesting was the second novelty of the season, *Boris Godounoff*, even tho it must be said of this also that it is neither an opera nor a music drama. Its composer, Moussorgsky, was a musical Nihilist, who scorned the conventional operatic forms as well as the rules of harmonic sequence established by the masters. His ideas were too "advanced" even for the Russians, and so his opera was not a real success until after he had introduced a love scene, and his friend Rimsky-Korsakoff had pruned, edited and polished the whole score. In its present shape there are very few rough edges, and were the plot and the music more coherent, the opera would stand a chance of surviving in the local repertory. Musically its principal charm lies in the abundance of folk melody, which, however, has the drawback of a monotony resulting from excessive repetition.

Moussorgsky's music alone could never have given this opera its great vogue in Russia. Its chief strength is in its plot—the story of the Czar Boris, who usurped the throne by murdering the boy Dmitri, and who, a Russian Macbeth, is tormented to hallucination and death by a guilty conscience. Altho performed by a mediocre cast, this opera made a deep impression on Metropolitan audiences because of this plot and of the realistic scenes of Russian life, as well as of some very effective choruses.

Besides these two novelties there were two which the Chicago-Philadelphia Company brought to the Metropolitan. One was Zandonai's *Conchita*, a sensational but flimsy production of the young Italian school, and the *Kuhreigen* of the German composer Kienzl, the best thing

JUST AFTER THE CORONATION IN *BORIS GODOUNOFF*

Act I, Scene III, square between the two cathedrals of the Assumption and of the Archangels, Moscow. Mr. Didur, Miss Anna Case and Miss Leonora Sparkes.

in which by far is the interpolated "Marseillaise." Altogether, it cannot be said that Mr. Dippel's contributions to the local opera season were either important or interesting. *Thaïs* fell far short of its former level because Mary Garden did not have the inspiring companionship of Maurice Renaud.

Of French operas only three were sung by the Metropolitan Opera Company during the season just ended, unless *Les Huguenots* be counted as a fourth. Sixteen performances were given in French, five in English, fifty-four in German, eighty-six in Italian. Of the composers, the one most frequently heard was Wagner. His operas were given thirty-five times, as against twenty-six performances of Puccini's and sixteen of Verdi's. Evidently those were mistaken who had feared that under the present Italian management German opera would be routed. What has been antagonized is French operas and French artists.

New York City.

The Cozy Corner on the Roof

A Simple Recipe for a Bit of Country Calm in the City

By Beatrice Griswold

Every city home may have its garden. It does not matter if the grass plot in the dooryard—the only place in the old days where the city dweller might cultivate a bit of nature—has been covered with cement and overshadowed by adjoining brick walls. There is now a new opportunity for garden making in connection with a city dwelling. Within the breeze-swept area of the roof there is sunshine, fresh air and ample space for the home-maker to plant her garden and to have an outdoor cozy corner for all the family to enjoy.

The two essentials for a garden on the housetop are a four-foot railing around its outer edge and a flat wooden flooring to protect the roof. If this happens to be tiled so much the better; it will shed the rain more quickly. But an inexpensive wooden flooring covering all or only the portion of the roof to be used will answer the purpose just as well.

Because of the distressing lack of space in the great centers more than one city dweller has cast about for a place in which to have a few growing plants, where a little time can be spent in the open each day during the warm weather. The result of the quest is the roof garden. In many instances it has started with a few flower pots and an awning, and from this has been gradually enlarged with couches, rugs, reclining chairs and hammocks into a most delightful cozy corner, with pretentious flower boxes and shrubs.

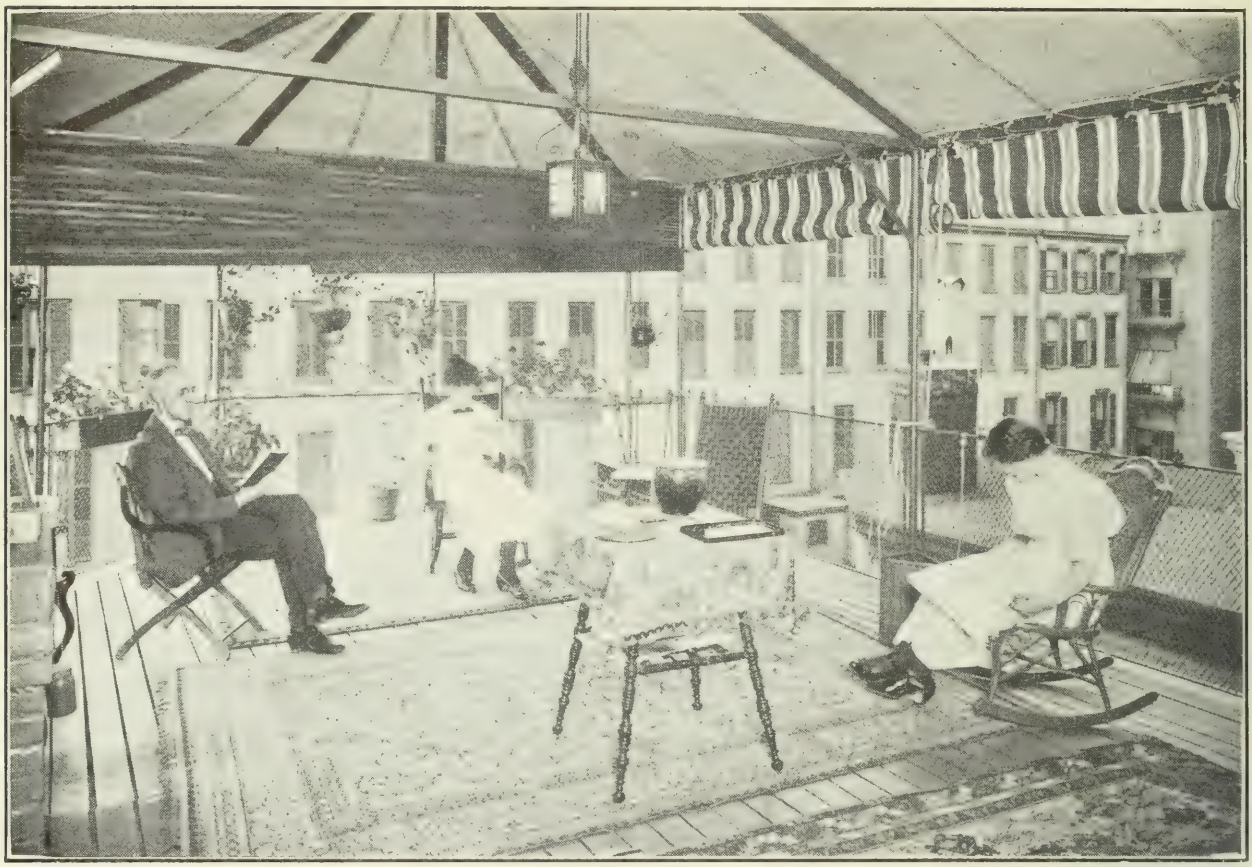
And not only the roofs of private dwellings are being used for this kind of recreation, but the tops of large apartment houses in many cases are being transformed so as to be of benefit to the tenants. Flower boxes have been procured to decorate the parapets, and awnings put up to afford shady nooks, where reclining chairs and hammocks may be enjoyed.

On top of an East Side settlement house in New York City, situated in a district where the sidewalks and tenements swarm with people, and the sun and pure air penetrate with difficulty into the narrow street, there is an inviting cozy corner where the busy workers may have a breathing spell after a day of stress and strain. It affords them practically their only chance of a brief period of relaxation in the fresh air. Downstairs classes and clubs are under way, class bells are ringing and children's voices echo thru the halls. Naturally there is little opportunity for the social worker to rest amid all this activity. But on the roof there is absolute tranquillity. Even the sounds in the street are heard only vaguely, the temperature is several degrees cooler, and there is a more satisfying view of the sky than is possible elsewhere.

The planning of this little garden—a

very simple matter—has given a tremendous amount of pleasure. The idea had its inception in the placing of a single chair in a sheltered portion of the roof by one of the workers who craved a few moments out of doors when her daily tasks were over. From this has grown the miniature roof garden, which all the household is now enjoying. An inexpensive wooden flooring was laid over the space set apart for use, some chairs were added, and a grass rug brought up to cover the floor. A couch was installed for the afternoon "nap." Finally a wooden roof was built over the top for protection from sun and rain, and Japanese porch screens hung so as to drop from the sides. Around the enclosure were planted large boxes with geraniums and morning glories; a lattice work of twine was made for the climbing vines.

This is the coziest place imaginable for a cup of tea in the late afternoon, and at night, when the weather is warm, it is a great boon to the residents of the settlement. There is moonlight and starlight along with the cooling breezes sweeping in from the nearby river. One feels almost thirty miles away from the crowded tenements and congested streets.



In another part of the city an ingenious householder has covered over a portion of her roof with canvas supported by a wooden frame. At the edge she has built an iron railing to prevent possible accidents. Awnings and Japanese screens are suspended over the sides so that the sun may be shut out on warm days and to help insure privacy, as the house is lower than those surrounding it.

Rugs have been laid upon the floor, rockers and armchairs brought up from downstairs, and a tea table arranged in the center. An electric wire has been run across the canvas top and the electric bulbs covered with lanterns, so that it is possible to illuminate this enclosure at night with a pretty, soft light. Thus it may be used for outdoor entertainments the entire summer.

Thruout the city are a number of

SHUTTING OUT THE CITY WITH FLOWERS
All you need is a floor, flower boxes, a simple trellis and some sort of canopy.

THE NEXT BEST THING TO A BIG VERANDA

somewhat similar roof cozy corners. All have been started with the idea of furnishing the householders a breathing space other than in the streets. For there is room on the housetop to move about in as well as opportunities for cultivating flowers. The intense sunlight produces a luxuriant growth, and while the hardier flowers do best, such as geraniums, nasturtiums, asters, marigolds and petunias, almost any variety may be made to grow, including rose-bushes and climbing vines, providing they have sufficient water morning and evening when the heat of the sun is gone. Evergreens and shrubs may be planted in green painted tubs, and a hedge of summer cypress in flower boxes will grow very quickly. This makes a pretty border on top of the parapets and it will partly shut out the view and make the illusion of one's being in a country garden quite complete.

New York City.

In Berlin in May

By Harriet Lewis Bradley

Oh, blue of forget-me-not,
And lilacs in sweetest array,
And rose of the thorn and snow of the thorn,
In Berlin in May.

And the loved laburnum tree,
In many a garden and way,
Giveth joy untold with flowers of gold
In Berlin in May.

And the young Princess Louise
From the Schloss on the river Spree,
Rides, a German bride, by her lover's side
In Berlin in May.

O Princess of Prussian House!
There's a wish in the air today,
Glad thy future be, as flower and tree
In Berlin in May.

Portland, Me.

Bird Music

Do You Know How Original the Robin Is, or How Companionable You May Find the Catbird?

By E. P. Powell

[Mr. Powell wrote from Florida a little earlier in the season: "The first robins have just gone North—much later than usual—and *very few* as compared with ten years ago. Look out or we shall lose them altogether."—EDITOR.]

I have heard a good deal of good music in my life, but the older I get the more I am convinced that the sweetest music in this world is given to us by the birds. I never quite understood this big truth until I was half a hundred years old. I knew the sparrows and the robins and the catbirds as a boy; and ran thru the pastures all the merrier for their music. I learned to distinguish many of the birds by their songs as well as their colors, but the great truth that musicians were filling the air with notes incomparable hardly got hold of me. I paid large sums to hear distinguished singers, pianists, flutists, violinists, but all this while around my head were better artists than any that had taken my money. That is just the point, that these musicians of the air are real artists.

They are not simply letting loose a lot of notes that have no definite relation to sentiment, but, as I hear them now, I distinctly see that there has been invention of the highest order, and this quite as wonderful as anything achieved by Mendelssohn or Beethoven. Each bird family has its own repertory, expressive, in every case, of its life. I am not one of those that believe the whole animal creation lives and acts without reason. As I see it these bird families have been brought into the family relation, differentiated from each other by carefully thought out and worked out methods of living; and their songs are exactly adjusted to these specific life habits.

This great fact first burst on me when listening to the morning chorus of the robins. I had gone North for a few months, after living in Florida where the robins seldom sing. It was a June morning, and the very first sound that I heard was a robin as far in the east, down the valley way, as I could hear plainly. It was hardly more than a call at first, but it immediately jumped into a great shout of praise—at least that was the way it sounded to me. Quickly another robin a little nearer caught the key, and swung himself into accord. These were followed by others, nearer and nearer, until the redbreast that spent his night in the big hemlock by my window flew to the very tip of the tree and sung out what could not have been less than a greeting to the day. It was a hallelujah, in every sense of the word. Already the chorus reached from the center of the valley to my house roof, and from us was moving westward with great rapidity. To right, and to left, and everywhere, the topmost limbs of the trees were filled with robins greeting the break of day. No other birds intruded; only my nearest catbird whistled in a very low key, listening and approving, I am sure.

For the first time in my life I felt that I was listening to the greatest music the world held, the grandest melody that was ever invented. No human melodists had touched this high notch of glory to God in the highest; on earth, peace and good will to men. The robins were not singing this carelessly, but carefully. They *felt* what they were singing; no one could question it. Every robin was happy and telling his delight. His song was definite; not a mere rattle of notes. No one could listen attentively without being worshipful. Here was a genuine religion; told in music and involving love, joy, fellowship and good will. When it was over after a half hour every robin flew down to the lawns and began his daily service for his family. He seemed then to be a plain sort of bird; and when I looked at his poor architecture I could see that his soul had gone in another direction. When the robins ceased the catbirds began to whistle louder, and the grosbeaks ventured a fuller exploitation; and all the world went on as usual.

I know of but one other choral among

the birds, and that is the red-winged blackbird's. It is a curious affair and very sweet. A flock of them in the southern pines occasionally yield to a soloist, but as a rule the whole company sing together; after a leader to be sure, but with a swinging unity that is delightfully charming. Their notes are remarkably silvery, but I do not find any soulful expression as among the robins. It is all delightful, but not inspiring. It is charming, but not indicative of genius.

Among the soloists, I am convinced that the robin is also preëminent; quiet and unsentimental as he appears when picking worms on the lawn, this poet is, after all, in very close relation to all the moods of Nature. Given a golden sunset, especially after a thunder shower, and what the robin can say from the treetop is oratorical, sentimental and musical combined. There is an evident appreciation of the beautiful, and his repertory is always original. You have probably an idea that all robins sing alike. A very little attention and you will find that no two of them sing the same notes. Robin music is so pronounced as to excuse anyone for some carelessness as to its differentiations; but no other bird with which I am at all familiar has so great a power to originate.

Going across my lawns one evening, just before sunset, I heard a call, very musical, but remarkably articulated, and sounding to me like "Hear this birdie!" "Hear this dear little birdie!" I found it difficult to trace the music and discover the singer; but when found it turned out to be "only a robin." Where this enunciation originated I cannot say, possibly with a bird that had been caged. However, it was a persistent song, and was inherited by nestlings, until we had "Hear this birdie!" somewhere about our acres for several years. It was gradually lost. Careful listening, I find, will frequently detect other freaks, articulative or musical, or both, in robin songs. I was stopped not long ago while driving near Utica by a robin call, so utterly distinct from the usual robin music that I was impress with the conviction that we have not come anywhere near the end of the evolution of the robin's repertory.

The catbird leads all others in its versatility and elegance of accomplishments. Its relative, the mocking-bird, does not approach the power of its Northern cousin. It is more voluble, but hardly more versatile; for I have heard the catbird imitate nearly every sound within its range, from guinea-hens to squirrels. Where this bird is entirely at home and forgets fear its performances are wonderful. It is not uncommon for one of them to sit on a limb meditatively, and repeat the music of other birds in a low, quiet key, and thoughtfully, as if rehearsing them. I place him at the head of soloists, not only because of the delicious quality of his composition, but because of his companionability. He is the only bird that comes into personal relations with me in the fields; sings to me; laughs at me; talks to me, and in more ways than one undertakes to express his good will and liking for me, as well as my cherries.

When the singing era is over, that is, about August first, my catbird talks to me in bird prose. Calling out of the thickest bushes, he waits for me to answer; gets impatient if I do not; and finally we chat with each other, not very articulately, but very sentimentally. I wish he understood English better, but we get on fairly well with the aid of whistling; whistling, you know, being a sort of common language between birds and men.

There are other talking birds that I like very much indeed, especially those that come in flocks and groups like cedar birds and chickadees—who sing very little, but chatter a great deal. Most of them are evidently undertaking to express their feelings without regard to who shall hear. The catbird *wants* you to hear; he is communicative in the fullest sense of the word, and as mischievous as a frolicking kitten. Another soloist who comes very warmly into the life of children is the song sparrow. I do not know that he has invented anything very remarkable, but possibly his family song should rank as one of the three or four best bird inventions. Its sweetness and cheerfulness and good-hearted view of the world is complete. How I should like to go back among these bird families and see where each one began to differentiate from the other, just as human races have done by their languages.

Apart from the chippering and companionable chattering of grouped birds, those that hunt food in flocks, nearly all bird music bears a close relation to home life. All our familiar birds in the North stop singing the very moment their fledglings have left the nest. It seems to be a problem in what we are learning to call eugenics. Little birds are to be born right. Home life about them is to be of the highest order. During egg-laying and baby-hatching the father and mother understand that the home spirit must be most beautiful. They pour out their souls in song during these incubating weeks. So it happens that we shall not be able really to appreciate the orchestra given us in the heavens, unless we listen from the standpoint of parents. Shall not we be able to make the world as beautiful about us during the child-bearing period? And yet we must not forget that our baby-bearing period is all the year round, and so we are bound to sing from January to December. Will the spirit of song ever dominate the human family to the extent that it does the bird family?

So I have come to think that singing must in some way have to do with babes and cradles—have something of that sort for inspiration and association. All other singing is mechanical; something turned on to order, soul or no soul. What of church choirs? Why this, that the world never got up anything more out of tune with love and worship, out of taste and out of Nature. It would be a hundredfold more religious to have a big cage of canaries in the vestibule. Singing has a specific place, and it comes, that is real singing does, only as the expression of a complete emotion. This was what Jenny Lind meant, I expect, when she said, "Tell me to sing 'Home, Sweet Home,' and then I will sing indeed."

Birds that do not sing are to be looked on with suspicion. Their home life is pretty sure to be of the slum sort, and their morals more or less vicious. The English sparrow is a case of absolute degeneration. Its home life is vulgar, noisy, indecent and indicative of a mean character. All sin is negative with birds, as it is with men; a lack of aggressive goodness, and this is just where we find that these herding birds must be classed; they have neither home life nor music. Whether the talking birds are to be ranked before or behind the singers I am not quite sure. I do not forget that human speech began with song; and that prose followed poetry in the arts. Bob White is a remarkable character every way; but his talking is better than his singing. It is positively melodious when he comes trailing through the dew of a Florida morning. It is almost singing as he slips in to take his share of the breakfast furnished from the house. I think that a few generations of decent treatment will make this bird a fowl. The common crow is a puzzle. That he is far up in the evolution of reason is certain. His social life is nearly as complex as our own. His games are as full of fun as those of a schoolboy. That crows cannot sing is no wonder; they can talk, and almost articulate.

Some of my Rhode Island reds come quite into the same class—that is, of talkers—only they have to be encouraged a little. I should like to hear from a half dozen farmers' wives who have cultivated the talking ability of their fowls. I have one hen who can carry on quite a conversation. She never lets me go by without a bit of a chat. I first discovered her talent when, as a pullet of a few months, she led seventeen chickens from under my cottage where she had stolen a nest. This indicated good hen common sense; and she raised every one of them. When the job was finished she called me, and told me in pretty good articulation that she wished to go back to the business of laying eggs. I would not think of passing her by without answering her call, that is, as well as I can. John Burroughs! I wish you were here to try the experiment; I think you would say that for once you had found a bird that could reason.

I am not in the mood, however, in this article to combat those who do not believe that birds reason. It is one of those shortsighted notions that come to nothing when we learn to see things out of warm eyes; that is, with hearts behind our eyes. It will not do to go out into the fields full of conceit and defy the right of the birds to come into the great family of God, inspired by the same

Mind and acting with the same Love. How little does the common man appreciate the universe that he has about him. He not seldom overlooks the best part of it. He eats his potatoes, but never hears his robins. He goes to church to hear very good music, but he has a better choir in his back garden. Abolish the causes of fear and you can surround yourself with such a multiplicity of singers, all for nothing, that you yourself shall be able to develop a more tuneful soul.

On my few acres at Clinton I am able to hear in the morning not only the robin, but the red breasted grosbeak, and at noon not only the catbird, but the song sparrow; in the evening the wood thrush and the Wilson's thrush have come out of the woods to live with me and make the evening rich with music. Here in the South the mocking-bird is a flitting vision all the year; but twice during the months when two of them go to build a nest and rear their young, their home life becomes marvelously musical. Then it is that a mocking-bird becomes a violin, a piano, a flute, a whole orchestra. His soul goes out into song and flitters off into melodies until it seems as if the fellow would pass away into some melodious breeze. I do not understand him at all, and perhaps do not appreciate him at his best. His music is everything good, bad and indifferent tossed in together. When he and his wife have a skirmish it goes into song. The shrike, coldest blooded of all birds, has also a singing mood that will carry him occasionally clean out of range of cruelty. I think that by and by this bird will develop a finer character. There's a deal of singing going on here during mulberry season, but to me it is not full enough of soul. Not one of them compares with that supreme artist, the plain-dressed worm-pulling robin of our Northern lawns.

You cannot save our song birds by statute, nor by discoursing on their ability to eat worms. You may get the farmers to put away their guns, and possibly let the birds peaceably take a few cherries; but they will do very little in the way of counting birds into their families, to plant and to build, and every other way to win them into their homesteads. We have been overlooking the best part of the argument, the great moral and intellectual power of these neighbors of ours in the air, the occupants of our homes. The people on the farms must have a warmer appreciation of the companionship that is possible. To open the ears and the eyes of the country folk to a keener apprehension of the bird life—that is on the road to evolution.

Sorrento, Florida.

Pipes of Pan

By Victor Starbuck

O Pan, I hear thy music blow
  Among the misty hills of morn:
  No more doth Triton sound his horn.
Apollo died full long ago,
  As legend saith, when Christ was born.
Yet still, so long as streamlets flow,
While branches sway and grasses grow,
When sunrise sets the world aglow
I hear thy merry music blow
  Among the misty hills of morn.

O Pan, I hear thy pipings pour
  From shadowy dells at hush of noon,
  When thru the cloud-flecked skies of June
The fleet-winged swallows dip and soar,
  And shrill cicadas softly croon.
Deserted lies the fountain-shore,
By white-limbed naiads loved of yore,
And Marsyas leads the dance no more;
Yet still thine airy pipings pour
  From shadowy dells at hush of noon.

O Pan, I hear thy pipes complain
  At dusk along the river edge,
  When zephyrs sway the whispering sedge:
The Elder Gods come not again;
  No more shall Vulcan clang his sledge,
And thou alone dost still remain;
Yet still I hear thy pipes complain
In flutings of the autumn rain,
Or when the lights of evening wane
  At dusk, among the swaying sedge.

Orlando, Fla.

Straining an Historic Friendship

How Our Attitude Is Alienating the Sympathies of Japan

By Hamilton Holt

Managing Editor of The Independent.

On March 31, 1854, Commodore Perry, in behalf of the United States, signed with Japan a treaty of commerce and friendship which opened Japan to the world and inaugurated the most remarkable political and social revolution known to history. The first sentence of that treaty reads as follows:

"There shall be perfect permanent and universal peace and a sincere and cordial amity between the United States of America on the one part and the Empire of Japan on the other, and between their people respectively without exception of persons and places."

From that day to this Japan has lived up to the letter and spirit of that treaty. She has never let an opportunity pass to express her gratitude and to show her friendly feelings to the United States. She has sent her brightest young men to be trained in our universities and technical schools. She has modeled her educational system after ours. She has employed many Americans within the empire as advisers, teachers and administrators. Even at this moment an American citizen, Mr. Dennison, is serving as chief adviser of the Foreign Office.

The United States had an equally unblemished record for cordiality to Japan until the close of the Russo-Japanese War. Then the change began. I take no stock in the charge that the American war correspondents, whose work at the front was so restricted by the Japanese military authorities, started the anti-Japanese cry in a spirit of revenge. Nevertheless, all of a sudden statements began to appear in the American press that we would have to fight the Japanese. They were getting "cocky" as a result of their victories over Russia, and needed to be "taught a lesson." Besides, the periodical English and German war scares were beginning to experience the law of "diminishing returns" and our naval friends and ordnance manufacturers were under the necessity of conjuring up some new adversary against whom we needed the protection of a great and ever greater navy. Then came the law segregating the Japanese in the California schools, as if they were not fit to associate with white children. That stirred up Japan to strong protest, but it ended in Japan's stopping all emigration, so that even students find it difficult to come here today. There is now an excess of Japanese returning home from the United States over Japanese coming to our shores by about 3000 a year. The latest statistics show that in 1911 the excess of Japanese laborers returning home over those coming here was 8966, out of a total population of 70,000 in the Hawaiian Islands and 60,000 on the mainland.

President Roosevelt, however, immediately after the California outbreak, sent the fleet on its voyage around the world, ostensibly on a "peace" cruise, but in reality to "impress" Japan. Japan turned the other cheek by spending a million dollars to entertain it. Here were a people who were brutally insulted by our Pacific Coast, a people we called "heathen" and sent missionaries to christianize, actually teaching us a lesson in Christian ethics. Tho we all but drove them out of California, they met our officers and men, strewing their paths with flowers. Tho we excluded them from our schools, they suffered their little children to greet us singing our national hymn.

Japan has shown similar hospitality to our delegations of merchants and others who have since visited her shores. Yet the pin pricks continued. Bills began to be introduced into the California Legislature to prohibit the Japanese from the coast and to prevent those already there from owning land or engaging in business.

Next came the report that Japan had a secret treaty with Mexico against us, and was to be allowed a Pacific port. That, of course, turned out to be a

"fake." There were also the reported speeches of a member of Congress, formerly of the navy, declaring that Japan was preparing to declare war and seize the Philippines, Hawaii and the Pacific Coast. On February 25, 1911, on the floor of the House, Mr. Hobson prophesied war with Japan within twenty months. Then came Secretary Knox's proposal for the neutralization of the Manchurian Railway, which would have deprived Japan of the rights on the mainland she had gained by the treaty of Portsmouth and have destroyed her preponderant influence on the border state facing her Korean frontier.

Next appeared a scheme of American capitalists to build the Chinchow-Aigun Railway, to rival the South Manchurian Railway, in China. This was followed shortly by the proposal from bankers, originating here, that a syndicate representing four Powers—the United States, England, France and Germany—should loan China $50,000,000, the interest to be guaranteed by all the unhypothecated resources of Manchuria, thus dethroning Japan from her primacy in Manchuria and all China. Tho the Knox neutralization plan and the American railroad scheme fell thru, and the bankers controlling the four-Power loan subsequently invited Japan and even Russia to join their circle, these proposals made a very bad impression in Japan.

Then in the early part of last year, a measure known as the Dillingham bill was favorably reported to the Senate by the Committee on Foreign Relations, which would have excluded the Japanese from our shores as the Chinese are now excluded. Fortunately, the exposure of the "joker" in the bill led to a modification of the anti-Japanese clause. But in the meantime the news had been cabled to Japan and the harm had been done.

Immediately upon that, Senator Lodge revived the Magdalena Bay war scare by imputing that Japan was seeking concessions in Mexico, in violation of the Monroe Doctrine. Altho it was soon proved that Magdalena Bay was in the rainless belt of lower California, in a region in which nothing grows except cactus and a few stunted cedars, and that a single spring among the sand dunes was the sole supply of the diminutive fishing village on its shores, the Senate passed a resolution to the effect that the Monroe Doctrine applied to such cases. The Senate also, in emasculating the great Taft-Knox peace treaties with England and Japan, gave Japan another slap by adopting an amendment reserving from arbitration the question of the "admission of aliens to the educational institutions of the several states."

And now the California Legislature is in session again and already thirty-four anti-Japanese bills have been introduced. Some of these bills provide for increasing the license fees of Japanese fishermen from $10 to $100, for the segregation of Japanese school children thruout the state, and for the imposition of a special poll tax upon the Japanese. Others prohibit the Japanese from employing white girls, from using power engines, and from taking out liquor licenses. But by far the most dangerous is the Bradford Alien Land Bill, which would prevent the Japanese from owning land in California. If this passes we shall probably lose the friendship of Japan for years to come.

I do not wish to discuss the question as to whether the Bradford bill contravenes our treaty with Japan or not. If it does, as seems almost certain, it will, of course, be nullified by the courts. But as I have recently visited Japan and have had opportunities to learn more than most of my countrymen of the real feelings of the Japanese toward us, I consider it something of a duty to speak plainly now. Up to the end of the Russo-Japanese war the Japanese regarded us with a feeling almost akin to reverence. There existed in Japan a very strong sentiment—a sentiment entirely separate from commerce — connected with the name of America. Even today the Japanese, next to the preservation of the Anglo-Japanese alliance, desire our commerce and friendship. They will do anything we ask of them, provided they can do it with dignity. The evidence is overwhelming to anyone seeking the truth. Two years ago, for instance, when Japan learned that we were preparing to negotiate an unlimited arbitration treaty with Great Britain, she voluntarily consented to a modification of the Anglo-Japanese alliance, so that in case Japan and the

United States were at war England would not have to choose between breaking her alliance with Japan or her peace treaty with us. Surely Japan would never have renounced the right to call on England for aid if she had reason to expect any further trouble with us.

It must be remembered, however, that there are forces in Japan that are working against this historic friendship, just as there are in this country. Without attempting to put them in the order of their importance they would include: 1st, the ignorance and incompetence and anti-Japanese bias of many of the officials we send to the Far East; 2nd, the exceeding jealousy of nations like England and Germany over our increasing trade in Japan. The best informed student of Japan I met abroad told me that "nine-tenths of the false rumors that have tended to damage the standing of American traders in the Far East can be traced directly to rivals in trade"; 3rd, the journals and foreign correspondents in Japan and China who assume for one reason or another an anti-American attitude. All foreign papers published in English in Japan, with the exception of *The Times* of Tokyo, seem to be disinclined to print matter which might tend to increase the good relations between Japan and America; 4th, the agents of ordnance manufacturers and ship builders. I am told that these agents are many in number and plentifully supplied with "expense" money and "entertainment funds." It is a significant fact that none of these agents preach anything but the antagonism of America to Japan, and 5th, the lack of manners of Americans who live and travel in Japan.

But these and similar causes that promote dissension, would have had little effect in Japan except for two things—American interference in Asiatic politics and the brutal discrimination against the Japanese in California.

These the Japanese cannot explain on any grounds that are not discreditable to the disinterestedness and high moral professions of our people. Take our recent meddling attitude in Manchuria. Secretary Knox's plan—and remember that the Secretary was the official spokesman of the whole American people—was much the same as tho Japan went to our border state, Mexico, and said: "See here, Mexico, the United States has a good deal of money invested in your territory. It is a menace to your integrity. We suggest that you let us raise a loan, so that you can pay back the United States what you owe her and then tell her to get out. You can come to us for all future loans." If such a proposition were made by Japan to Mexico, nearly every editor in the United States would be shrieking for war. But the Japanese are a very self-controlled people. They said very little. They felt, however, that they have the same right in Eastern Asia that we claim in this hemisphere under the Monroe Doctrine, that is, the inalienable right to take any proper course requisite for self-preservation.

In regard to the immigration question Japan does not object to having California pass anti-alien bills, provided they apply equally to all nations and do not discriminate against her. What she cannot understand, and what she will not tolerate without intense resentment, is to have her highly intelligent, adaptable, industrious, cleanly, sober, peaceable and efficient citizens excluded simply because they have yellow skins, while the illiterate, quarrelsome and unwashed emigrants from Europe are welcomed with open arms.

Japan cannot understand how a mere 40,000 of her citizens, who have the highest standard of literacy of any aliens on the Pacific slope, and who own but 17,000 acres of land, and whose numbers are decreasing every year, can be a menace to a population of 2,377,000 souls living in over one hundred million acres of territory. Indeed, in 1911 the Labor Commissioner of California, Mr. Mackenzie, submitted an official report on the Japanese in that state in which he concluded that the Japanese should be encouraged to come to California, because in many respects they are more desirable workers than the white men, and because there is not enough available white labor to do the work that is crying to be done.

Now, of course, there will be no war between Japan and the United States. Such a contingency is well nigh unthinkable. But if California persists in exclud-

ing the Japanese from our shores, all our foreign merchants and missionaries in Japan might just as well pack up and come home. There will be nothing for them to do hereafter in the Land of the Rising Sun.

Is it right, therefore, that we should lose the friendship of 50,000,000 long-forbearing, friendly but proud and sensitive people, just because a selfish and sinister element of the great State of California has for the moment got in the saddle and proposes to thwart the will of the entire American people to gratify its flimsy whim of a reckless race prejudice? The question is not primarily political, but moral. It is the Golden Rule.

New York City.

Japanese Exclusion

By David Starr Jordan, LL.D.

President of Leland Stanford, Jr., University.

Most people on the Pacific Coast would regret to see a stratified labor population; the men at the bottom Asiatic because underpaid, underpaid because Asiatic. Under the "gentleman's agreement of 1907," no Japanese laborers have reached California, Hawaii or British Columbia for six years, and the relatively few remaining here are rising toward the upper rounds of the labor ladder.

The most of the people of this state are satisfied to let well enough alone. A few are not. Under the American system, anybody can get any bill he pleases introduced into the legislature. The introduction of a bill means nothing, and anti-Japanese bills at every season find their place on the calendar. In the present season, all these bills center on the land question, and some of them seem to have considerable support. One of those under consideration proposes to prohibit all alien ownership of land. Others affect only the Japanese either directly or under the subterfuge of "those ineligible to become citizens." As to these, the following considerations are pertinent. To prohibit alien ownership would affect millions of property held by Englishmen and Canadians. There may be something to be said on either side of the question, but it is a change of policy too great to be adopted offhand and as a side issue.

In the House Tax case in Japan ("British Isles, France and Germany vs. Japan"), decided in 1905 by the Hague Court, it was ruled that a nation could not change the tenure of property actually held without the consent of the alien owner.

This would seem to invalidate all propositions for forcing the alien, either Japanese or English, to dispose of his property within a specified time.

Under our Federal Constitution, no state can deal directly with another nation, nor with its people, nor with any group of its people, as members of a particular nationality. All such powers are reserved to the nation. To the state, all aliens stand on the same footing. All aliens in the United States are here in a sense as wards of the nation, deriving their rights primarily from international treaties.

If this principle is correct, any anti-Japanese laws pased by a state must be unconstitutional. In which case they must be declared null and void when brought before a Federal court. If in contravention of an United States treaty they become also null and void.

The validity of the statute excluding "Mongolians" from naturalization has not been tested in the higher courts. Moreover, it will not be easy to prove that the Japanese are Mongolians.

If any action is taken, its validity should be tested in the courts. Under our complex federal machinery, the central government has no responsibility until its courts have decided whether or not a local statute under question is valid.

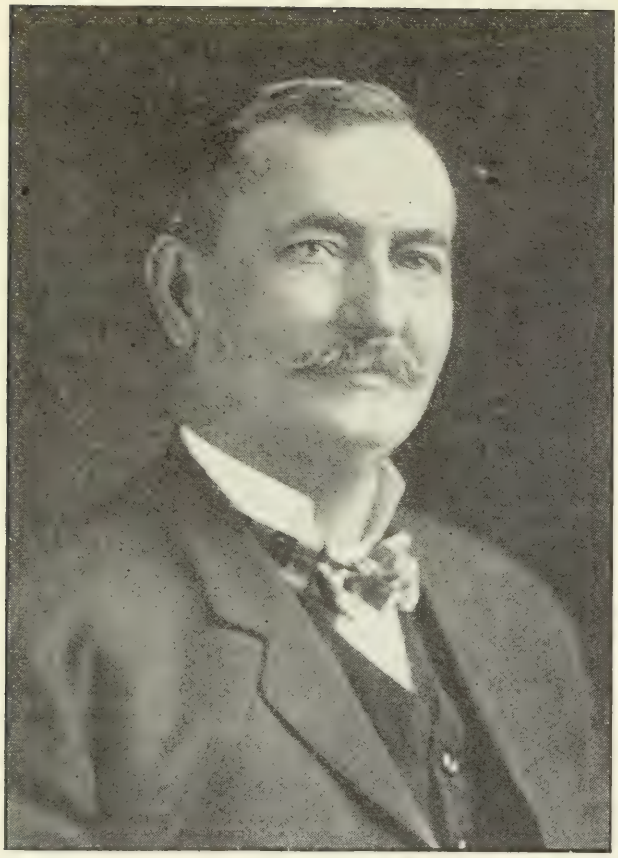
Stanford University.

Men We Are Watching

By a Washington Journalist

Joseph P. Tumulty

SECRETARY TO THE PRESIDENT.



Thanks to Cortelyou and Loeb, the office of Secretary to the President was lifted to a dignity tempting one to consider it second in political importance only to that of the President. President Taft was not so successful in all of his four selections, and with a single exception his administration was weakened and hampered by the men who stood for him, which causes one to look both cautiously and anxiously at Secretary Tumulty, wondering how effectively he will fill the important post. It is no sinecure today—being Secretary to the President. He must be a cyclopedia of details upon every subject which can come up, and the President is often forced to rely upon his judgments and conclusions. He must possess the inherent genius for doing and saying the right thing at the right time. Of the hundreds of letters daily received at the White House very few can even be called to the President's attention. The secretary is responsible for the replies. In spite of the "open door" which was talked about, the secretary's office will be assailed from morning till night by people who think they should go straight to the President, but must be finally disposed of without reaching him or being sent away disgruntled. And then the press. Scores of newspaper men have learned to hang upon the Secretary to the President as the mouthpiece for all that is allowed to escape the safety vault of state secrets. The office requires the delicacy of the diplomat, the facility of the politician, courage, common sense, and the patience of Job.

There is no small compliment implied in the comments which have appeared in the press to the effect that Secretary Tumulty is the right man for the place. The President based his judgment upon experience, for Tumulty was his secretary while he was Governor of New

Copyright, Clinedinst, Washington

JOSEPH P. TUMULTY, SECRETARY TO THE PRESIDENT

JUDGE WILLIAM CHARLES ADAMSON

Jersey. He based the first appointment partially on his secretary's record of four years previous in the New Jersey Assembly, where he made a fine record, fighting vigorously along lines which the President heartily approved.

Secretary Tumulty began his political career early, for he is even now but thirty. He was born in Jersey City—one of a family of thirteen—educated at St. Peter's College in Jersey City, where he was admitted to the bar in 1902 and married in 1903. His father was a politician before him and he has been a politician himself practically all his life. Following his father's example still further, he is already th father of four girls and two boys. He comes to Washington with the reputation of being an invincible fighter. He has the refreshingly vigorous and sturdy physique of courage to defend convictions, and a broad forehead and clear eye indicative of capacity to come at convictions intelligently; with a square jaw and firm mouth forming an appropriate go-between. But beyond this there is nothing suggesting the fighter; rather all of the other qualities desirable in a successful secretary. He is rather short, with light hair, laughing eyes and quiet, dignified manner, and a knack at cordiality which is winning him friends everywhere. We all wish him complete success in his difficult field, not only for his own sake, but for the sake of the President—and he bids fair to achieve it.

Judge William Charles Adamson

MEMBER OF CONGRESS.

The Panama Canal of itself claims world-wide attention, as it nears completion, with the added interest caused by a decided conflict ot opinion concerning some of the rules and regulations for its conduct, especially the clause granting free tolls to American coastwise shipping, which passed with the last canal bill. With Senator O'Gorman, of New York, placed at the head of the new Senate Committee on Interoceanic Canals, where he can best force his determination to keep the clause in the bill, all the more watchful interest centers in Judge Adamson, Member of Congress from Georgia, who heads the House Committee and is radically opposed to the free toll clause. He will lose no opportunity to advocate its repeal in the House.

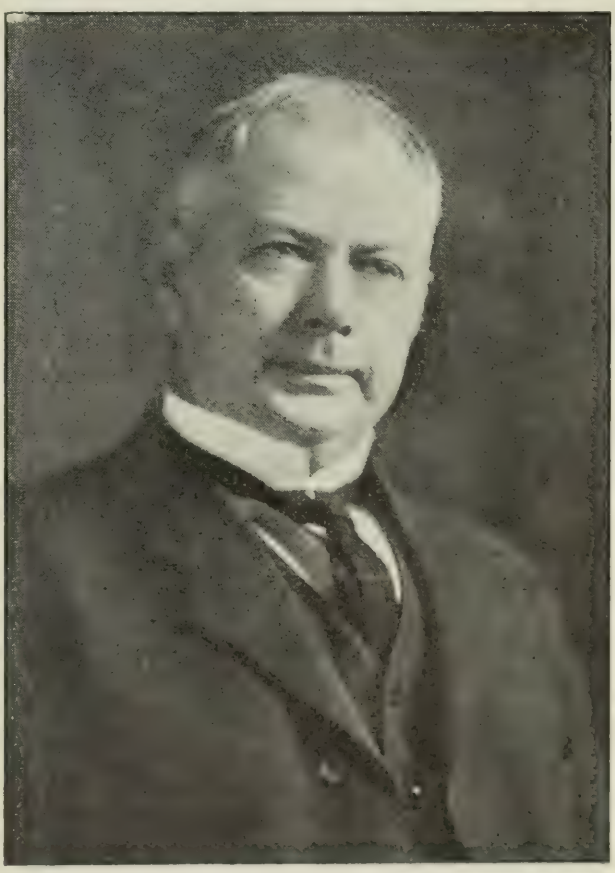
Judge Adamson was born in Carrollton, Georgia, in 1854. He was graduated from Bowdoin College, and was admitted to the bar in 1876. He has always resided in Carrollton, where he was city attorney and then judge of the City Court, till he was elected to Congress, where he has served without interruption for seventeen years. His record in Congress is one of persistent fighting and frequent victories against material odds. He claims that some of his most important work has been the unremunerative labor of preventing bad legislation, and in that he is correct. He has been particularly effective in canal and railway legislation.

Judge Adamson is a most agreeable man to meet, cordial and democratic, tall, strong mentally and physically, always ready to be cordial, but never afraid to express his convictions and defend them. He is emphatically honest and determined, an independent thinker, a good friend and a—but it will be better to have him remain friendly.

He does not show his age. His thick brown hair is only touched with gray,

and his eyes are as ready as ever to see a joke. He is particularly fond of home life, especially life on his farm, where he works with his own hands whenever he can be there. He says that the only habits worth forming are to work, to pray, to save money and to respect your fellow men.

Albert S. Burleson



POSTMASTER-GENERAL.

Among the strictly wide awake ones in the President's Cabinet is Albert Sidney Burleson, the new Postmaster-General. At the present moment there are few in the country attracting such wide attention—not so much because he holds an office which is looked upon as almost a bottomless pit for the reception of office seekers, but because from the moment of his appointment and confirmation he dropped politics, in which he had been one of the most vigorous fighters of the party, and assuming that the Post Office Department was a colossal business institution, to be run for the benefit of the whole country, upon strictly business principles, he immediately got down to real business.

Already he has advanced several propositions, more or less startling, which have won the commendation of Democrats and Republicans alike—and incidentally roused considerable ire in both parties. He will have further suggestions to make in a short while, just as soon as scouts which he has out on various trails make full reports to him. In talking of one of these matters to the writer the other day, he said: "I shall not have an easy time of it, for I shall be opposed by two very strong factions, one because I am going too far, the other because I am not going far enough. But I shall do it."

That is Burleson, the new Postmaster-General, just as it was Burleson, Member of Congress for the past fourteen years, and Burleson, district attorney for the capital district of Texas for eight years, and city attorney for Austin, Tex., before that. He has made good as a vigorous and fearless fighter all along the line. You can go back further, if you will, and find his father, Captain Ed Burleson, at the head of an organization of Texas rangers fighting Indians and Mexicans all over the state, and earlier, his grandfather, General Edward Burleson, the right hand aid of Sam Houston, winning the battle of San Jacinto, cutting Texas free from Mexico, and coming within some 200 votes of election as President of the Republic of Texas. So it runs in the blood.

The Postmaster-General was born in San Marcos, Tex., just half a century ago; college and university educated in Texas and admitted to the bar there. He is an ideal Texan—tall, strong, full of courage and energy, tempered by invariable kindness and courtesy; with a fine face, firm, determined, with quick, keen eyes and a forehead made for thought. He is also a typical Southern gentleman, with all the grace, culture and dignity pertaining thereto. He might be dangerous in the position he occupies; but all who know him appreciate a feeling of relief that the great Post Office Department has fallen into such hands. A better selection could hardly have been made and it is a safe guess that when he leaves the office he will be remembered thru many practical reforms as one of the most valuable and efficient Postmasters-General.

ALBERT. S. BURLESON

THE NEW BOOKS

The Makers of Maine

The subject-matter of a volume by Herbert Edgar Holmes, suggested by his title, *The Makers of Maine,* is amplified in the sub-title: "Essays and Tales of Early Maine History, from the First Explorations to the Fall of Louisburg, including the Story of the Norse Expeditions."* In 250 pages the State Librarian of Maine retells with great enthusiasm the narratives of some of the French and English explorers and settlers; always with a fine appreciation of their better qualities, especially the heroism of the Jesuits whose noble part in the development of the New World no one today is narrow-minded enough to belittle. Unfortunately, however, Mr. Holmes, in making numerous allusions to Fiske, Bancroft, Parkman, and other secondary authorities, and quotations from their works, invariably adopts a carping tone, apparently because these writers are not sufficiently French in their sympathies, and are deemed to be "bigoted" and unduly prejudiced against the French missionaries. For his part, Mr. Holmes sees every member of the Society as white as ever a Protestant fanatic saw him black; he even refuses to believe Father Biard a traitor. The Maine historian's combativeness, together with a carelessness which strews his pages with misspelled words, French words without the accents, and bad punctuation, serve to accentuate the stylistic limitations of these diverting studies.

Marc Lescarbot, in spite of his native malice and skepticism, and in spite of his having expounded Scriptures to his sailors out of the Genevan version, is something of a favorite of the author's —as well he may be. Lescarbot furnishes, in fact, some of the most delightful material for a volume which, notwithstanding obvious faults, must certainly attract all those of us who spend vacations in the Maine woods, or somewhere along that stretch of "two hundred miles of intermingling land and ocean, where, lost in each other's embrace, the sea seems in love with the land, and the shore with the foam-crested wave." This passage is culled, by the way, from Du Peyster's *Dutch in Maine;* here is a quotation from Mr. Holmes himself, paraphrasing Lescarbot, who in spite of his aristocratic spirit put his finger on the reason for the failure of the French in the New World:

> In those days this employment [agriculture] was regarded as degrading for a gentleman, it being the work of peasants and serfs. He, however, looks upon it as the noblest and most independent of all works, "the pursuit of our first fathers, of the kings of old, and of the greatest captains in the world."

"Lescarbot was many years ahead of his times," is Mr. Holmes's very proper commentary.

But we are inclined to regard the Maine historian's chief service quite other from that proposed. We are grateful to him for bringing us back to a rereading of the writer whom he loses no opportunity to slight. Francis Parkman it was who awakened us all to what of romance there is in the history of our new country—a country upon which the sun shines brightly, but with a hardness sometimes wanting in half-lights and gentle reticence. What passages one finds in Parkman!

> The French dominion is a memory of the past; and when we evoke its departed shades, they rise upon us from their graves in strange, romantic guise. Again their ghostly camp-fires seem to burn, and the fitful light is cast around on lord and vassal and black-robed priest, mingled with wild forms of savage warriors, knit in close fellowship on the same stern errand. A boundless vision dawns upon us; an untamed continent; vast wastes of forest ver-

**The Makers of Maine.* By Herbert Edgar Holmes, LL.B., State Librarian of Maine. Lewiston, Maine: The Haswell Press.

dure; mountains silent in primeval sleep; river, lake, and glimmering pool; wilderness oceans mingling with the sky. Such was the domain which France conquered for civilization. Plumed helmets gleamed in the shade of its forests, priestly vestments in its dens and fastnesses of ancient barbarism. Men steeped in antique learning, pale with the close breath of the cloister, here spent the noon and evening of their lives, ruled savage hordes with a mild, parental sway, and stood serene before the direst shapes of death. Men of courtly nurture, heirs to the polish of a far-reaching ancestry, here, with their dauntless hardihood, put to the shame the boldest sons of toil.

This is not perfect style; already it sounds old-fashioned, not as historiography alone, but even as rhetoric. Yet we still vibrate in tune with its sonorous periods. We know the stock objection: Parkman is too literary to make good history. The passage quoted is, however, only Parkman's invitation to his public; a paragraph from the Introduction to *Pioneers of New France.* And suppose one consider Parkman in his totality as only an introduction—subject as he is to the corrections of later investigators; what then? There is still room for him, and we hope that he will thrill the imaginations of our children and our children's children as he has thrilled ours. In this age of make-believe "scientific" history, it is a delight to happen upon this truism of his, which perfectly accords with the view exprest by Mr. Roosevelt last fall at Boston:

> Faithfulness to the truth of history involves far more than a research, however patient and scrupulous, into special facts. Such facts may be detailed with the most minute exactness, and yet the narrative, taken as a whole, may be unmeaning or untrue. The narrator must seek to imbue himself with the life and spirit of the time. . . . . He must himself be, as it were, a sharer or a spectator of the action he describes.

The historian must, in fine, be more than an accumulator of dates and figures; he must be blest with the psychological genius and the literary sense, no less than with patience and fairness. Parkman had some share of all these talents, *pace* Mr. Holmes; and he was endowed to an uncommon degree with the dramatic instinct. We re-read him with gusto; and our re-reading today is thanks to the good author of *Makers of Maine.*

A "New" American Novelist*

Mr. Trites was formerly a newspaper writer in Philadelphia. If one did not know this from anything else the fact would become apparent in the reading of his novel, *John Cave,* the sordid romance of a brilliant young journalist, almost as weak willed as the hero of Flaubert's *Education Sentimentale.* John Cave, who dissolves his talents and his love in vulgar dissipation, is a figure less real than the world he moves in. Alternately he seems a man of natural instinct and powers, with whom we sympathize in his depressions and weaknesses, and a personality essentially repellant, for all his youthfulness; selfish, intolerant, ungracious. He caps the climax (so far as the Philadelphian is concerned) by indulging a constant tendency to bait Philadelphia and her most sacrosanct institutions. The polite Browning Club becomes the burlesque "Emerson"; the Assembly becomes the "Annual Camphor Ball"; Chestnut street, of radiant shop windows, is irreverently renamed "Peanut." The same disrespect for the old city is manifest in a second novel by Mr. Trites, called *Life* in the English edition (which has achieved high praise), and *Barbara Gwynne* in the American.

Mr. Trites calls the newspaper which employs his John Cave the *Press.* It happens that there is a local newspaper of that very name—a journal with a most promising past. The novelist's *Press* is, however, a composite caricature rather than a photograph of the *Record,* or the *Ledger* or the *Press* by itself.

It was as a news gatherer for this same *Press* that Richard Harding Davis wrote *Gallagher*—the prototype. But *John Cave* is hardly in this line of tradition. This is a record of a star reporter's failure; not the usual story of a cub's triumphal emergence. Perhaps it is the more moral, the truer of the two varieties. Those who do not read *John Cave* because its scene is Philadelphia may read it as a reflection of newspaper-making's gloomier aspects in two great Eastern cities.

**John Cave.* By W. B. Trites. New York: Duffield & Co. $1.25. *Barbara Gwynne.* By W. B. Trites. New York: Duffield & Co. $1.25.

"A village," is the hero's comment upon the Quaker City before his departure for New York; "an overgrown village." Mr. Trites is wholly conscious of his scene's provinciality, but oblivious of the charm which is, as so often, that provinciality's compensation. Perhaps he knows the pleasanter side of life in the quiet city where journalism is unhurried and young men are wasted on cornerstone layings, and faded graybeards sit at a desk and soil lively "copy" with rubber-stamp corrections, but his hero, John Cave, spends too much of his time drinking champagne (journalists in stories always drink champagne!) with a certain young Prudence, whose inappropriate name was never entered in *Boyd's Blue Book*. In the circumstances, John Cave learns nothing of the real Philadelphia, unless indirectly thru the young girl whom he deifies, marries and loses. The city remains, for Cave, the dull suburb of New York which it appears to yawning, empty-browed drummers at the Hotel Continental, or Green's, in "Peanut" street, or at the ruddy Bingham House, further west. But Mr. Trites not only demonstrates in his story his own powers of observation, and his depths of youthful pessimism; he also holds our interest thruout the tale of reporting and "ad" writing and syndicating and human frailty. One has no difficulty in visualizing the scenes and incidents set forth, tho some may at the end feel, as they do after reading a well composed newspaper "story," that the cleverness of it all was used to no good end. A certain hardness about the story-teller's manner, not really out of place in this particular tale, bodes ill for the future; hardness and youth not being well assorted. And Mr. Trites's friends will do well to warn him against overvaluing and overworking his vein of cynicism. It is not a rare or even a profitable vein.

The novelist's war upon the spread-eagle and upon hypocrisy is a holy war. Yet it would be infinitely more effective were his view judicial or reflective rather than jaundiced. American business does not consist solely in cheating gullible customers, as is suggested. Neither does the American business man *always* go about unshaven, as Mr. Trites would have us believe. American taste is crude, inconsistent, but not (we believe) deserving of such a hiding as it gets in *John Cave* and *Barbara Gwynne*. Even if it does deserve the hiding, the writer's effectiveness as a social historian and as a story-teller is reduced by his reiterated exaggerations.

Kindly Mr. Howells has praised the new novelist. One can readily comprehend the grounds of sympathy: Mr. Howells's admiration for the younger man's frankness and keenness of sight for local shades. Some readers, less critical than Mr. Howells, will dislike Mr. Trites because his stories are harsh in outline and wholly depressing; for, tho the novelist can call up the beauty of maidenhood, the vision is fleeting, and the seer has no illusions. "I'm young," says the cold-blooded young surgeon of *Barbara Gwynne*, "but I know well that life is hideous." Disillusion without so much, either, as France's tender contempt for the human race is distressing always, and seems so most of all in America, where novelists turn the literary shop into a confectioner's.

In his qualities, as in his failings, Mr. Trites stands out apart from native contemporaries. However higher one may place Mr. Howells's *Silas Lapham* as a novel of our life, each of the present volumes of Mr. Howells's "discovery" has true distinction, contrasted with the banal rank and file on the bookshelf of our recent fiction. In *Barbara Gwynne*, for instance, the novelist owes more to the Wells of *Tono-Bungay* than to any one else. Mr. Dreiser is more painstaking and more sober, and his work has more solidity, but Mr. Dreiser wants the other's compactness and vivid play upon lighted surfaces. Mr. Trites is telling in description, apt in his thumb-nail sketches; he fails in the effort to paint full-length portraits. Fortunately he is already too competent, too honest an artist to be treated with condescending tenderness or delicacy.

The author of *John Cave* has within himself the makings of an enlightened and fearless satirist of our society. And it is natural that this young writer should have no mercy for that society which produced him; it is the way with the young in all lands and all times.

Made in England

The native author, stealing quietly into the book store that he may see how his latest production is staged for the prospective buyer, is often alarmed now to find his own little hill of gay volumes overshadowed by a mountainous pile of novels bearing every evidence of having been made in England. Arnold Bennett himself takes up nearly half the store, and there are many others. Let this bitter discovery prove not too heartrending, for there seems to be room for all. And after all, is there not something to be learned from this invasion by our cousins? The made-in-England fiction may sometimes lack freshness, but as a rule it must be recognized that the workmanship is admirable, and the ideas embodied unhampered by the fear of free speaking and thinking with which some of our native editors and publishers freeze cold the imagination of the aspiring writer.

Those readers who have been tempted by the prospect of dawdling in English scenes may unsuspectingly find themselves in a morass of dialect, but they must be ready to use their wits to extricate themselves and to find pleasure even in that.

Let not the fact that Mr. Charles Lee employs the dialect of Cornwall prevent you securing as much as he writes, for he will give you pleasure undiluted. He has taken a little corner of England for his own, and draws its characters with loving hand. He has the gift of laughter, gentle and kindly, yet with an occasional bite to it, a pleasant strain of fresh, healthy sentiment, an exceptional power of characterization and a good clean style. In *The Widow Woman* (Dutton, $1.25) we have the story of Widow Pollard, who has buried two husbands and is looking for a third. She is a woman of substance with her fishing smack, her cottages and her bank account. Of course, she has suitors galore, but she listens to the insinuations of Mrs. Poljew that her brother Jan is the proper man for her. Jan has other ideas, having already fallen in love with a young girl, Vassie, but nearly succumbs to the nagging of his sister. Charles E. Brock contributes a number of pleasant drawings in harmony with the text.

Port Vean is a stronghold of conservatism, as *Paul Carah, Cornishman,* finds when he returns from America to his native fishing village (Dutton, $1.25). His new ideas and "hustle" only incur ridicule, and he is looked on as a foreigner by all except Ben Jose, with whom he goes to live. Ben has a daughter, and what follows is a tragedy, Jennifer, from hating this bragging stranger, learns to love him, principally owing to his kindness to a defective, Dummy. Paul prospers for a while, but the machinations of his enemies are too strong; he is taken in the act of smuggling, and he leaves Port Vean to return to America. A word of explanation remains unspoken by Jennifer, and she is left behind. This is a tale told with perfect artistry, and the descriptions will leave the reader in accord with the conviction of Paul that "there edn' no kingdom on earth to come up to Cornwall."

In *Our Little Town* (Dutton, $1.25), Portgulyan—famed for fuschsias and cats—Mr. Lee makes us free of the club presided over by Penticost, the cobbler, with its members, Bessie's Tom, that wit Sam Jago, James-over-to-shop, and of Juliana Julyan's establishment for mangling and gossip; allows us to inspect the Gov'ment whitewash and brass buttons, and assist at the settlement of several domestic differences and love affairs. There are tales, too, of Cornish pixies, giants and saints, and vignettes of Cornish worthies. A book to enjoy.

Somewhat different, tho also dealing with fisher folk, is a series of Devonshire studies by Stephen Reynolds, entitled *How 'Twas* (Macmillan, $1.60). There is the tang of the salt sea in its pages, and the impressions are vivid and fresh, couched in an easy flowing style. "Silly Saltie" comes very near being a masterpiece. Included are some pictures of babies and cats, and a dog sketch, full of the sympathy of a man who loves them. Some Parisian silhouettes and an account of a trip to Marseilles with a fisher friend round out a volume of merit.

The English public school is an institution of ancient standing which has been coming in for a good deal of severe criticism in English periodicals. Its opponents claim that it turns out neither men nor scholars, but young snobs and manufactured mediocrities. *In Fathers of Men* (Scribner, $1.30), E. W. Hornung, of Raffles note, gives us a lively and sympathetic picture of a public school, the trials and tribulations of a young boy who has had little education, and his surmounting of the difficulties placed in his way by some of his masters and fellows. It is an honest, healthy story of good purpose, with several likeable characters, notably the master, Mr. Heriot, and conveys a good impression of what life in a large school really is. Tho ostensibly for boys, boys of all ages are bound to find it interesting.

The Williamsons, those indefatigable

purveyors of travel romances for armchair voyagers, have been busy again. This time Scotland is the land over which we are borne in company with a motor car, a love romance and a cicerone who knows everything of interest. The heroine runs away from her grandmother to join her mother, an actress who has no use for a grown-up daughter. The girl is succored by a millionaire artist, a real Highlander, and the journey to the mother is undertaken by motor. There is a chaperone—she of the guide-book knowledge—so all is well. Two other people are motoring, an authoress, who, with her brother, by a strange coincidence—ah, waggish authors—writes just such novels as this. They interfere with the romance, but not enough to prevent wedding bells. There are American tourists and others as "walking gentlemen" in the drama—tho they, too, career about in motor cars. Readers of *The Heathermoon* (Doubleday, $1.35) may wander about the Scott, Burns, Carlyle, Crockett country and the Highlands without any fear that there will be anything so daring as an unhappy ending to the romance of their companions.

Tom Gallon can be usually depended upon to give his readers a story to provoke tears and laughter. In *As He Was Born* (Doran, $1.20) he furnishes a whimsical romance full of delicious touches. A young spendthrift is left a fortune by his uncle, provided he enters his uncle's home town in a state of nudity and acquires clothes and an honest living in the town for a month. The first part is easy, and he only fails to complete the period because he tries to bring back a young girl who has run away before expulsion from an orphanage—the charge being that of meeting the hero clandestinely. Of course, the fortune devolves on the orphan. There are several other characters worth knowing—Soper the valet, Adolphus (a clerk), and an astonishing alderman.

A realistic study of London slum life is Dorothea Slade's *Gutter-Babies* (Houghton, $1.25). Other writers have written of guttersnipes and their relations, notably Arthur Morrison and Neil Lyons, but Miss Slade gets right at the heart of her children. Her skeches, for they are only that, tho the same characters pop up at intervals, are done with a firm hand, but the touch is tender and sympathetic. She knows what she is writing about and does not hesitate to set down in black and white the unconsciously profane talk of those among whom she has chosen her living place. We feel convinced this is the real thing. Miss Slade is fortunate in having for her illustrator Lady Stanley, widow of the explorer.

When a young man of good birth wants to become an honest working man, it seems to be the fashion of authors nowadays to make him a blacksmith. It is a trade about which Borrow has cast a glamor, or was it Scott in *Kenilworth?* Mr. R. Macaulay's blacksmith is Benjie Bunter, son of Lady Lettice Bunter. He is an earnest young man who wishes to remake the world, and he chooses as his fit mate a mill hand. He has lots of other views. So have his relations and hers. To keep things stirring there is a pair of likeable young vagabonds who have no views except that the world is made for enjoyment and laughter. Benjie suffers much disillusionment before sinking to the happy respectability of a semi-detached villa in suburbandom and its conventionalities. *Views and Vagabonds* (Holt, $1.35) is a novel for a quiet hour, and it will win you in spite of an inclination to talkiness.

Given a drunken father and a brilliant mother who is a morphine fiend, what will the children of the union be? Mr. Cosmo Hamilton is all for making our flesh creep, and in *The Outpost of Eternity* (Appleton, $1.25) he gives us full value, for a more extraordinary pair of girls than Harry and Dick it has not befallen us to meet. Both girls skate on very thin ice, with Mrs. Grundy beckoning frantically on the brink. Harry falls in, landing first in the bedroom of her father's guest with the intimation that she has come to stay, goes on the stage, and ends up as a habituée of Maxim's in Paris. Dick also goes on the stage, dallies with many admirers and indulges in joy rides—but that's all. There is a patient lieutenant in the background. At a crucial moment during a flutter with an Indian prince, she is saved by coming across the Bible. On her way back to conventionality she runs over the lieutenant and marries him when he recovers. We hate to say it, but there is going to be trouble in that household.

An amusing, if somewhat slovenly written, account of the tribulations of a young Englishman of many flirtations is *My Escapes* (McBride, Nast, $1.20). Coming into a fortune, a bachelor finds that his former willingness to play tame cat to old ladies, dancing partner to wall-flowers, and bestower of general attentions on the other sex, brings all his women friends around him, each claiming to be his fiancée. To marry the girl he loves he has to set a quick pace to outwit his pursuers, but manages to do it by a final daring diplomatic stroke.

Toll of the Deep Highway

A darkling waste of soundless sea,
A waste of soundless sky;
A coronet of storied light
Sweeping superbly by!

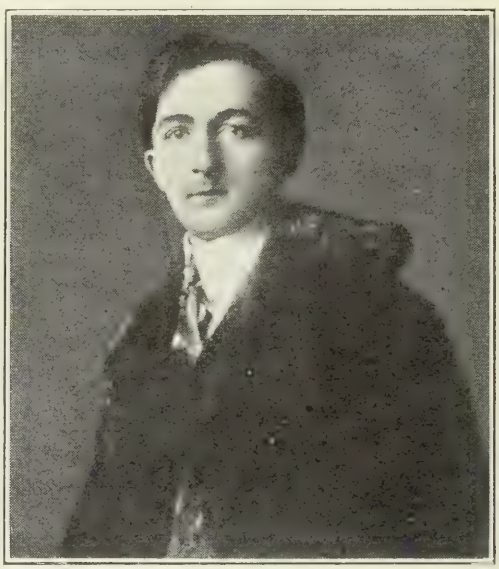
On Monday morning, April 15th of last year, the White Star liner Titanic struck an iceberg, and within two and a half hours had plunged to the bottom of the North Atlantic. At first rumor, then full confirmation of the terrible disaster by rescue; the interruption of wireless service; the nature of the collision, which ripped open several compartments.

Sixteen lifeboats got away half filled and four collapsible boats, one of which upset. On this side some thirty persons found an insecure footing, and amongst them Colonel Archibald Gracie, author of *The Truth About the Titanic* (Kennerley, $1.25). Colonel Gracie was carried down with the sinking ship and came to the surface after it had entirely gone out of sight

FIFTH OFFICER LOWE TOWING THE CANVAS COLLAPSIBLE
From Colonel Gracie's *The Truth About the Titanic* (Kennerley).

which over 1500 lives were lost sent a sickening thrill thruout Europe and America. There have been greater disasters: more lives have been lost in an hour on the battlefield; but it was the unexpectedness, the almost incredible sinking of a vessel proudly vaunted to be unsinkable and the latest triumph of man's mastery over the wind and waves of the devouring seas, that set two continents shuddering and weeping.

The inquiries held in Washington and London established clearly that warning had been given of the presence of ice, but that the captain had kept up full speed ahead. The captain was not wholly to blame, however. There were other considerations: the frenzied desire for speed—a few more hours taken off the crossing; the sacrifice of safety to luxury—space devoted to swimming pools, palm gardens, which might have been given to lifeboats; the failure of a passing liner to come to the —a space of four minutes. How long it took to reach the nether waters no man can estimate, but this mighty riven hulk is now the playground of sea monsters, a garden of waving weeds.



And ever thru the ponderous dusk
Faint memories of motion thrill
And Eternity itself goes wan
In Time so changeless and still.

His experiences make thrilling reading. He was on deck till the last, and saw Colonel Astor, Mr. and Mrs. Straus and others calmly awaiting the end. He has collected from the reports of the inquiries and from personal interviews accounts of the adventures of each individual boat, the names of those in them, and of those left on board who said the last farewell. Reading these, one realizes to the fullest extent the sudden horror of the accident, the trials which followed, and the traits of humanity exhibited by all concerned. Tho

here and there one catches glimpses of selfish savagery, the prevailing impression is that men still know how to die bravely, and that women are no whit behind them in facing death or enduring peril. It was a night of cold and fear—wives torn from husbands; huddled mortals committed to a great adventure—and few were found wanting.

Then the Carpathia hove in sight and the night of terror was at an end, but sorrow endured. Many of those saved were so weakened by their experiences that they succumbed and among them Colonel Gracie, who died toward the end of the year, leaving a few pages of his book still unwritten.

Much has been written in prose and verse on the subject, but few have struck such a high note of tragic sincerity as does H. Rea Woodman in her sequence of short poems, *In Memoriam: The Titanic Disaster* (published by the author, 50 cents), from which we have made quotations.

T. EVERETT HARRE
Author of *The Eternal Maiden.*

The Eternal Maiden

T. Everett Harré has written a novel which is really human and poetic at the same time. Only three or four Americans have been able to write about their own land and people and make their characters live in the mind of the reader, but Harré has taken an unknown people in a land which has always seemed more of a dream than a reality. He has bared their souls and introduced their gods. He calls his story *The Eternal Maiden* (Kennerley, $1.20)—not an impressive title but one full of poetic significance.

Harré is consciously a poet, altho an unfinished one, for instead of writing a preface he has composed a "prelude" to introduce his story and a "finale" to close it. The story proper is an Eskimo love legend which recognizes sex as a beautiful thing and does not attempt to hide it under a cloud of romantic gush.

If Mr. Harré had only chosen a new plot to weave thru his story the work would be noteworthy indeed, but his plot is hackneyed. There is little excuse for its existence. We all know of the beautiful maiden who shows preference for the hero and then casts him off for the handsome stranger, how the stranger proves false, and the true lover, returning, champions the girl and makes the supreme sacrifice for her sake. And that is the plot of the story, only it is set in Greenland instead of civilization, and the villain is a Scandinavian trader.

The author has accomplished a difficult feat; he has written subjectively with effect. He utilizes the mountain, the sea, the wind and, in fact, all the forces of nature, and he has given a new symbolism to the ice and the walrus.

"'Olafaksoah shareth the igloo of Annadoah,' whispered the wind suggestively."

Interspersed with his bits of real poetry Harré gives some really interesting information concerning the snow land and its people. Moreover, the imparting of the information does not mar the story; it visualizes the emotions of Ootah.

The story is, above all things, graphic, so realistic that it haunts you. The writer seemingly understands the people of the North, and loves them. He pictures a primative civilization which has not acquired the institution of property. He shows how the people are not given to bartering and are easily swindled out of their winter's food by those from the South. Right here he could have injected some real fire in his story by portraying the crimes perpetrated in the name of commerce, with such a race. If he had taken this or some other vital question he perhaps could have written a great novel instead of a beautiful idyll. He did not try. But he is young—very young—and perhaps we are as well off with the idyll, anyway.

Mrs. Sedgwick's Stories

All who read Anne Douglas Sedgwick's *Tante,* with keen pleasure—and there were many such—will feel a genuine anticipation in picking up the same author's new volume, this time consisting of short stories. (*The Nest.* The Century Co. $1.50.) Nor will such be disappointed.

For one of the five, "Miss Jones and the Masterpiece," the author deems it advisable to offer a foreword of hinted apology. Yet except for its flat ending, this story—of the

prunes-and-prisms, Art-must-be-moral-to-be-great young woman who all unconsciously poses for a painting which sums up the Manon Lescaut type—has the real ironic tang.

But some of the other stories seem more characteristic of the author of *Tante*. The title story concerns a man whose doctor has told him that he has but a month to live. He goes home to a wife whom he has thought loveless, only to be so smothered in adoring devotion that he begins to long for the end of his month. At last she fathoms his mood, and about the same time he learns that he is to recover after all. Before them both stretch the bleak years. It is a subtle and penetrating study of the elusive halftones of sex attraction—and repulsion.

"The White Pagoda" is in lighter mood, satirizing a sham æsthete who copies a neighbor's methods of interior decoration so whole-heartedly that she half persuades herself that she has been the originator, and is finally caught in her own guile.

"A Forsaken Temple" is a *Tante* in miniature, for it probes and lays bare the heart of a woman who wishes to have another woman's affections all to herself. So great is her morbid jealousy that she stoops even to keeping Milly Quentyn from being reconciled to her own husband for fear there may be the less love for her. It is ruthless exposition of that feminine perversity which can destroy a loved one's happiness merely for the gratification of self.

In her grip on the subtle—and often unconscious—manifestations of feminine egoism, Anne Douglas Sedgwick stands alone among present-day novelists of her sex. And one fact which allies her with Meredith is that she can reveal the most unlovely actions of selfishness with sympathy instead of a sneer. Where so many writers nowadays are concerned with mere surface passions, she penetrates to the hidden sources of selfishness which hoodwinks itself and hypocrisy which is half sincere. She deals with the *nuances* of life rather than its broad brush-work. To real nobility of character she gives quick recognition; to the littlenesses of human nature she makes answer not so much with the scourge as with pitying comprehension.

The Green Devil

The fascination of medieval times, when gay knights rode on daring ventures and human passion refused to be quieted by donjon keep or convent cell, never lessens its hold upon fiction writers and readers. Every phase of that twilight era is charged with mystery and romance, out of which imaginative forms rise almost unbidden. Add to this the fact that no portion of English history is more vibrant with the notes of a stirring new life sounding thru the dusty framework of the past than that which saw the work of Wyclif's poor priests and the spread of Wat Tyler's insurrection, and you have outlined an inviting if not ideal atmosphere in which to lay the plot of an exciting historical novel. Mr. Arthur Metcalf has chosen this doubly interesting period for the background of his *Romance of Thornton Abbey*. It is a winsome story of pure high-minded love, ennobled by sacrifice and contrasted with the cold and cruel ambition of *The Green Devil* (Pilgrim Press, $1.20). The wrongs of the peasants and their fruitless struggle for better things, the greed of the orders, and the turmoil and general confusion of social life are incidentally but impressively depicted in the relating of this uninvolved, romantic and highly entertaining tale.

Literary Notes

Azalea, by Elia W. Peatie (Chicago: Rielly & Britton Co., $1) is a story for girls. It is very simple and fresh, but the reader fears it is too much of a "milk and bread" diet for the vigorous, modern, independent American girl.

Toby, by Credo Harris, is a stirring tale of adventure and love. The scenes are laid in Kentucky and there is a liberal sprinkling of mountain and negro dialects, mint juleps, fine horses, pretty women and brave men. (Small, Maynard, $1.25.)

Princess Mary's Locked Book (Cassell, $1) contains the adventure of her life. She was an Anglo-German princess, and she went to stay with a former governess who had turned Lady Guide to sightseers in London. The princess accompanied her friend; the first client was a prince, and—well, you can guess the rest. A simple, chatty book of the travel-made-easy kind.

A smartly written story of English society, London art life and the suffragist cause is *The Declension of Henry D'Albiac*, by V. Goldie (Stokes, $1.25). A wealthy young French nobleman is in love with a fairy-like society belle till he meets Mrs. Evans, a Scotch girl, who, when she is not painting in her Chelsea studio, loves to harass patient policemen outside the Premier's house. She puts grit into her wooer, but is too much his friend to marry him. Many readers will relish the clever character sketches, satire, snap in dialog and good humored atmosphere of the book.

Virginia W. Johnson has used her Italian travels to write an entertaining

book of fictional episodes. The plots of *A Lift on the Road* (A. S. Barnes) are trifling, yet the characters stand out with such satisfying completeness of detail that we hope one day to see a full length novel from this observant writer.

Pippin, by Evelyn Van Buren, is an amusing story of a sharp little pickpocket who tries to repair the fortunes of an American actress stranded in London, to reform herself for her lover's sake and to play good fairy to all about her. Miss Van Buren introduces several eccentric characters in low, literary and theatrical life, and the book is full of cheerful humor. (Century, $1.30.)

Soon there will be no space left on the map of Europe for those kingdoms unknown to Cook, into which stray Englishmen and Americans take tickets, a princess given away with each one. In *The Little Grey Shoe* (Little, Brown, $1.25). Percy J. Brebner has written a bustling novel. The daring hero, loving a serving maid, is tangled up in revolution, plots and counterplots, and finally comes to his own, for the serving maid was the princess, you see.

Concert Pitch, by Frank Danby (Mrs. Julia Frankau) is the story of a lovely wayward girl, child of a scheming mother, who has the knack of doing the wrong thing on every occasion. Loved by the true-hearted Lord Lyssons, who drowns his sterling merit in a flow of flippant talk, she impulsively marries a brilliant but selfish musical boy. Before things come right she has to pass thru many trials. The vitality of the book, its sustained interest and sheer cleverness, make it a worthy example of the writer's best work. (Macmillan, $1.35.)

Alfred Buchanan, in *The Modern Héloïse* (Dillingham, $1.25), gives us the disjointed dancing of several very dreary dolls. The chief marionette, product of a poetic prizefighter and a penitent Magdalen whose name is sometimes Miranda, sometimes Mirabel, is a student of books, not life. He marries a Puritan, leaves her for a French girl, and winds up with a vague English miss. There are clever touches of dialog, but the final impression is one of a jumble of weakly exprest theories on the right of man and woman to live and love as mutual happiness leads them.

Who Laughs Last (Putnam, $1.35). In this case the one who had most reason for laughing was Billy Winterbourne, who got into a scrape, was sent to the South of France, rescued a charming girl, foiled the schemes of several adventurers, assisted an American millionaire—who speaks a patois foreign to us—was forgiven by his father, saves the family bank from failure, reconciles his father and mother, and makes his half brother see that youth does not always mean folly. Ashton Hilliers has packed his novel full of romance and adventure, with a shrewd eye to the nature lover, the business man, the sentimentalist, and all ages of novel readers.

Cordova, under the benign rule of the Arab caliph Abderrhaman, is the scene of the historical romance, *The Two Gods,* by Walter S. Cramp (Boston: Badger, $1.25). The hero, son of the Christian governor of Merida, after the sack of that city by Christian forces, takes service with the caliph and rises high in his favor. After many experiences, including an embassy to Rome, then swayed by a licentious pope and clergy, he weds the daughter of his tutor and becomes a Moslem. This is a clever piece of work dealing with a period glowing with color.

At first glance *The Seer* (Moffat, Yard, $1.20) promises to be one of those novels in which the note of religion is blatantly and vulgarly sounded for the delectation of hysterical women. As the story proceeds, however, its evident sincerity does not fail to impress. The principal figure is a country preacher who has the gift of healing, with a creed of Be kind, be glad, love God. He heals in spirit and body many who have fallen or are about to fall by the way, founds a community which brings happiness to the dwellers of a sordid manufacturing town, but is killed during a strike. He is a remarkable figure, and those who surround him are humanly interesting. This is a book which grips, in which the author, Perley Moore Sheehan, says something worth reading.

There is something doing every minute in George K. Stiles's first novel, *The Dragoman* (Harper, $1.30). It is a breathless book of adventure served up piping hot, with cutlery of war, music of gunplay, well sauced with gore, lovemaking and grim humor. An Englishman, seeing a young American girl accompanying her father, who is taking a cargo of munitions of war up the Nile, smells a plot, and plunges into the thick of the mischief. He lays the ghost of a Moslem rising and wins the girl. There are accompanying flashes into the troubled depths of Anglo-Egyptian rule and diplomacy, of the brooding horror of the upper Nile, of Mohammedan hopes of a Messiah, and of the innate muddle-thru-at-any-cost force of character which serves the Englishman today as of yore.

Pebbles

D. C. A.—"Which is proper—'Green Old Age' or 'Ripe Old Age'?"

P. B. A.—"Both; but the latter signifies a fruitful career!"—*Jack-O'-Lantern.*

"Tremendous crowd up at our church last night."

Damsel—"Yes, but she's left an affirmative answer in the gramophone."—*Meggendorfer Blätter.*

Friend—"You are wasting your time painting pictures, old chap."

Artist—"But I sell my pictures."

Friend—"That proves what I said. It shows that you could sell anything, so why not take up something there's big money in?"—*Boston Transcript.*

THE SCHOOLBOY'S LIBERATOR.

Mi teecher keeps me after klas
  Bekos I canot spel a wird.
She tels me I can never pas;
  I tel her that is kwite absird.
The old, old way iz out of dait,
  Carnaygy says, and I agre,
And rite in klas I boldly stait
  No stand-pat speling now for me!

Columbus kaim akros the se
  To find this land of korn and whine.
A grate diskuvrer he may be,
  But there's another just as fine.
Carnaygy he diskuvrd how
  The Inglish langwidge shood be spelt
And, grate as Kris's faim iz now,
  It's Andru C. wil ware the belt.

Tho Washingtun is kwite a man
  And Linkun ain't so very smal,
The Laird o' Skibo has them skan;
  He iz the grandest of them al.
The only frend in al the land
  To tender children in the scools,
He took his litl hatchet and
  He simplifide the speling rulz.

Yes, Andru is our leeding one;
  He did a brave and nobel thing.
Like Genrel Georg H. Washingtun,
  He slu the Inglish ov the king.
And more than that did Andru C.
  Like Linkun in the war with Spane.
He set a million childrn fre
  From wairing slavery's gawling chane.

—*Newark Evening News.*

FIFTY YEARS AGO

FROM The Independent, April 30, 1863

Bribery and Corruption at Albany.—The Legislature of 1860, which passed the "Gridiron Railroad" bill, was considered more corrupt than any that had preceded it; but the Legislature which has just closed its session has completely distanced anything ever known in the way of bribery and corruption in any legislative body.

The great bill of the session, and one which was more thoroly steeped in iniquity, both in its conception and passage through the Legislature, than any other, was the Broadway Railroad bill.

We know not how those who voted for that bill can meet their constituents without a blush. . . . Some of our most wealthy and respectable citizens offered to take the same grant, with all its obligations, and give security to build the road, and at the same time pay two millions of dollars, to be appropriated for the benefit of our volunteer soldiers, or to benefit of the city or state. All this was refused, and the franchise has been given for nothing to a set of men most of whom are unknown to the public.

—Boardman Robinson in the New York *Tribune.*

SURVEY of the WORLD

"Rag Babies" to Increase the Corn Crop

The farmers of this country are losing more than half a billion dollars annually on their corn crops. And the worst of it is that this enormous loss could be prevented in such a simple way that to follow it seems almost like child's play. The trouble is that the acres planted are not made to yield as large a crop as they are capable of producing.

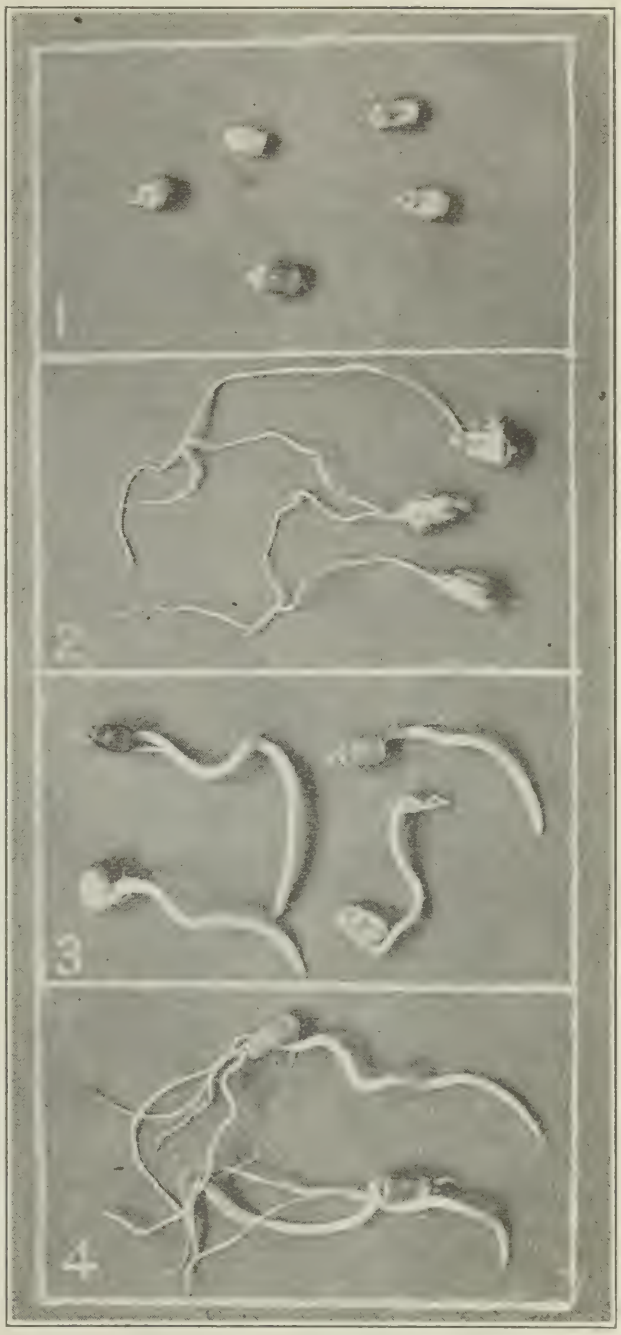
Every acre of land in the United States devoted to the cultivation of corn could and should be made to produce ten bushels more each year. This isn't a theory. It has been proved over and over again in many different localities. There are approximately 114,000,000 such acres. A ten-bushel increase would mean 1,140,000,000 bushels of corn, which at the very conservative price of fifty cents a bushel would have a value of $570,000,000.

How will you get it? Test your seed. How will you get unprogressive farmers to test their seeds? The Crop Improvement Committee of the Council of Grain Exchanges is answering this by teaching the children in country schools the rag baby test. Hundreds of rural schools thruout the nation are taking up the work, and it is estimated that fully half a million children tested seed corn last year. This is having its effect. The farmers are coming to realize the importance and practicability of testing seed corn before planting, and while some of them profess to scoff at the "rag baby" method, they are secretly putting it into practice.

All that is needed to make a rag baby tester is a piece of heavy sheeting about

SECRETARY BALL, OF THE CROP IMPROVEMENT COMMITTEE, EXAMINING THE RESULTS OF SCHOOLBOYS' TEST

five feet long and nine inches wide. This is marked off into as many small squares, about an inch and a half wide, as there are ears of corn to be tested. The usual method is to test twenty ears in each rag baby.



The squares are numbered from 1 to 20, and the ears of corn are given corresponding numbers. Six kernels of corn are then taken from ear number 1 and placed in the square marked 1. In a like manner, six kernels are taken from ear number 2 and put in square number 2, and so on until all of the squares are filled. The cloth is next thoroly moistened by sprinkling, then rolled up, beginning at either end, and a string tied loosely around it to prevent the kernels from being misplaced.

When one or more rag babies have been prepared in this manner, they should be placed in a bucket or pail filled with warm water. After standing in this for three or four hours, the water is drained off and the pail wrapped up in a lot of old newspapers. In a couple of days remove the papers, refill the pail with warm water, allow it to stand for five or ten minutes, and then drain off as before.

At the end of seven or eight days the sprouts will be about two inches long, and it is then an easy matter to tell the good seed from the bad. Where one kernel in a square has not sprouted, or if any of the sprouts look weak or mouldy, it means that the ear corresponding to that square is not safe for planting and should be thrown away. It takes about a dozen ears of corn to plant one acre, but allowance should be made in each rag baby test for six or eight ears which must be discarded.

The rag baby is causing a lot of enthusiasm in the rural schools where it has been introduced. Seed testing contests are being held and suitable prizes awarded to the boys and girls whose tests show the highest average, the men furnishing the seed corn as "partners" of the children. In high schools, too, the testing of seed corn has been introduced. In Mankato, Minnesota, a small space is borrowed in all the show windows in town to exhibit the prize winners from each district.

It is only a question of time, probably, until all of the rural schools will teach at least elementary agriculture. The reason they have not done so before is because the teachers themselves have not had the training. Statistics recently compiled show there are 250,000 rural teachers in the United States. For the rural school to fill its place in the community, a course of study coordinated with rural life is needed, together with a corps of teachers trained to put into operation work that the country districts need.

AFTER THE RAG BABY HAS DONE ITS WORK

Ear No. 1 was dead; No. 2, weak, developing roots only; No. 3, weak, with sprouts only; No. 4, strong, with both roots and sprouts.

Can an Angleworm Learn?

The education of an earthworm is the latest attempt of the psychologists, as represented by Prof. R. M. Yerkes, of Harvard, to see what can be done in animal training. He constructed a T-shaped "maze" of glass with one end closed by sandpaper, and put just beyond it a pair of electrodes. The other arm was left open, and led to an artificial burrow. The worm was placed near the stem of the T, which pointed to-

ward the light, and the light drove the worm to enter it in search of a dark retreat.

This test was made five times a day, and after several months Professor Yerkes thought the worm made the right turn more often and more quickly than the wrong one which led it to the sharp sandpaper and the slight electric shock, thus showing ability to acquire a new habit. Then he cut off the five anterior segments which contained the creature's "brain," whereupon the rest of the worm soon began to pursue its natural life as before, burrowing in earthy manure, etc. As new foreparts began to grow (regenerate) greater activity and initiative were noticeable, until finally the regeneration was complete; but then the worm had forgotten all its required learning and had to begin over again. The principal thing taught by these experiments, apparently, is that you can't really improve a stupid pupil by cutting off its head!

The Vanishing Sleuth

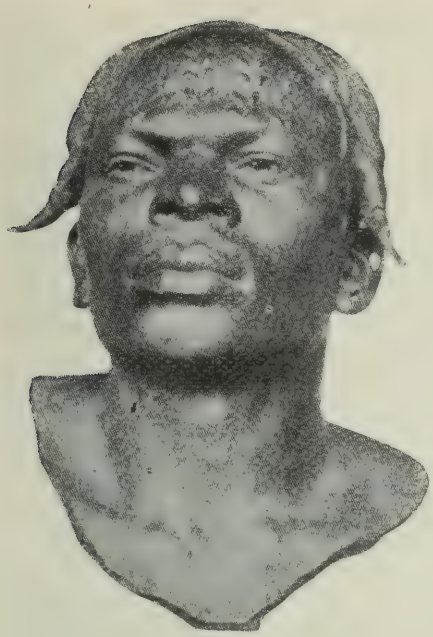
The official detective attached to the Police Department is passing out of existence. At present he is retained as a sort of bogey man to inspire awe among the uninitiated. The real work of apprehending confidence men, wire-tappers and check raisers is passing into the hands of uniformed patrolmen and detective agencies.

Statistics collected by the Federal Government bear out the conclusion that the man of forty disguises exists only as a figure head. Nineteen cities of the second magnitude have from twenty to twenty-five sleuths. St. Louis, with more than 700,000 population, has twenty-five detectives, and Indianapolis, with scarcely more than a third of that population, has the same number.

Of the nineteen cities investigated by the Government, Pittsburgh heads the list. In that city there are thirty-three men who continually carry a change of mustaches in their pockets. New York and Chicago have recognized the inability of the detective to cope with the law-breaker and have abolished the line-up and sent their detectives to various precincts, thus practically making them patrolmen.

While the number of detectives in the nineteen cities does not vary much, the number of patrolmen per mile and per thousand population covers a wide range. If the cost were evenly distributed every man, woman and child in San Francisco would have to pay $3.48 a year for "police protection," but in New Orleans, with a slightly smaller population, the per capita cost is only $1.19.

Cleveland, with its "model system," has one patrolman for every thousand persons; in St. Louis there are two for every thousand, and in Washington still more. This does not put Washington in the wicked city class, however, for the chief duty of the capital policeman is to keep visitors off the grass and stop pedestrians from running in front of street cars. Consequently the street railway company pays a large part of the police budget. Twenty detectives look after all the real dyed-in-the-wool bad men that come to town. In New Orleans there is one roundsman for every five hundred acres of city and every thirteen hundred inhabitants.

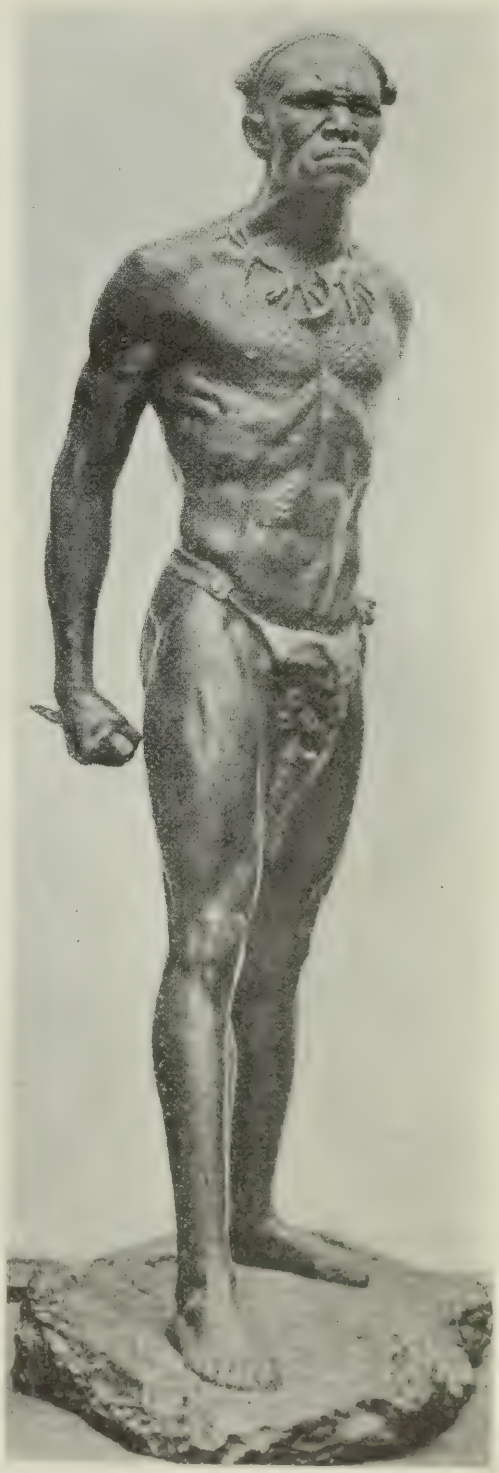


The Soul of the Black

Sculptors have often been men of adventurous life, and thus there is nothing surprising in the fact that Herbert Ward, the British sculptor, has been a globe-trotter

THE TRIBAL CHIEF

"Ward's statues live," writes a French critic, "with an extraordinary interior life. One reads in them will, recollection, meditation."



AN ARUIMI MAIDEN

from the age of fifteen. New Zealand, Australia, Borneo, are among the exotic fields he traveled at that early age; later he was to share in the African expeditions of Stanley. It was thru these last experiences that he learned something, not only of the negro nationalities and languages, but of the negro soul.

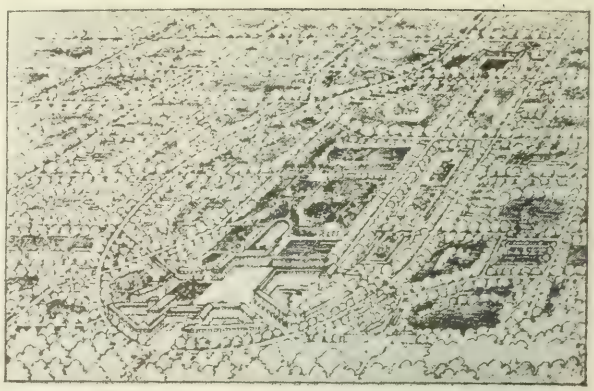
A part of Herbert Ward's African experience is narrated in his book, *Chez les Cannibales de l'Afrique Centrale*, but more perhaps, is exprest in his sculptures. Francis de Miomandre describes in *l'Art et les Artistes* his visits to the sculptor's studio in Paris; a studio lighted with a diffuse and somber light, of a shade indefinably greenish, evoking for the interviewer the deep forests of the dark continent, wherein teems a multitudinous life. But what a studio! War-drums and gongs of the Kongo utter their disturbing notes; a forest of lances, steel tipped; bows and arrows; daggers curved and straight—every variety of instrument of death—about 7000 of them. The people of the forest have carried one art, at least, the art of forming and chiselling and decorating their knives, to a high pitch. The visitor who calls on Herbert Ward is transported thousands of miles from the area of furnished apartments.

But it is Mr. Ward's bronzes that most impress the visitor to his studio. The bronze figures and heads that one finds there are of the Kongolese forests; men of strong necks, short legs, unembarrassed stare. Simplicity is the distinguishing characteristic, we generalize, and then we happen upon the "Savage Lighting a Fire," and ask ourselves if the primordial attitude into which the figure is frozen does not symbolize the Promethean discovery. The "Kongolese Group" (a mother and two children) is a study of black maternity, and the maternal instinct; the "Native Artist," the "Kongolese Warrior," the "Tribal Chief," depict other types, almost as simple, almost as universal. The "Chief" on his barbarian throne, set upon a pedestal of sculptured idols, is an image of unquestioned authority. All of this work represents the type, yet not that abstraction which is art unrelated to the individual. The beauty of some of the models who have served Mr. Ward is scarcely less striking than the sculptor's appreciation of that beauty, celebrated in literature now and again by a Baudelaire, but seldom if ever in modelling; altho at least one contribution to the recent Exhibition of International Art in New York City was a Black Venus sculptured. Indeed the Bankoudou and Bangala, little people of the great forest, well known to Mr. Ward and intermediate between the natives of the coast and the interior, offer an individual type of perfect form. Their long necks, straight limbs, broad shoulders, muscular throats, suggest, in almost all but face and color, the Greek type itself.

DEFIANCE
A Kongolese warrior in bronze.

Radium and Plant Life

Experiments conducted independently of one another in various quarters have, it is thought, demonstrated that the rays of radium constitute a stimulus to plants. From the assumption that radio-activity is universally present in soil, water, rain and snow, the conclusion is drawn that living matter can hardly escape its influence. It has been shown that a plant can be educated to endure an intensity of stimulus of this kind which at first retards its growth.



Freshly fallen rain may have sufficient radio-activity to retard the growth of plant organs, and so with tap-water which has previously been exposed to the emanations of radium. Some of the experiments indicate the possibility that mutations may be induced by the effects of radio-activity.

A Model Village in a City

City-planning schemes which involve the remaking of scores of long-built blocks are no rarity, but the City Club of Chicago has taken the novel step of holding a competition for the best layout of an unoccupied quarter section of land on the outskirts of the city. Chicago has its larger plan, which will require years of development, but the club felt that the rapid extension of the improved residence area should be guided especially. A program was prepared for a competition intended to bring out "the essentials of good housing, the best method of subdivision of residential land, the best disposition of space for parks and recreation centers, the most convenient location of stores and of public or semi-public grounds and buildings," etc.

Thirty-nine sets of plans were submitted in competition. The first prize of $300 went to Mr. Wilhelm Bernhard, a Chicago architect; other awards were made to Mr. Arthur S. Comey, of Cambridge, Mass., and Mr. Albert Lilienberg, of the City Planning Department of Gothenberg, Sweden, and his wife.

One of the jury considered that a tract developed according to the first prize plan would have "all the charm of a medieval city, combined with the practical benefits of modern systematic planning." It provides for 1380 families—152 of them in flats, and assigns to their use two schools, seven churches, one lodge hall, a clubhouse—library, a municipal building and concert hall, as well as parks, playgrounds, workshops and a gymnasium. In other words, the quarter section is to be—so far as local needs are concerned—a self-contained, well-centered community, a village in a city. Surface cars and an elevated railroad on three sides gives adequate communication with the rest of Chicago.

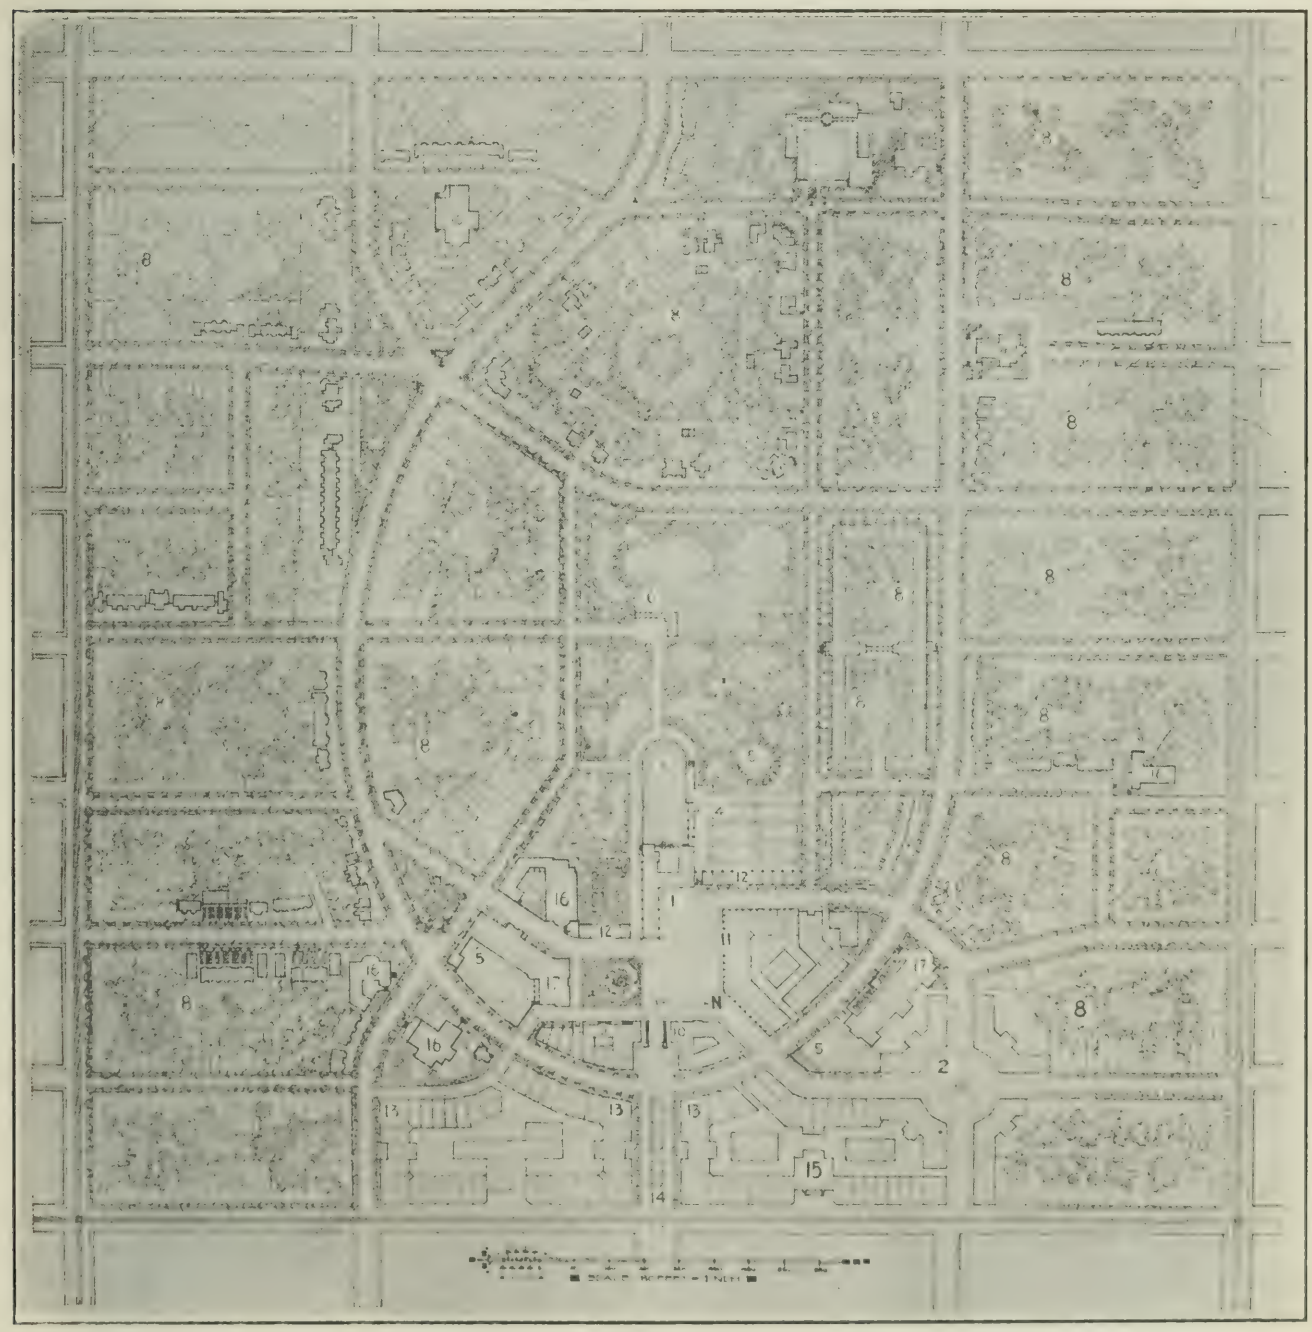
BIRDSEYE VIEW OF THE SECTION
Looking west. The village square, with the children's pool just beyond, is in the foreground.

A great arch, with shops and flats above it, gives entrance to the village square, where the public life of the section will center. Municipal buildings on the east, shops on the north, with an arcade, clubhouse and library facing the parks on the west, will surround an open garden with a monument. Just beyond are the market piazza, two blocks of shops, a schoolhouse, churches and other semi-public buildings.

Around the large park and playground area in the center of the section the more pretentious homes are to be placed, with the streets of smaller house lots running out to the boundary avenues. Every block large enough is to have its private park.

By grouping business around the square the architect hopes to separate distinctly the residence and mercantile parts of the section. He has curved his streets for two reasons: to avoid monotonous rectangles and to discourage thru traffic. All the streets are to be bordered on both sides by six feet of turf, with trees and shrubbery, and the main roads are to be sixty feet wide.

The children are well taken care of in Mr. Bernhard's plan. A large pool lies just beyond the village square; the private parks —glorified backyards—give plenty of playspace even without the special playgrounds, and in addition there are children's workshops and a kindergarten-gymnasium.



All that remains to create this very modern medieval community is for some enterprising real estate operator to follow the scheme in his next development. For his guidance and for the enlightenment of the public, all the plans are on view at a Housing Exhibition at the City Club which will remain open until June 15.

City-planning is contagious—and very good fun, whether you are an architect, a chamber of commerce, or a mere householder with a knack for making diagrams.

The most ambitious project which the movement has developed is that of Hendrik C. Andersen, an American sculptor, who lives most of the time in Rome, Italy, and is intensely interested in the establishment of a model International City. After working on the problem for the last nine years with the assistance of some forty architects, engineers and artists, he is now about to publish a volume de luxe on the subject entitled *Creation of a World-Center*, which will be presented to all the heads of the nations of the world, as well as to the chief libraries and universities.

Old Manila's Gates

Perhaps there is no form of medieval architecture so interesting in Manila as the gates leading from new Manila into the Walled City. Much of the colossal wall surrounding this ancient city has been torn

FIRST PRIZE PLAN FOR A QUARTER-SECTION ON THE FRINGE OF A BIG CITY

1—The village square
2—The market piazza
3—Children's pool
4—Tennis courts
5—Children's public grounds
6—Recreation parks
7—Playground and band stand
8—Private parks
9—Municipal buildings
10—Restaurant, shops (flats above)
11—Arcade for shops
12—Library and club-rooms
13—Two blocks of shops
14—Elevated station
15—Nickel theater building
16—Church buildings
17—Public school buildings
18—Children's workshops
19—Kindergarten and gymnasium

down by our government to meet the ideas of modern municipal engineering, but many of the historic gates still stand today as they have stood for centuries.

The walls are from twenty to thirty feet thru, and at either side of the passageway the gates are small rooms where guardsmen were quartered in feudal times to keep watch over the entrances. Once a moat circled the walls, making necessary bridges leading from the outside up to the arched

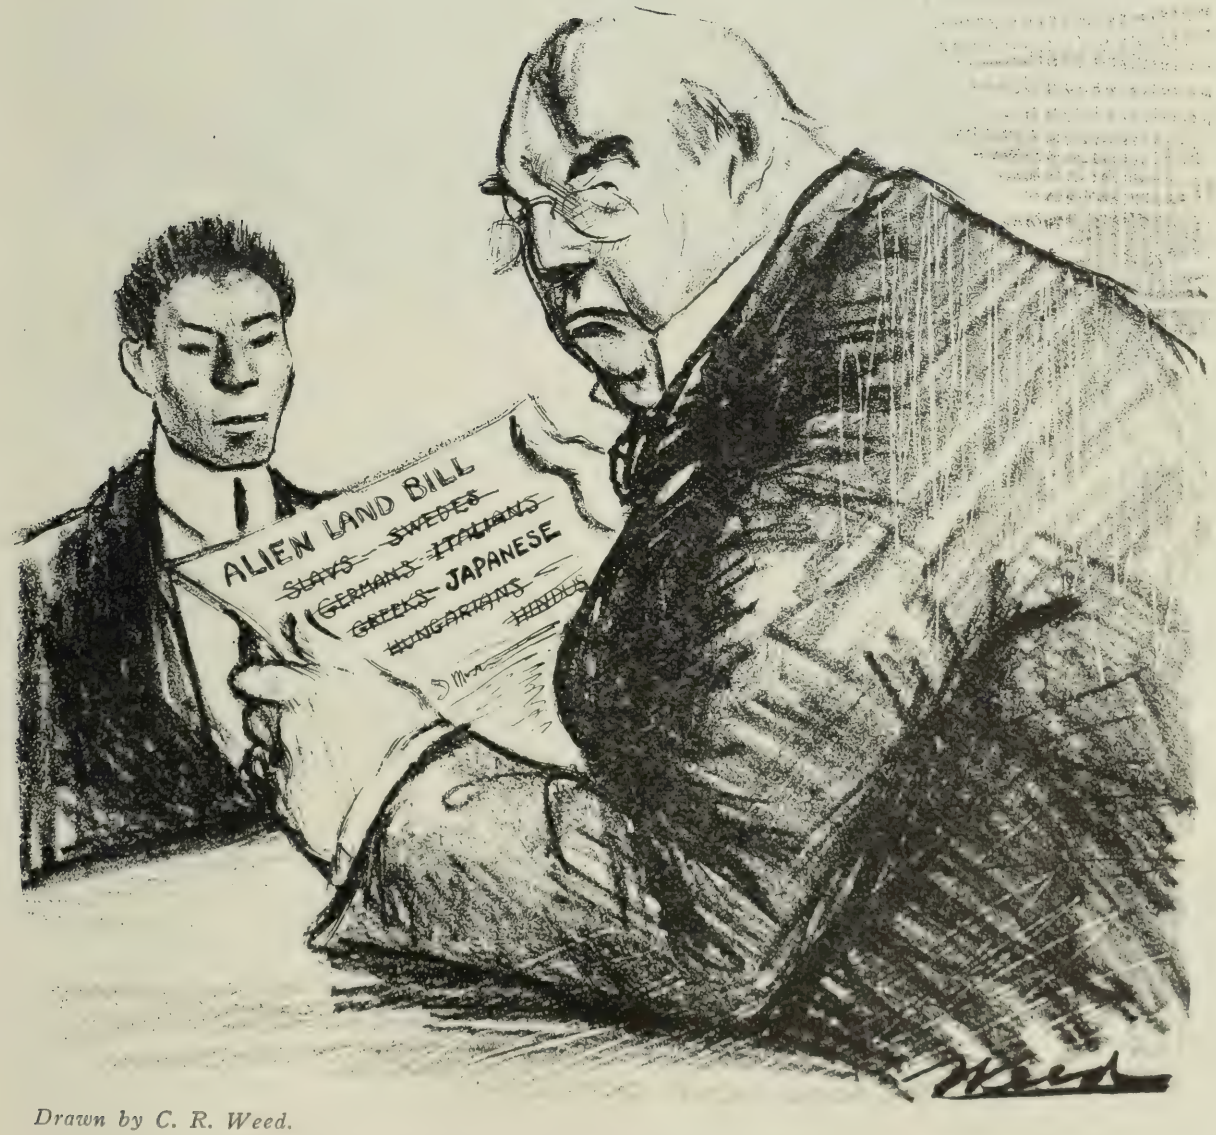
THE OLD GATE OF SANTA LUCIA, MANILA

entrance. These bridges were of the draw type, and were swung on the heavy chains, so that when an enemy approached the passageways could be closed to traffic. As the gates are narrow, vehicles must pass thru into the Walled City in single column, a requirement that frequently congests traffic. The recklessness of Filipino cabmen, as well as the crumbling nature of the sandstone masonry, is evidenced at the gates by niches worn out on either side of the arches by vehicle hubs brushing against them. The gates are all named after patron saints of the church, or for distinguished Spaniards.

Guarding Milk

The authorities in Munich, where, as in most European towns, milk is largely supplied by itinerant peddlers, now require an improved form of cart-can which prevents adulteration in the can, keeps the cream from rising to the surface when the milk stands for some time, and avoids contamination when it is poured out. To each can is attached a strong, officially graduated glass for measuring out the milk. The buyer's jug is placed under this on a moving plate which, between calls, is pressed by a spring up against the measuring-glass; therefore before a jug can be placed upon it it must be pressed downward. This is effected by a lever connected with a stirrer inside the can, by which the milk is thoroly mixt before any of it may be withdrawn. The plate with the jug upon it is then pushed upward by the spring against a second plate on the bottom of the measuring-glass, in the middle of which is a valve for letting out the milk in any desired quantity without exposure to the air or any more or less soiled dipper. It would seem as tho a similar device might and should be adapted to the methods of selling milk from open cans, as is customary in this country in small groceries, at lunch-counters and elsewhere, to the great advantage not only of the health of the customer but of the pocket of the dealer in the saving of waste from dripping, more rapid souring or theft.

The "Cold Light" of the Firefly



If light could be produced without heat, the real expenditure would be insignificant, and abundance of light could be generated at a very small cost.

In arc lamps, at the best, barely ten per cent of the power used appears in the form of luminous rays of light. Less than one per cent of the energy value of oil or gas goes to light production in flame lights. In both cases light is only an incident of burning fuel for heat.

The problem of cold light has engaged the attention of some of the brightest minds of the present day. Some have tried to use the light of vacuum tubes excited by electric discharges; some have endeavored to obtain strong fluorescence or phosphorescence in certain substances by electricity, and others have sought to discover how the light is generated in the firefly, and to imitate the process; but without success.

It has been shown by an analysis of firefly light that it is remarkably cold, or free from heat rays. It is produced, therefore, with the highest economy, and represents little energy. To accomplish that result by the same or other means is the problem.

Perhaps the solution will come thru chemistry. It is believed that the firefly secretes a peculiar substance, which, when oxidized by the air, is consumed, giving out only luminous rays. The time may come when this substance can be made artificially.

CALIFORNIA LEGISLATOR: "I guess *I* know what an Alien is!"

Little Brother

By May Preston Slosson

Playing in the city street,
  Little Brother!
Running errands with swift feet;
Passing me with footsteps fleet;
Ought we not to know each other—
  Little Brother?

Care comes early at our call—
  Little Brother;
Far too heavy burdens fall
On your shoulders slight and small.
Would that I could lift them all,
  Little Brother!

In the world's relentless mart,
  Little Brother,
Each must bear his manly part,
Earn his bread with toil and smart,
—But *your* courage breaks my heart
  Little Brother!

Surely there are, unconfest,
  (Little Brother)
Longings in your boyish breast?
Teach me how to help you best—
How we each may help the other—
  Little Brother!

THE WEEK

Japan and California

In Japan, at the beginning of last week, hostile public sentiment concerning the legislation proposed in California was mollified by reports as to the efforts of President Wilson and Secretary Byran. American missionaries were criticised because of their alleged unwillingness to assist the Japanese. Two or three days later, however, the missionaries held a meeting and adopted resolutions deploring the possibility of the passage of a discriminatory bill. There were reports from California that the pending bill would be dropt. But it soon became known that bills for even a more drastic law were to be offered, and that a majority in the Legislature were determined to prevent all aliens ineligible to citizenship from holding land. Governor Johnson published a long statement in which he spoke of California's right to legislate on the subject and pointed to laws by which Washington, Illinois, Oregon, Arizona and other states had imposed similar restrictions upon those who could not become citizens. In a message to the President, however, he exprest a desire that nothing should be done to embarrass the national Government or to offend any other country.

The President's message to the Governor and the Legislature was published. He urged that discrimination be avoided. If the people and the Legislature, he said, deemed it "necessary to exclude all aliens who had not declared their intentions to become citizens from the privilege of land ownership," they could "do so along lines already followed in the laws of many states," but there should be no "insidious discrimination." On the 23d he directed Secretary Bryan to go to Sacramento and co-operate with the Governor and the Legislature in framing a law not in conflict with the treaties. The Legislature adopted a resolution welcoming him. It became known that leaders in the Legislature were preparing a new bill more severe than the one pending, and that the Governor and the Progressive majority would insist upon excluding all who cannot become citizens. It was said that partisan politics and personal political ambition were affecting the question. At the end of the week it was predicted that those controlling legislation would hear Mr. Bryan and then pass the bill.

The subject was considered at a meeting of the executive committee of the Japan Society in New York. There was a unanimous vote in favor of supporting President Wilson, to whom a message to that effect was sent. The president of the society has received telegrams and letters from many prominent persons. Ex-President Eliot, of Harvard, said the bill was the result of local selfishness, combined with ignorance of the Japanese people. Jacob H. Schiff said, in a cablegram, that no country could long ignore with immunity its treaty obligations and predicted that the American people's sense of righteousness would not permit them to be ignored in this case. Andrew Carnegie said the President was only doing his duty in reminding California of the treaties which the states are bound to regard as the supreme law.

Attacking the Canal Treaties

In the Senate, last week, Mr. Chamberlain, of Oregon, introduced a resolution providing for abrogation of the Clayton-Bulwer and Hay-Pauncefote treaties with Great Britain, relating to the interoceanic canal. It was accompanied by a long preamble, setting forth the opinions heretofore exprest by Senator Chamberlain concerning the treaties, our exemption of our coastwise shipping from payment of tolls, and the British protest, which, he asserts, was suggested by the Canadian Pacific Railway Company with the aid of transcontinental roads in the United States. The controversy can most easily be settled, in his opinion, by the abrogation which he proposes. Abrogation requires an affirmative vote by Senate and House, with approval by the President.

At the State Department it is said that neither of these treaties can be abrogated without the consent of Great Britain. Mr. O'Gorman, who supports the resolution, says a majority of the Senate will vote for it. He predicts the adoption of it in the Senate and in the House. Among those who have spoken in favor of it are Senators

Bristow, Kenyon and Cummins. It is said to be opposed by a majority of the Committee on Foreign Relations, to which it was referred.

Representative Rainey, of Illinois, has introduced in the House a resolution for the appointment of a committee to investigate concerning "the taking of Panama" when Mr. Roosevelt was President. In his opinion the results of such an inquiry would induce Congress to make reparation to Colombia or to promote a settlement of the dispute by arbitration.

Orders have been given that no licenses for the sale of intoxicating liquor in the Panama Canal Zone shall be granted after July 1. There are now thirty-five drinking saloons in the zone towns.

The Tariff Bills

The Underwood tariff bill was sent to the House by the Ways and Means Committee on the 22d with a long report explaining and defending its provisions. There was also a report from the Republican minority of the committee deploring the proposed "reversal of an economic policy" which had been in force "for fifty years" and criticising the changes for which the majority of the House are soon to vote. General debate was limited to five days, and the Democratic leaders hope to send the bill to the Senate by May 15.

One of the speeches was made by Representative Hull, the author of the income tax sections of the measure, who defended the imposition of such a tax. His remarks were accompanied by estimates to which we refer in another part of this issue. The Progressives attacked the bill, saying it would be injurious to many industries. They urged that a tariff commission should be appointed.

Award to the Railroad Firemen

The arbitration commissioners appointed to consider the demands of the 31,000 firemen employed on fifty-four railroads east of the Mississippi and north of the Ohio made their award on the 23d, granting wage increases which are estimated to be between $2,500,000 and $4,500,000 and probably are in the neighborhood of $3,000,000. The commissioners were Ex-Judge William L. Chambers, of Washington; Vice-President W. W. Atterbury, of the Pennsylvania road, and Vice-President Albert Phillips, of the Brotherhood of Locomotive Enginemen. The firemen's demands were presented in July last, while the case of the engineers was pending. The award to the engineers amounted to a wage increase of about $3,000,000. Mediation failed in the controversy with the firemen and 96 per cent of the men voted for a strike. Judge Knapp, of the Commerce Court, and G. W. W. Hangar, Acting Commissioner of Labor, procured an agreement for arbitration. Messrs. Atterbury and Phillips were unable to agree as to a third member, and Judge Chambers was appointed by Judge Knapp and Commissioner Hangar. The men estimated the increase called for by them at 15 per cent. The companies said it would be 35 per cent, and would amount to $10,000,000. A part of the award provides for a standardizing of wages on the basis of the weight of locomotives in pounds on the drivers.

Before this decision was announced, the 100,000 trainmen and conductors employed on the same roads appointed a committee of 100 and this committee prepared a long list of demands for wage increases and an improvement of work conditions. The wage increase amounts to about 15 per cent.

The Condition of Mexico

Mexico's Congress refused to provide for a general election on July 27, altho Huerta had promised to exert his influence in favor of the selection of that early date. General Felix Diaz promptly withdrew his acceptance of a nomination for the presidency, and Secretary Señor de la Barra took similar action concerning second place on the ticket. Many thought the two men were convinced that Huerta had deceived them and had secretly opposed an early election, desiring to remain in office. There were reports that Diaz would attack Huerta with a force of 6000 men, but peace was maintained in the capital. Garcia Granados, Secretary of the Interior, resigned. Ill health was the cause given, but many thought he had found he could not support Huerta's government.

Huerta was still in great need of money. A report was published that with the aid of Lord Cowdray (Sir Weetman Pearson) a loan of $7,500,000, at 88½ and 5 per cent had been obtained from Coutts's Bank in London, but officers of the bank denied this. Congress voted an export tax of 10 per cent on gold. The downfall of Huerta was predicted. Trade was paralyzed, railroads were idle and the mails were not carried. Some feared that American residents would be attacked, owing to articles in the newspapers predicting intervention and denouncing the Washington Government for withholding recognition.

In the north the rebels were still gain-

ing, but Guaymas was not captured. An American cruiser in the harbor had boats ready for American refugees. General Aubert, in Nuevo Leon, was surrounded. Rebels, aided by revolting rurales, were taking towns in Tamaulipas. In Sonora the rebels were demanding large sums from foreign owners of ranches and mines, and the confiscation of factories which had been closed was demanded. A mob of idle employees drove from Cananea the manager of the mining plant there. In the South Zapata captured and put to death General Aguilar, a Federal commander, and all the members of his staff. There was a report that Felix Diaz was plotting with Zapata against Huerta.

Secretary de la Barra asked our Government to explain why the American consul at Vera Cruz, W. W. Canada, prevented the removal of Dr. Francisco Gomez from a Ward line steamship when Huerta's men attempted to arrest him. Dr. Gomez recently arrived in Washington. In our Senate, Mr. Smith, of Arizona, introduced a resolution, which was adopted, calling for a report as to damages suffered by Americans in Mexico, the claims presented by them, and Mexico's action with respect to these claims.

Cuba

Cuba's Congress, in joint session, has ratified and proclaimed the election of General Menocal and Señor Varona, president and vice-president, and this is regarded as evidence that protest will no longer be made by the defeated Liberals. General Menocal, who will be inaugurated on May 20, has selected the members of his Cabinet. The complaints and threats of Governor Asbert's followers (who deserted the Liberal party to support Menocal) appear to have had some weight, for two of the new Cabinet officers are Asbertistas.

A new amnesty bill has been introduced in Congress, to take the place of the one to which our Government objected and which President Gomez reluctantly vetoed. This second bill will release only those who were imprisoned on account of the recent negro insurrection, and a few other political offenders. There are signs of unrest at the eastern end of the island, and the Government has urged the authorities at Santiago to watch for the landing of arms.

The Philippine Islands

The Moros recently became excited and belligerent because agitators from Luzon assured them that our Government would compel them to give up the Mohammedan religion. They prepared to besiege Jolo, and the commander of the American troops in the Philippines feared that a hard campaign was at hand. Major Finley was sent to Constantinople, where he asked the Sultan of Turkey to exert his influence in quieting the Moros by assuring them that they had been misinformed. It was announced last week that he had been successful and that he was about to return, bearing a message from the Sultan. In the meantime, however, the Moros had dispersed, having learned in some other way, it is said, that they had been misled.

Since January 1 there have been five fatal cases of bubonic plague in Manila. The health authorities recently employed fifty rat-catchers, in addition to those already at work. A search for lepers has been made in the Moro country. It is now believed that all the lepers in the archipelago, except a few who escaped from the medical authorities, have been placed on the leper island of Culion or are undergoing special treatment at a hospital in Manila.

The Belgian Strikers' Victory

The Belgian suffrage strike of 500,000 laborers terminated on April 24, when 1000 delegates to the National Socialist Congress at Brussels declared for a resumption of work by a three to one vote. The decision was made after a ten days' strike. The Government had been obliged to recognize the power of the general strike, in spite of condemning its principle. The Conservative Premier, M. de Broqueville, told the Chamber of Deputies on the 22d that his ministry accepted a resolution offered by M. Masson, the Liberal leader, for a compromise on the question of an equal suffrage. The General Strike Committee thereupon voted a resolution affirming that the general strike had impressively demonstrated the strength and solidarity of the laboring class, besides advancing the cause of the "one man, one vote" principle.

This is the first occasion on record in which a political strike here resulted in so great a victory for the strikers. The demonstration has been remarkable, also, for the determination, energy, and control shown by the leaders, and the good order of the men. For six months beforehand, the workers had been treated to lectures on economy. The consumption of alcohol fell 50 per cent during that time, and luxuries were eschewed by the men who were preparing for the politico-industrial battle.

For a study of the significance of the strike our readers are referred to the next issue of THE INDEPENDENT, to which Dr. J. Salwyn Schapiro will contribute an article on the subject.

Germany's Military Scandal

Herr Hughenberg, chairman of the Krupp Company's board of directors, says that if the company's Berlin agent bribed members of the War Office in order to gain information about armament contracts he did so with his own money, and without the knowledge of the Krupps. The Reichstag is about to adjourn until May 26, by which time the armament scandal will have been forgotten, the Government hopes.

On April 22 the Budget Committee of the German Reichstag adopted a resolution introduced by members of the Center calling for the appointment of a committee of members of the Reichstag, and of experts, to examine into the whole subject of army and navy contracts. This resolution followed the charges of Dr. Liebnecht that the Krupps and the Waffen und Munitionsfabrik have been corruptly influencing public opinion on both sides of the frontier with a view to selling their war materials. The Budget Committee rejected, however, the amendment offered by Socialists enabling the new committee to call witnesses to examine them under oath. The Reichstag has taken effective means of showing its opposition to General von Heeringen, the Minister of War, who has lost prestige thru the Krupp revelations. Certain items of the military estimates have been denied by a vote of all parties except the Conservatives. General von Heeringen is opposed by the Centrists as well as by the Socialists. The Centrists are hostile because a Catholic army officer who refused to fight a duel, on religious grounds, was dismissed from the service. Allegations of graft in connection with purchases of land by the War Office are published by the *Morgen Post.* The Socialists have planned a great May-day demonstration against the army bill and in favor of reforms in Prussia's electoral system.

The government of the provinces of Alsace-Lorraine was censured on the night of April 22 by the Second Chamber of the Provincial Diet for instructing its representatives in the Federal Council of the German Empire to vote for the military bills increasing the German army. The members of the Diet, by a vote of 47 to 5, declared that the increase of the army was contrary to the wishes of the population of Alsace-Lorraine.

The German jingo press is indignant that official pressure has been brought to bear upon Anton von Werner, president of the Royal Academy of Art, not to display his paintings of the Franco-Prussian War at the coming Kaiser jubilee exhibition. The authorities wish to avoid giving affront to France by the showing of such pictures at a time when popular sentiment is so heated as it is today.

Another German Invasion of France

On April 22 a German army biplane alighted north of Arracourt, two miles from the frontier. Two German officers in uniform stepped from the machine. The local police and officers of the French custom house listened to the explanation of Captain von Devall, chief of aviation inspection at Darmstadt, to the effect that his gasolene had given out, and that he had thought all the time he was still over German soil. The French authorities communicated with the French Minister of War, who, after receiving a full report, ordered the release and return of the aeroplane.

In the meantime the French Foreign Office directed Jules Cambon, French Ambassador at Berlin, to call the German Government's attention to the repeated landings of German military aircraft in France. The Germans are invited to take measures to avoid the recurrence of these incidents, and to consult with France on drafting rules for settling future happenings of the kind. On the twenty-fifth German military officers were notified by the War Office that they are forbidden to participate in future in private flights or competitions involving the possibility of crossing a foreign frontier.

Arracourt, the scene of the latest German air-fiasco, is only twelve miles from Lunéville, the scene of the opéra bouffe descent of Germany's military Zeppelin. The little town of Arracourt figured in the world's news a few months ago when the authorities misread a cipher message and mobilized the troops of the neighborhood. The mistaken orders were obeyed with such cheerfulness and despatch that the newspapers of Paris declared the person responsible for the blunder deserved a decoration for having demonstrated so handsomely France's preparedness.

European Finances

The deficit in the French budget for 1913 will be $40,000,000 and in 1914 a loan of $200,000,000 will be demanded to meet military and naval requirements. This, at least, is the assertion of Senator Emile Aimond, who has been appointed to draw up the report of the budget committee.

On April 25 it was announced at Berlin that the gold reserve of the Imperial Bank had reached a record-breaking total of $250,000,000. The institution has made extraordinary efforts to augment its re-

serve on account of the forecasted increase of the German war chest—to be raised from $30,000,000 to $90,000,000.

Lloyd-George's English budget offers the prospect of a deficit of $37,500,000, which the Chancellor's optimism assumes will be met thru increased revenues and a most prosperous trade year.

Defiant Montenegro Takes Scutari

The Montenegrin forces entered Scutari, besieged since October, on April 22, at midnight. The Turkish garrison was permitted to march out with its arms. Most of Scutari is in ruins. Its population is about 27,000 Mohammedans and 8000 Christians.

The city's fall followed a two days' assault, renewed in the face of the Powers' protest. Tho the Servian allies did not participate in the final attack, their artillery was used by the Montenegrin gunners. The besiegers are said to have lost 3000 killed since October, and the Turks about 5000. The city has been in the hands of the latter since 1477.

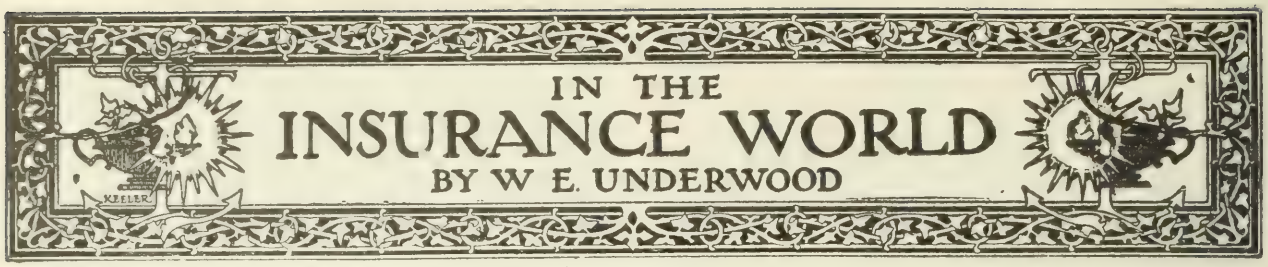
The taking of Scutari in the face of the Powers forbidding Montenegro to continue the attempt gravely complicated the European situation. Austria-Hungary declared in a circular note that combined action must be taken to turn the Montenegrins out of their newly-taken city—or she would do it unaided. In reply the King of Montenegro said he would yield only to force. The case was complicated by the sympathy of the Russian population with the Montenegrins, and the effervescence of Pan-Slavic sentiment in Russia and among Austria's Slav peoples. A peaceful solution was promised, however, when Crown-Prince Danilo of Montenegro and his troops marched out of the city on the 28th, leaving behind King Nicholas and five batteries of Montenegrin artillery, which were, however, expected to follow.

It is asserted that the surrender of Scutari followed secret negotiations between King Nicholas and the Turkish commander, Essad Pasha, who belongs to a great Albanian family and is a candidate for the kingship of the new state. Essad Pasha commands a considerable army, and it is believed that he will be joined by Djavid Pasha with his ten thousand men. Servia favors the bargain, it is said.

China's Loan Signed

The Chinese Government asked Christians the world over to invoke divine aid for the solution of problems before the young republic. April 27 was the date fixed upon as the day of prayer.

That day will, however, be remembered for an event as well as for supplications. The Six-Power loan, become the Five-Power loan by the withdrawal of the United States, was signed just before daybreak. But this action was not approved by a delegation from the Chinese Senate and House of Representatives, which gathered outside the British Bank, where the representatives of the executive power and of the Five-Power group were meeting. The Vice-President of the Senate acted as spokesman for the delegation, and, when admitted to conference with the signatories, he explained that the majority in the Parliament considered the loan illegal.



Since the days of the monarchy the question of a loan has been discussed in various forms, and it threatens now to bring about another revolution similar to that caused by the Hu-Kuang loan.

The situation is about as follows: The Five-Power bankers and the Chinese Government have arranged the loan of $125,000,000 practically for Yuan Shi-kai's Cabinet, which Yuan Shi-kai completely dominates. The Cabinet contends that the Government has a right to conclude such a contract because the permanent Assembly has not yet been constituted, and therefore approval of the Six-Power loan by the Provisional Assembly holds good. In addition to the withdrawal of the United States from the combination, however, other alterations have been made in the contract since the Assembly approved it.

The Kwo Ming Tang, the dominant political party, would remove Yuan Shi-kai by parliamentary means or by force, but neither is possible while the President controls the army at Peking. The adherents of the Kwo Ming Tang do not desire to withdraw to Nanking for the purpose of establishing a Parliament there, because such action would result in disrupting the North from the South. Dr. Sun Yat-sen is reported to have warned the consuls at Shanghai that the completion of the loan will, however, produce that breach.

The deadlock is now complete. Members of the Kwo Ming Tang fear that some of the Powers represented in the loan—Great Britain, France, Germany, Russia and Japan—may now strengthen the hands of Yuan by recognizing the republic at an early date. An interesting question arises as to whether the United States will anticipate these Powers, in spite of the fact the Chinese House of Representatives has again failed to elect a Speaker.

It is probable that the Southern party will seek to cancel the loan as a test of their strength against Yuan.

What's the Matter with Missouri?

When Governor Major of Missouri was but newly installed recently as the executive head of that state he exprest sentiments which indicated that he was not in sympathy with the corporation-baiting policies of the administration he had succeeded. It may be remarked here that to local statesmen in the West and South all corporations look alike. In one form or another they are "combines." They all have money, more or less; the more they have the greater their unpopularity. Insurance corporations of all kinds seem to have a superabundance of it. It doesn't represent manufacturing plants, stocks of goods, or anything of that sort—it's just money, bonds, stocks, mortgages and richness generally.

And so it has happened that for years Missouri and other states over and down in that direction, have made life miserable for insurance managements and their local representatives. The Missouri legislature has harried them uncommonly. It went to the length of compelling accident companies to pay the face of their policies for deaths occurring thru the suicide of their holders. By no stretch of the most fervid imagination could it be assumed that accident companies, at the premiums they charge, could undertake to pay suicide claims. That measure is a sample of the unreasonable exactions made of all branches of corporate insurance.

Two years ago the legislature of that state enacted a law prohibiting fire insurance companies from making their own rates. The law was very comprehensive. Rate-making was put under the supervision of the state and the companies were ordered at their own expense to provide all the machinery for doing the work. No risk could be written at any rate save the one approved by the state authorities. The companies obeyed and buckled down to the work, finishing the big task several months ago at a cost to them of $200,000.

Now all that is thrown on the scrap pile. A new legislature repeals the law and in its place makes some drastic amendments to the anti-trust law; and the companies are ordered by the Attorney-General to do some real competing. That official's attitude, as evidenced by his outgivings, is so hostile as to cause the companies to cease operating in Missouri, which they will do after the 30th of April. The companies feel that under the law as it now stands, and as it is interpreted by the Attorney-General, they are in for convictions whether guilty or innocent—that they are damned if they do and damned if they don't. So they have concluded to quit a state, the loss ratio of which in 1911 was seventy-three per cent and in 1912, seventy per cent of the premium income. As a result, the business element is in an uproar; for without fire insurance protection their credit is gone.

Just what moved the present legislature to do it is past analysis, but as a matter of fact it did repeal the suicide law referred to in an earlier part of this article. The action was welcome enough to the casualty agents in the state. But the change was ephemeral—the Governor vetoed the repeal bill straightway. And now it is probable that all the casualty companies will withdraw from Missouri.

So it may be said that, insurance-wise, things are in a chaotic condition in that field, and that the people's representatives and executive officers are "ornery" to a "right smart" degree.

The Equitable Stock Control

As Mr. J. Pierpont Morgan, owner by purchase from Mr. Thomas F. Ryan, at a price closely approximating three million dollars, of the majority stock of the Equitable Life Assurance Society, made no provision in his will touching that matter, it is reasonable to conclude that either he had no matured plans for the "mutualization" of the company, or that he communicated privately to his executors his wishes as to the disposition to be made of that part of his estate.

At irregular intervals since the control of the Equitable past out of the hands of the Hyde family, there have been demands from various quarters that the stock interests be retired and that the company be recast on purely mutual lines. This clamor for "mutualization" was not repelled by either of the purchasers of the control, and

the idea has generally prevailed that, if they were not active in bringing about the change, they were willingly acquiescent it should occur at the proper time. A start toward mutuality was made when the stock was placed in the custody of trustees who were empowered to elect, on behalf of the policyholders, twenty-eight of the fifty-two directors. This arrangement continues, but it must be admitted that it is only the form and not the substance of government by the policyholders.

It has been understood that Mr. Morgan was willing at any time to sell his holdings to the company at the price he paid, plus a reasonable rate of interest on the money he invested. His acquisition of the stock did not carry with it an obligation to undertake and carry out the work of "mutualization." That responsibility, it would seem, rests mainly on the parties most nearly affected—the policyholders. They have done nothing at all in the matter, and if they have any desires or opinions on the subject they have not uttered them.

There is, as there should be, a distinct tendency on the part of the life insurance buying public toward mutual companies; and the importance of this system to the interests of policyholders is vividly illustrated by a study of the immense sums representing those interests in such companies as the Equitable, with its half billion of assets and its billion and a half of outstanding insurance. It is something of an anomaly that $50,200 par value of stock should control a community accumulation of such vast proportions.

Industrial Accident Claim-Scaling

It is verging on to two years now since a rigid examination was made into the claim-paying methods of certain accident companies which confine their operations almost exclusively to writing small policies on the monthly premium plan. The conditions disclosed by the committee of insurance commissioners which conducted the investigation were scandalous. It was found that the companies in question systematically and deliberately robbed the ignorant working classes of part of the paltry benefits due them for injuries and illness; while those who are in the insurance business and are acquainted with the facts, knew that the officers of those companies, men of not even ordinary insurance ability, were rapidly growing rich.

Industrial accident insurance, so-called, must rely for its patronage on the laboring element of the population. The protection these people buy consists of $10 or $15 a week indemnity if they are injured or fall sick, and $200 or $300 as a burial fund if they die. They don't always understand their rights under the contracts they hold, and they are easily disposed of by slick adjusters. This was abundantly proven in the investigation of 1911. For this reason the claim departments of all the industrial accident companies should be overhauled by some insurance commissioner at least once a year.

Not very long ago, within the present year, one of the companies which was condemned by the commissioners two years ago for its claim-scaling propensities and forced to reopen a number of cases and make restitution, was detected by the New York Insurance Department in another questionable practice thru which policyholders were deprived of benefits. The president of the company—a Chicago institution—was summoned to appear before the Superintendent of Insurance and explain matters. There was no explanation; just a confession of misbehavior and a promise to reform.

Either these practices should be abolished, or the companies addicted to them put out of business.

Revised Standard Fire Policy

The special committee of the National Convention of Insurance Commissioners having the matter in charge, have completed a revision of the standard fire insurance policy and will report it to their organization. The new form is shorter than the old by 400 words, the various provisions are indexed marginally, and the grouping is more systematic. A new condition providing for the services of an umpire at the request of either of the two appraisers is introduced, lodging the selection of the umpire with the commissioner of insurance.

The Home Underwriters

After years of unsuccessful opposition to the continuance of "underwriters' agencies," the Home Insurance Company of New York has announced that, as a measure of self-defense, it will establish the Home Underwriters, putting out an additional policy under that name backed by the resources of the company. President Snow reaffirms his opposition to the "agencies" and is ready at any time to aid in their abolition. The troubles which fire underwriters suffer from without are exceeded in number and intensity only by those they make for themselves.

FINANCE & TRADE

Valuation of Railroad Property

A great task is about to be undertaken by the Interstate Commerce Commission and the railroad companies of the United States. The commission has been directed, by an act approved a few weeks ago, to ascertain and report the value of all the property owned by every common carrier or used by the carriers for the convenience of the public. It must show the original cost, the cost to date, the present value, the cost of reproduction, and many other details. Railroad companies are required to assist the commission. It is expected that the work will consume five years, and that the cost of it, in the commission's expenditures, will be about $6,000,000. Railroad officers say the cost to the companies will be at least $6,000,000 in addition.

The commission has nearly completed a board of five engineers who are to take charge of the valuation. There will also be an advisory board of three experts. About 10,000 applications for employment in the inquiry have been received at Washington. The employees, however, a few in prominent positions excepted, will be procured thru the agency of the Civil Service Commission. Tentative valuations made by the commission must be submitted to the carriers directly interested, to the Department of Justice and to the governors of states in which the property is situated. If protests be made, they must be filed within thirty days, and if no protest be filed the valuation becomes final.

Executive officers representing fifty-two railroad companies held a conference in New York last week, with reference to the approaching valuation, and appointed a committee of eighteen members. The chairman is President Rea, of the Pennsylvania road.

Physical valuation of railroad property has been sought by those who held that the ascertained value should guide the commission in determining rates. Some have thought that investigation would show large overcapitalization. On the other hand, railroad officers have asserted and now assert that the inquiry will show that the railroad system of the country, as a whole, is undercapitalized; in other words, that the actual value of the property exceeds the value of the stocks and bonds. The relation between actual value and the securities issued will vary greatly, of course, but probably it will be shown that the property of several companies is worth more than the present market value of their bonds and stock.

The Income Tax

It is estimated by the House Committee on Ways and Means that the pending provisions for an income tax will yield about $70,125,000 of annual revenue, and that this will be collected from 424,000 persons. There will be, it is thought, 381,000 persons paying one per cent on incomes not exceeding $20,000. The tax on incomes between $20,000 and $50,000 will be about $11,700,000; from 8500 persons whose incomes range between $50,000 and $100,000 the collections will be $11,560,000; and an equal sum will be paid on 2500 incomes between $100,000 and $250,000. The remaining payments are estimated as follows: $6,743,000 on 550 incomes between $250,000 and $500,000; $9,191,000 on 350 which exceed $500,000 but are less than $1,000,000; $5,826,000 on 100 which exceed $1,000,000.

About half of those who will pay on incomes exceeding $1,000,000 are residents of the State of New York. That state, it is expected, will pay about $15,300,000 of the entire tax. Estimates for three other states are as follows: Pennsylvania, $8,070,000; Illinois, $7,448,000; Massachusetts, $3,650,000. If these estimates are correct, the residents of these four states will pay $34,468,000, or nearly half of the total.

Financial Notes

Large orders for steel bridge material have been placed by the railroad companies whose lines were injured by the recent floods. The Pennsylvania Company will expend $6,000,000 for new bridges, it is said, and the Baltimore & Ohio $2,000,000.

The appraised value of the estate of the late Col. John Jacob Astor is $87,216,691. In the estate are so-called securities having a par value of several millions which were found to be worthless. The value of the real estate is a little more than $63,000,000.

Recognition at Last

It has taken nearly two years for the United States to give formal recognition to the republic of China. It took but two weeks to recognize and then guarantee the independence of the seceding republic of Panama. There were reasons other than the bigness of China and the littleness of Panama.

President Wilson, we are glad to say, took occasion early in his administration to announce his intention speedily to give welcome to the new sister republic into the family of nations. In the stately ceremony at Peking our chargé d'affaires, Mr. Williams, delivered President Wilson's formal address, in which the conditions were stated which China has now fulfilled, "when the representative National Assembly has met to discharge the high duty of setting the seal of a full accomplishment upon the aspirations of the Chinese people." He then exprest the confident expectation that China would as a republic attain the highest degree of development and well being, and that the republic would, under its new rule, fulfil all the obligations previously assumed. Then President Yuan Shi-kai responded warmly, recognizing the "seventy years of uninterrupted friendly intercourse between China and the United States, promised to perfect free government, with the sole aim to maintain the union of law and liberty at home, and peace and friendship abroad, thru the full execution of all establisht obligations. It was an admirable response to an admirable welcome into the family of nations.

All this ceremony, cordial as it was, cannot begin to express the gratification of our people in the fact that the oldest and most populous of empires joins the lengthening procession of republics which our own republic leads. In 1776 thirteen weak colonies strung along the fringe of the ocean declared independence, and eleven years later invented a new form of government by the people, utterly discarding the divine right of kings. It was a doubtful experiment, but it was right, and they ran the risk. It succeeded. Now a century and a quarter has past, and what do we see? The whole hemisphere has followed our example, north of us as truly as south of us. The impulse crost the Atlantic and our ancient ally of France is a grand and mighty republic, and all the rest of Europe is either republic in form, like Switzerland and Portugal, or more or less republican in essence, from Great Britain to Russia. South Africa is, like Canada, a virtual republic, as is Australia, and North Africa is headed in the same way. And now Asia amazes us, Asia of ancient tradition, whose people never thought of self-government, the land of sultans and emperors. Turkey adopts a constitution; Persia tried to be a republic; India has started in the course; Siam feels the impulse; Japan stands equal with the best of nations, ruled not by its sacred Emperor, but by its elected representatives in the Diet; and now, most astounding of all, the last of the independent nations of Asia, mighty China, vastest and oldest of empires, will have no more personal ruler, reaches out her hand across the Pacific to grasp ours, and asks us to teach her how to be free and strong and

happy. The whole world has now in these one hundred and twenty-five years been revolutionized. We sowed the seed; the world plucks the flower.

Now, as an older sister, let our republic be sisterly to China. We have done well in withdrawing from the six-Power loan; we have individually, by the teachers we have sent, introduced the elements of our Christian civilization and have made the republic possible. Let that work go on. Let our churches send their ablest men with the purest altruistic purpose in view. Would that we could say that we will withdraw all discriminatory legislation against yellow men, and make all nations equal before our laws; but what as a nation we fail to do, our mission of education and religion will do, better representing our better sympathy.

Thus do we give All Hail to the youngest, yet to be the greatest of republics. What China may yet do for the world we cannot anticipate. She already shows us great men, of great idealism and of great accomplishment. Her Washingtons will be followed by great scholars, great poets, great inventors, great philosophers, none greater the world over. Our children will see and admire; but we have seen in our day the greatest revolution in the history of the world.

California Insistent

The mission of Secretary Bryan, backed by a message from President Wilson, has failed. California softens the language, but does not soften the substance of her discrimination against the Japanese. The final draft of her law stands, to the effect that Japanese and Chinese cannot acquire and own land, and can lease land for only three years. There is no such prohibition against citizens of other nations, only against these Asiatics.

Altho he failed, Mr. Bryan has done his work well, and it is well that he attempted what from the beginning seemed impossible. He was dignified, as became one who represents our nation among the nations of the world; he recognized the rights of the state, and simply asked that it recognize the interests of the nation. He spoke plainly, and in his very respectful and tactful, and yet positive farewell address he asked the Legislature to pass the question over to a referendum of the people. He appealed from the legislators to the people whom perhaps they misrepresented. We presume that 20,000 voters will ask and get such a referendum. Above all, our Secretary of State proved to Japan that whatever the State of California might do, the nation does not approve any act which may properly offend a sensitive and worthy sister nation.

Mr. Bryan plainly told the legislators that they had not assented to the President's request. He had asked that they make no such discrimination as that which denied ownership of land to people "ineligible to citizenship." Precisely the same discrimination is made in the bill, which says that those "eligible to citizenship" may own land, and then denies the right to all others. The bill as passed allows those of any country who are eligible to citizenship to acquire and hold land like any citizen; and it then provides no others shall own and hold, or lease for more than three years, any land whatever in the state, except as the right is given by treaty. Now, the treaty with Japan on this subject is very peculiar. It allows Japanese to own or lease land and buildings for purposes of merchandise or manufacture, but it does not provide that they may occupy land for agricultural purposes. This right must have been intentionally omitted, and the result is that it is only land for agricultural purposes that will come under the new law; and the California law is simply based on the treaty. It does not annul the rights given by treaty, and it denies all right of possession not given by the treaty. Under the Constitution a treaty is supreme; it overrides all state law. The California law recognizes this fact, and therefore puts the treaty into the law. This will bring the interpretation of the treaty into the courts when a case comes up for trial as to right of possession.

It is a great pity that the Legislature should have ungenerously discriminated against those ineligible to citizenship; but California has backing in the discrimination by Congress as to the right of citizenship, in similar laws by Con-

gress and by several states, and in the limitation in the treaty as to the right of possession of land, which does not include agricultural land. Bad as the California law is, it is not a new badness, but an old one, for which Congress is responsible.

Mr. Bryan appeals from the Legislature to the people. We hope the referendum will be made. It may be that a majority of the people of California appreciate the value of Japanese labor and commerce and will reject the law. Our chief objection to it is that it is based on insensate, unscientific race hatred. A man's a man, of whatever color, and every white, black, red or yellow man should receive equal privilege with every other man to walk in the sunlight of opportunity. But much as we talk of equal rights, we are slow to give them. Just as those who wrote our Declaration of Independence and our Constitution were not thinking of negroes, so when we talk of equal rights we do not happen to be thinking of Mongolians or women.

Will not some Congressman introduce a bill to repeal the act forbidding the naturalization of Mongolians? It might get enacted in the course of half a century. John Quincy Adams used to present bills for the abolition of slavery. They hooted at him, but the cause won at last.

The Women's Demonstration

Last Saturday, on the hottest day of the season, nearly ten thousand women marched in procession along Fifth avenue to demonstrate their desire for the ballot. The number is assured, for their anti-suffragist sisters were skeptical, and they set watchers along the route to count the marchers and make sure that the number was not exaggerated. The police was friendly and faithful, quite unlike the case in the Washington procession, and the immense crowds that filled the sidewalks could not but admire the beauty and color of the parade. The women who could organize so remarkable an exhibition could probably know enough to find their way to a voting booth.

The principal address connected with the demonstration was by Colonel Roosevelt the night before. It was a good speech for a good cause, but its principal value was that the speech was by Roosevelt. He represents the future. He leads the Progressives. When somewhat late he stept forward to lead, and when his party platform endorsed woman suffrage, that was an announcement to the country that the cause was sure to win. Eastward the course of woman's empire takes its way. *Ex occidente lux.* The light has reached Roosevelt, and he swings a torch and greets the rising sun. Back to the pale realms of shade, back to the twilight of tangled thickets, in gloom let the Antis fly, for with the day the victor host is marching on.

Does a Soul Have Wings?

It was a good, honest woman in New Jersey who last week saw, or thought she saw, a soul escape from the body of a dying friend, in the shape of a pair of wings. Now, does a soul have wings?

It has been believed of old times that it has. Egyptian paintings often represent funereal scenes in which the body of the deceased lies on a bier, while the soul, in the form of a small bird, escapes to fly away. This New Jersey woman's observation seems to support in a measure the Egyptian belief. No evidence exists in literary form that any Egyptian lady ever saw a small bird fly at the moment of death out of one's mouth, but there must have been some reason for the belief. This Egyptian evidence is supported by the Greek belief that the soul had the wings of a butterfly. Psyche had butterfly's wings, and Psyche means *soul.* What more can be asked? We do not recall any classic vase or bas relief in which the butterfly is seen escaping from the mouth of the dead with his breath, but the breath is the soul, air, wind, *anemos, anima,* soul, and the wings of the wind are familiar in all languages. The Greek soul, if it had them, must have shed its wings when it lit in Elysium or Tartarus, for we have many representations of those heroes Ulysses met in Hades, and none had wings. In the famous Harpy Monument the infant is carried off not by its own wings, but by the wings of the harpy.

But a more hopeful evidence occurs to us in the acknowledged fact that angels and devils have wings, those of angels more like those of Egyptian souls, that is, of birds; while those of evil spirits are featherless, like those of the Greek Psyche, that is, like the wings of butterflies or bats. Our only difficulty here is that the winged angels are all masculine, none feminine—they sometimes have six—which raises the doubt as to wings for the blessed dead, who are mostly souls of women. It is abundantly shown in art that Our Lady has no wings and never had any, for her assumption was accomplished by the wings of angels and a cloud. In the same way Milton—and no authority is better—gives the souls of the blessed no such wings as those of angels. He tells of a bright sea

> Of jasper, or of liquid pearl, whereon
> Who after came from Earth sailing arrived
> Wafted by angels, or flew o'er the lake
> Rapt in a chariot drawn by fiery steeds.

The evidence for wings, then, has been conflicting, and while the testimony of the New Jersey lady is not conclusive, it yet deserves to carry its own weight. We are in doubt whether the souls of good men have wings but not those of women, or whether the souls of those that go up have wings, while those that go down sink by their own weight of sin.

Counting Chickens Before They Hatch

A letter came recently to the "Rural Editor" from a school friend who in his boy days was very fond of counting unhatched chickens. He was one of that unfortunate group, educated by foolish parents and an undigested school system, to expect to become President of the United States—as likely as not. This was to be one of his first chickens. What other chickens this friend counted in those days we say not. But for a fact he has lived all his life in densely crowded cities; has held several offices (chickens); has half a dozen honorary letters to write at the end of his name (chickens); and otherwise has been a prosperous and useful citizen. His friend, the writer, has zigzagged around the world somewhat, written a few books, preached a few sermons, written a few editorials (chickens again), but he has never let go of garden life, and now belongs mainly to the pine woods.

The letter runs in this way: "My Dear Ned—Why do you hide yourself so completely in the woods? Humanity has got out of the forest at last; it ought to stay out. I do not believe in the 'Back to the Land' movement. It is truly a going-back affair. What we want now is to go ahead. There is nothing really worth the while that does not come within an arm's length of the man in the office. As Rural Editor of THE INDEPENDENT you are nothing more than a rustic. Just now you must know that things are going on, all the way from China to the Balkans; and as for me, I cannot understand your satisfaction with what people call retirement. Your soliloquies about brooks and wild glens and forest edges and gooseberries are all well enough, but this is the time for live men and men who are ready to strike for progress."

The writer is not certain whether his friend meant to proclaim himself a political Progressive, or not. He only knows that boys who are turned out from our schools on a single pattern fail to develop that pattern very far in life, and he answered: "Why, Jim! I have two hens which have just hatched, each one with thirteen chickens, and today another is bringing out thirteen more, in good style, and needs every spare minute I can give to her. Oh! you ought to see them! I had forgotten all about the Bulgarians, until your letter got here. Yes! yes! thank you! Let 'em fight. They are doing something to solve the world problems; let 'em solve. These chickens are Rhode Island Reds! In my judgment it is the best breed ever created—all around! Just think of it, will you! This creation of a new breed of fowls means a marvelous achievement! All brought around by Rhode Island farmers! Really one of the grandest things any man or set of men ever accomplished.

"Another thirteen will make three times thirteen, or thirty-nine; just about as pretty chickens as ever you saw. I sit down here by the coops, or to tell you the truth, squat down, and we have a jolly lot of talk a dozen times a

day. The hens have every confidence in me, and I deserve it. Bulgarians, to be sure! If they would all go to work raising chickens it would be worth the while. Some of the chickens *they* counted did not hatch, as I have heard; especially for Montenegro.

"You must let me tell you some stories about these chickens. The other night, or just before night, it was growing a little chilly, and when I went by the hen in the cow stall she called me, and when I got near her she crawled off the eggs and picked up a few straws, which she threw over her shoulders. It was plain enough what she wanted, and I handed her two or three bunches of pine straw. She tucked these nicely around her, every minute talking 'thankee' as plain as a Malayan will talk pidgin English. I have raised half a dozen sorts of chickens, and never before was taken so completely into the confidence of the brooders. These hens tell me everything, and we have the jolliest times out.

"Oh, yes! The Powers' proposition has been accepted by the Allies. Well, well! All right! That's a good thing. What the dickens are people fighting about these days? Why don't they go into some of the vacant woods—plenty all about the Balkans—and learn to live without so much putter? By the way, I have four more hens sitting, two of them under the house and two of them in the barn. Each has sixteen eggs; last year one came off with seventeen chickens; (she had seventeen eggs, of course). I go around half a dozen times a day and chat with the biddies, and see if everything is all right. These are not ordinary hens, you see; but each one deserves a name, and she has it. One of them is so companionable that we call her Polly, and another is Dutchess, being very fat. The new Chinese alphabet? To be sure! I agree with you that it is very interesting. An ideographic alphabet is enough to stop all progress. Twenty-four letters are more than enough. These hens of mine get on finely with C, L and K; adding the vowel U. Here is a first class fowl alphabet made up with four letters. It expresses a lot of common sense and emotional life.

"By the way, four times sixteen is sixty-four eggs; and that will make me fifty-eight chickens. Put these with those already hatched, and I shall have eighty-seven chickens, all sound and happy. How do I know this? Simply because we counted them. I say *we*, not editorially, but because all our family indulges in this habit. We always count our chickens before they hatch. We thoroly believe in the principle. You can see at a glance that if we put off counting until after they are hatched we will know no more about them than other people. Any simpleton can tell how many chickens there are *after* they are hatched.

"When you go thru your fruit garden in the spring, or when you sow the seed in your vegetable garden, don't you count the results five to six months ahead? As for chickens, just now they are worth 17 cents a pound for broilers. Now count it up. Here I have eighty-seven chickens. Three and a half pounds each makes 304 pounds. You may multiply that by 17 yourself. The clients that you will pick up ahead, and broil during the next six months, are counted on the same principle exactly. Counting chickens should be done just as soon as the eggs are put under the hens. It is just then that we need to know what we are about, and what those hens will be able to do to add to the family income.

"You see, Jim, those who sneered at counting chickens before they were hatched were brought up all wrong. But the truth of it is that you and I brought ourselves up more wisely. As boys we were always counting our chickens that were still in the future. What do I 'think of the suffragets'? Why, that you cannot count the consequences (chickens) of those blathering feminine John Bulls. They are setting back woman's rights in America shamefully. Chickens! why, six months ago, or a year possibly, we could have counted on woman's suffrage as dominant in every state by 1915. Today you cannot tell when Michigan will go straight, or New York get over its chronic agony.

"As for my fluffy Rhode Island Reds, there it is that equality rules. Colonel Bob, the only rooster in the flock, just took from my hand a big chunk of bread and passed it over immediately to one of the ladies of his flock. Oh, Lord! what is the use of holding on to suffrage as our

exclusive right, when the ladies have got all the rest, and ourselves in the bargain! Why not hand over the ballot as gracefully as Colonel Bob? 'The report of the Richmond convention, did I read it?' You can be sure that I did, nor have I forgotten Mrs. Staunton and Wendell Phillips. Theodore Parker was the only one of the Boston leaders that opposed giving suffrage to females. He wanted first that they should grant suffrage to him in the pulpits.

"I have several chickens now incubating in my study; whether they will ever find publishers or not, who knows. We never knew an author to die without leaving a lot of pigeonholes crowded full of little manuscripts, and big manuscripts, and manuscripts in every stage of evolution. This is one of the sorrows of old age, that it cannot hatch over one-half its projected plans. Dear me! but how much like a chicken coop this world is, after all."

A judicious collection of unhatched chickens has the advantage that you are rich most of the time. When the hatching comes, then there will be a moderate measure of disappointments. A few eggs will of course be addled; a few chicks of hope be trodden on, and once in a while mathematics will collapse altogether. Some of the best chickens we have are our disappointments.

An Educational Problem

More and more nearly in this country women are monopolizing the teaching profession in our public school system. This means that few men are attracted to it, and it is not easy to find men to fill the positions for which they are desired. Half a century and more ago, before the growth of our normal school system, it was easy to get men teachers even in district schools for the winter term, when college students eked out their income by teaching. Now there is a lessening number of men in the normal schools. They prefer to go to a university or to an agricultural college. At the Albany Normal College there are hardly a dozen men students, and at the New Paltz (N. Y.) Normal not one. In Teachers' College of Columbia University the men do better, about one in eight or ten students.

More and more the men are being crowded out of all but the principalships of large public schools. Women can be had for other positions at lower salaries, which are not sufficient to attract men of education and ability. So long as salaries will not allow a man to support a family men will look elsewhere than to the teaching profession. Nor is it clear, as they assert in Germany, that boys require male teachers to keep them from being effeminate. There is no evidence that our boys are being injured in that way.

The First Judicial Recall

Charles Weller, of San Francisco, enjoys the distinction of being the first judge in the United States to be recalled by the people. California is one of the few states that permit the recall of judges, and on the 22d of April this constitutional provision — adopted in 1911—was given its initial trial. At an election held on that day Weller, a police judge, was ousted from office by the close vote of 30,784 to 29,934.

It is an interesting and significant circumstance that his recall was brought about by the women of San Francisco. It had its beginning in the righteous anger on the part of three or four women when they learned that this judge had arbitrarily reduced the bail that had been fixt by another judge in the case of a man charged with assault upon a young girl, with the result that the man forfeited his bail and escaped trial. Investigation of court records followed, and it was discovered that bail in similar cases of crimes against girls had rarely been fixt beyond $500 and was sometimes placed as low as $50. Also, that it was a habit of the court to grant long series of continuances, with no testimony taken in many cases, until such a day as the girl in the case would happen not to appear as a witness, when the case would be immediately dismissed.

These revelations so aroused the investigators that an appeal was made to the women voters of the city to join together for the purpose of securing the recall of a judge who was so flagrantly abusing his powers and deliberately permitting the miscarriage of justice.

Forthwith the Recall League of San Francisco was organized, and in a short time it had secured the required number of signatures to the preliminary petition for a recall election. The movement was backed by the religious and progressive elements of the city, and was opposed for varying reasons by the Bar Association, the "big interests" and organized vice.

Weller's chief defense was that he had merely been following a custom which he had not created and for which he was not responsible. Wiley F. Crist, his opponent in the election, and who now occupies his place on the bench, in commenting upon the recall, said:

> The campaign was not aimed at Judge Weller solely, but rather at the system which has been increasing instead of decreasing the commission of crime. And the recall of Judge Weller signifies that the people no longer have the superstitious awe of our judicial oligarchy that has existed in the past.

Nevertheless, we do not favor the recall of judges in general, altho the case of police magistrates is different, and in this case it seems to have worked well; and so has woman suffrage worked well.

Beef from Abroad

A Government report, published last week, shows that in the latter part of 1912 the cost of living in the United States was higher than at any other time in the past twenty-three years. It gives the approximate cost of a year's supply of food for an average workingman's family in various parts of the country. In the North Atlantic States, for example, this cost increased from $300 in 1896 to $466 in 1912, and the upward movement in the North Central States was from $276 to $463. An average of the figures shows an advance since 1896 from $274 to $444, or 62 per cent.

Much of the increase has been due to the higher cost of meats. So far as beef is concerned, the effect of a declining domestic supply has been added to the effect of conditions which have raised prices thruout the world. In the last seven years, while our population has increased by 11 per cent, the number of beef cattle in the United States has decreased by 30 per cent. Our exports of beef have fallen to almost nothing and we are importing a great many cattle, but prices continue to rise. The tariff duty on beef is about to be removed, and beef will be imported.

To our Pacific States, it is said, beef will be brought from Australia. The Government at Washington publishes in its *Daily Trade Reports* an article from a London financial journal which sets forth the predictions of agents of the Australian Government now stationed in San Francisco and elsewhere. A steamship company has ordered four large refrigerator carriers for the trade. A firm in San Francisco has engaged all the available refrigerator space on three ships of a line between Australia and that city. It is expected that "millions of pounds" of beef and mutton will be brought to California. The "Swift and Armour interests," it is asserted, are preparing to construct a great slaughter house and freezing plant at Brisbane, from which meats will be shipped to this country. There is to be a very large killing and packing plant at a seaport of Northern Australia. "Hundreds of cattle breeders in Texas and other Southern and Western States," an Australian commissioner says, are going into the cattle business in Northern Australia, where they have taken large tracts of land. We notice that Americans are prominent and successful in the meat industry of Argentina, a country whose exports of beef are very large. One American company there earned last year $1,506,000 upon a capital of $7,237,000.

We are by no means confident that the markets of the Pacific Coast are soon to be "flooded," as the London journal says, with Australian meats, but there will be imports, and these will grow if Americans invest in the grazing lands of the island continent. Nor do we expect a sharp reduction of present prices if the packing, freezing and shipping shall be controlled by "the Swift and Armour interests." We do not clearly see why it is necessary for American cattle breeders to go to distant lands and to make there a meat supply for the American market. It is true that the free range here has practically disappeared and

that ranch lands have been narrowed down by settlement, but the business of producing beef and other meats in the United States, at prices recently and now prevailing, can scarcely be an unprofitable one. Why is it that the energy and experience of these men who intend to produce meat for the people of the United States in Australia cannot be utilized in the same industry here at home?

An Example from Kansas

Kansas has set us an example in the way of reducing the cost of justice to the poorer classes. A new tribunal is established, in which a washerwoman may collect a debt under five dollars without having the lawyer's fees cost more than the bill collected. In the new "debtors' court" no claim is to be entertained that exceeds twenty dollars. The judge of this court is appointed by county commissioners or city commissioners. In all cases the plaintiff must appear in person and tell his own story. Lawyers are barred out from making a statement or plea. The judge himself investigates the case, even going out of court, if need be, to look up testimony; or he may call in witnesses at his will. No technicalities are allowed to interfere; and the court in every way will be like those in operation in Germany and in England.

The example is a good one to be followed by all the rest of the states. The simplicity of the whole affair commends itself, and we imagine that the question will be asked until it is brought to an issue: What is the importance of the verbalities and technicalities which occupy so much of the time and attention of our common courts? Every observer understands that we have inherited a large amount of rubbish in our system of courts, and that the securing of justice, which is the only sane end, is not the chief object kept in view. To surround a court with trappings of dignity and delay was anciently of some importance. What we now want is quicker justice, with certainty and inexpensiveness. The new court should dispense with a large amount of quarreling, lawing and cheating, a good share of which we know to be dependent on the professional toils of superfluous attorneys.

A Step Backward

Of all our religious bodies we would have the Young Men's Christian Association the last one to be mixt up with theological controversy, and yet there is danger of it in two reports to be presented at the convention, which meets in Cincinnati, May 16-18.

One of these reports comes from the committee on the Evangelical Test. It would be better if it would not raise a discussion which may be divisive, but would let well enough alone. But it proposes to recognize associations which wish to remain on the present doctrinal basis as laid down over forty years ago; and it offers an alternative that associations which desire may receive in active membership those who are members of churches affiliated with the Federal Council of Churches. The advantage of this liberty is that it would do away with the anomaly of having the Y. M. C. A. define what is an evangelical Church, as it now does; and its disadvantage is that it would shut out some very good Christian bodies not allied to the Federal Council. A better way is to let the whole matter alone. Creeds are good when they express simply the present faith, and are bad when they stand in the way of progress in the faith. Local associations fairly represent the position of the churches about them, and ought to have liberty to admit members without asking too strictly whether they agree exactly with the credal statement of a generation or two ago. For example, the young men licensed to preach lately by the New York Presbytery should not be forbidden membership. The purpose of the Y. M. C. A. is union in service, and it should not be made a divisive obstacle in the way of progress.

The other report has to do with the control of teaching agencies, especially the two schools or colleges, one in Springfield, Mass., and the other in Chicago, for the training of secretaries and other officers and teachers in the local associations the world over. The report seems to have a certain suspicion of the

orthodoxy of the teaching in these schools; and it proposes that the members of faculties and the graduates must be "members in good standing of an evangelical Church." One would think that this ought to be enough and that it should stop there. But it proceeds: "of an evangelical Church, according to the standards of that Church, and are in sincere accord with the evangelical standards of the associations as exprest and interpreted by them in their international conventions." This implies presumed subscription to an old creed, however good it may be or however antiquated. Such restrictions are wrong in essence and futile in execution, and are productive chiefly of wrangling. If this step is taken it is likely to involve the association in strife which has thus far been happily escaped. The danger seems anticipated in the further provision that a permanent commission be appointed to visit the schools, apparently to see that they are all straight theologically, something like the commission which the Vatican requires every Catholic bishop to appoint to see that no modernism gets into the diocesan seminaries and no forbidden books into the libraries. The teaching in the association's training schools should be as broad as that in the evangelical churches it represents.

The additional clauses should be omitted. It is quite enough to require teachers and graduates to be members of evangelical churches. Undesirable men can be weeded out individually.

Stock Exchange Incorporation

The bill to compel incorporation of the New York Stock Exchange was defeated last week in the New York Legislature, where the Senate, by a vote of 34 to 8, approved and sustained the adverse report of its Committee on the Judiciary. This was done in the face of an emergency message, in which Governor Sulzer asked for the passage of the measure. This bill had been written under his direction and introduced at his suggestion. He ought not to have supported it, and the failure of it is in the public interest.

It has repeatedly been asserted in certain public prints that the opposition to this bill was of a sinister and unworthy character. The truth is that the measure was opposed by thousands of just and reasonable men representing commercial interests, and by others (not connected with brokerage or stock trading) who had carefully studied the history and character of exchanges. For example, it was earnestly and vigorously opposed by the Merchants' Association of New York, which has nearly 4000 members. We have published a part of the argument which accompanied the protest of the association's committee. The failure of the bill was due to the opposition of this organization and of other associations of representative citizens, rather than to any secret and unworthy influence, political, financial or otherwise.

In Brief

It may have been worth while from the literary standpoint to print the Browning love letters, and there was money in it, but it was a profanation just the same—that is, in so far as they were love letters. Yet there was about these beautiful letters a certain restraint even in the love-making which might justify the suspicion that they were written with the public in view, and this would be sustained by the fact that both the Brownings approved their publication. There is nothing sacred about epistolary lucubrations on literary themes, and such was the major part of those letters in which two accomplisht authors matched their judgments of literature ancient and modern. The letters were sold at auction last week for $32,750, a price big enough to salve any apparent mercenary impropriety.

The report comes from Tokio that the Japanese Government holds that the United States is responsible for finding a satisfactory solution of the situation in California under the treaty. True, but the bill does not seem to contravene the treaty. It specifically guards rights under the treaty. It is decencies outside the treaty that are concerned. We take it that the three-years' lease clause will relieve the situation, as the lease can be renewed under other names.

Ben Tillett, British labor leader, cables Mr. Gompers, American labor leader, and warns him, and Americans generally, not to be affected by the purpose of the British delegates in the celebration of a century of peace between the two countries. He would have us believe that their purpose is not peace, but to secure an understanding that the United States should help Great Britain

in a coming war with Germany. It is too farcical to be believed. It would be laughed at if they were to propose it. We are good friends with both empires, and they have too many sympathies in common to fight, notwithstanding all the inuendoes of the respective army and navy leagues and makers of war material.

France, too, has a literary executive—not only in the presidency, but in the post of premier. M. Louis Barthou is the author of a much-praised biography of the revolutionary orator Mirabeau. That, doubtless, is one reason why he was chosen to preside over the annual banquet by the French literary critics. And the permanent president of the Critics' Union made a good point in his after-dinner speech in describing his kind as "a sort of water-wizard going about with a hazel-switch over the desert places of the book-world, in quest of new springs of inspiration and of beauty." A very pretty figure of speech, especially in French, where the word "spring" is *source*.

Governor Johnson took Secretary Bryan on an automobile ride thru the Florin district occupied largely by Japanese raising small fruit. Mr. Bryan was shown how in that section 1500 Japanese farmers had displaced all but 400 Americans. Such displacements by a foreign population are common all over the East, and no fuss made over it. He was shown a school with twenty-two Japanese children and twenty American boys and girls; only the American scholars were six and seven years old, while several Japanese were sixteen years old. That strikes us as beautiful. They were at school learning English, instead of being at work.

The great boom in scientific and technical education appears in the fact that the academic courses in our colleges and universities are not increasing the number of their students while the scientific departments are crowded. Thus at the Institute of Technology in Boston the number of students has more than doubled in ten years, now reaching 1611. But it is a favorable sign that the number of these students who had graduated from college has greatly increased, from 160 in 1902 to 430 in 1912. More and more professional schools require that their candidates shall have already received the A. B. degree.

Ten times, or a hundred times, the money could not replace the art treasures collected by J. Pierpont Morgan just insured for $23,000,000. The value of the pictures and other objects in the Metropolitan Museum is set down as $15,000,000. All this is preserved, or will be, for the use of the public, and yet some are complaining that Mr. Morgan's will did not make larger definite bequests for charity. In England some foolish persons complain that the Government spends so much money for flowers in the Kew Gardens, as if man could live by bread alone.

The custom has been, and it has been supposed necessary, when the nation or a state or city wished to sell bonds, to make a bargain with some banking house to take them at a discount and then sell them at the full figure. The bankers make their percentage for their advertising and labor. It occurred to Mayor Blankenburg that Philadelphia might save this percentage, and he bade the treasurer to sell $7,000,000 city bonds over the counter, as he would tea or sugar. In three days he had sold nearly three millions, and all was sure to go. Let other cities take notice.

The Pennsylvania legislature cares for athletics. A state senator is "coach" for the Pittsburgh University football team. He believes cigaret smoking in the high schools unfits boys for succeeding in athletics when they enter the university, and he has succeeded in having a law enacted which punishes the sale or use of cigarets by minors. To be sure, athletics is the principal activity and purpose of a school system, but perhaps some subsidiary intellectual purpose may be gained by saving boys from an evil habit.

All thru the North the proposed bills forbidding intermarriage of white and colored people have been defeated, as in Michigan, Kansas, Iowa, Washington and Ohio. Bills for separate schools for negroes or for separate cars have been defeated in Delaware, Colorado, California and Missouri; while in New York a bill forbidding discrimination for race or color received strong Jewish support.

Having attained the highest success as a writer of poems and stories, Mr. Kipling now attempts the drama in a one-act play received with great favor by a London audience. Scarce any English author but Goldsmith has covered the three branches of literature, and of all Kipling will be supreme if he continues in his present venture.

The proposition introduced into the United States Senate by one of its members to abrogate the Clayton-Bulwer treaty by which we secured the exclusive right to build the Panama Canal is nothing less than infamous. Having received the goods it proposes to refuse to pay the price.

How California Treats the Japanese

By Kiyoshi K. Kawakami

Author of "American-Japanese Relations," Etc.

Being a land of wonders, California treats the Japanese in a manner that may well be described as wonderful. She is at once liberal and sparing. At one time she can be as magnanimous as a king, at another as uncharitable as an impatient creditor.

Nowhere else in the United States, perhaps, is provincialism allowed so completely to obstruct discernment as in California. To the Californian all Japanese must appear morally and intellectually diminutive as their stature. Because of this provincialism the Japanese in California find it more and more difficult to secure desirable dwelling places. Even the official representatives of the Japanese Government are not immune from such annoyances. To cite an instance, a Japanese consul-general at San Francisco rented a house for his residence in what the California newspapers called a "fashionable" district in that city. The official was one of the ablest and most cultured of the younger diplomats of Japan. Yet his prospective American neighbors objected to his moving into the house he rented, while the newspapers reported the "episode" apparently with no sympathy for the consul-general.

The Yokohama Specie Bank of Japan, one of the largest banking establishments in the world, and Mitsui & Co., the greatest Japanese firm engaged in international trade, maintain a branch office at San Francisco, and have been a potent factor in the development of commercial relations between Japan and the Pacific Coast. The manner in which the San Franciscans treat the representatives of these firms is not more stupid than comical. Of this the experience of the present manager of the San Francisco office of Mitsui & Co. furnishes an apt illustration. When this Japanese business man, a gentleman of cosmopolitan culture who had traveled extensively in Asia and Europe, rented a house in Berkeley, his neighbors looked suspiciously at him. If they only declined to associate with him, he would have fared splendidly, for he, being a man of thoro education and wide experience, had little in common with his somewhat benighted neighbors. But their methods of snubbing assumed a more aggressive aspect. They organized themselves into a sort of "holy alliance," and issued an injunction forbidding the fuel dealers and provision merchants of the city to accept the patronage of the heathen Oriental. At first the merchants took the mandate rather lightly, but when the resolute neighbors of the unfortunate Japanese threatened them with a boycott, they were forced to heed it. The Japanese, however, was not worried—he took the situation in good humor like a philosopher. His landlord knew him and liked him, and told him to stay, no matter what his neighbors might do. Then the belligerent folk resorted to novel tactics and enjoined their children not to associate with the little daughter of the man who rented his house to the Japanese. Still the landlord laughed and remained steadfast, tho he had to send the daughter away from home. "These people," he declared resolutely, "need education, and a great deal of it." Meanwhile the Japanese, unable to buy necessaries of life of the intimidated home merchants, sent to Oakland and San Francisco for his supplies. He furnished the house adequately, hired a white girl as servant, and lived as respectably as anybody in the vicinity. Weeks past by, and weeks grew into months, with his neighbors slowly awakening to the folly of the whole performance. They could see no reason why they should be so finical with their new neighbor from the Orient, and they began to exchange with him such social felicitations as are usually exchanged among neighbors, first from sheer curiosity, then with a sincere desire to make acquaintance with him. The campaign of education, subtle as its methods were, was at last won, for it opened the eyes of a prejudiced community.

The trouble with the people of the

Coast is that they judge all Japanese from what little they know of Japanese of the laboring class. Most of them fail to differentiate Japanese of culture and education from those of other classes, and they try to measure one with the same yardstick as the other.

Another tragi-comedy was also staged in Berkeley. A Japanese, George Shima by name, procured a residence in an exclusive section of the college town. He had made a fortune as potato grower. His ranches are islands dotting the lower reaches of the great San Joaquin River, and cover an area of more than ten thousand acres, partly leased, partly owned by himself. It is a bonanza farming, and George Shima was called the "Potato King." The man had breathed deep the atmosphere of the Golden State, and he learned how to grow with the country. Yet when he moved into his new home at Berkeley, the "society" of the college town began to talk, heaping upon him all sorts of insinuations and invectives. The newspapers of San Francisco, Berkeley and Oakland quickly lined up with the frivolous society gossipers, and conspired to pull down the man whom they had voluntarily placed upon a royal dais. "Jap Invades Fashionable Quarters," "Jap Puts on Airs," "Yellow Peril in College Town," such were a few of the thousand and one tirades and epithets which the dignified editors of the noble press of California hurled upon George Shima.

But Shima was a philosopher and a strategist. He lived in his new home in regal fashion, employing a retinue of servants and embellishing the rooms with elegant furniture; and also purchased the adjoining lot and converted it into a garden adorned with rare shrubs and flowers imported from Europe and Asia. Then his "exclusive" neighbors, who had a short while before indulged in uncharitable criticism, rubbed their eyes and began to wonder what sort of a "Jap" had come to live in their midst. And when he donated $500 to the Y. M. C. A. of the University of California, the townsmen had to recognize that even a Japanese could be as public spirited and respectable as they. That settled it. Shima was no longer a social outcast, and today the crown of the "Potato King" rests upon his head as securely as ever.

Do these stories seem complimentary to our faculty for discernment? Does it not appear that we attach too much importance to worldly possessions in determining the worth of a man? Mr. Shima is a gentleman before he is a potato king. He is possessed of the highest sense of honor; his character is impeccable. Nor is he an uncultured boor, for he is well versed in the Chinese classics, and can compose a poem or two even in the thick of business. All these qualities, however, counted for little in the eyes of the Californian, and not until Mr. Shima demonstrated his wealth in things that could be spoken of in terms of dollars and cents did they deign to meet him upon a plane of equality.

The inability of the Japanese to secure desirable dwelling places is pregnant with significance, for it must inevitably result in the virtual segregation of the Japanese from the American community. The Japanese are accused of congregating in their own quarters in our cities, but how can they avoid the course when we ourselves set up a barrier of prejudice which they are not yet able to scale or destroy? Even in college towns such as Berkeley, Palo Alto and Los Angeles, the Japanese students find it well nigh impossible to board or room with American families. What a contrast is here presented with the kindness and cordiality with which the Japanese students are received in the college towns of the East! Here any family welcomes Japanese young men as roomers or boarders, because they are more quiet, more orderly, more cleanly in habit, and less critical than their American schoolmates. In Los Angeles the Japanese Students' Club, consisting mostly of the students of the University of Southern California, desired to purchase a lot on which to build its clubhouse, but it had to drop the plan entirely, as the prejudices of the citizens made it impossible for it to secure a desirable site. Is it any wonder that the Japanese students in California, in spite of the splendid opportunities offered by her universities, are ever casting their longing eyes over the Rockies?

When in 1906 the San Francisco School Board, under the mayoralty of the now

infamous Eugene Schmitz, ordered the segregation of Japanese children in a special school, the Japanese community launched a vigorous protest, which was soon reinforced by the favorable testimonials of a body of fair-minded Americans. Whereupon the authors of the segregation ordinance proceeded to the Clement Grammar School, and bringing some of the older Japanese boys down from the higher grades, seated them beside the little American children of the primary grades, and thus had a number of photographs taken! These photographs they scattered broadcast, declaring, "Here is the conclusive argument for segregation; these big Japanese boys should not be allowed to sit side by side with our innocent little children." As a matter of fact, the big Japanese boys did never sit in the same classrooms as the little American children. There was absolutely no need for fighting the innocent Japanese children in the schools of San Francisco, but if the political allies of the trade unionists wanted to fight, they ought to have fought a little more honorably.

In the present session of the state legislature no less than thirty-four bills have been introduced, all aimed at the curbing of the rights of the Japanese—rights which, in my opinion, are obviously guaranteed by the treaty between Japan and the United States. But why should California worry about treaties? Time is not far back when she used to refer to the country east of the Rockies as "the States," as if she herself were not in the Union, but were an independent existence. She used to scorn the greenbacks of the States, its nickels and its copper goddesses of liberty, and the scorn has descended as a tradition, tho the Californian of today may be unconscious of the fact.

The thirty-four anti-Japanese bills in the Legislature of California—fourteen in the Senate, twenty in the House—are of special interest in that they indicate the nature of the favorite missile with which the California politicians assail the Japanese. Classified by their respective nature, these bills fall under these seven heads:

(1) Bills prohibiting the Japanese from acquiring title to or owning land or real property.

(2) Bills increasing the license fee of Japanese fishermen from the present rate of $10 to $100 a year.

(3) Bills providing for the segregation of Japanese school children thruout the state.

(4) Bills prohibiting the issuance of liquor licenses to Japanese.

(5) Bills forbidding the Japanese to use power engines.

(6) Bills providing for the imposition of a special poll tax upon the Japanese.

(7) Bills prohibiting the Japanese from employing white girls.

The enactment of such bills will cripple the agricultural enterprise of the Japanese, and will force most of the Japanese fishermen to quit their trade. It will spell the ruin of Japanese mercantile establishments, and it will ring the death knell of the laundry business of the Japanese, employing white girls and utilizing steam engines as they do. True, the bills, except in a few cases, do not openly attack the Japanese, for the indirect phrase, "aliens not eligible to citizenship," is preferred to the direct word "Japanese," where the real object of discrimination is the Japanese. Such indirect discriminative acts are calculated to gall the Japanese even more brutally than a direct act. As President Jordan says, "The exclusion of the Japanese from citizenship, for which discrimination no adequate cause exists, is of the nature of insult in itself. To be shut out because they have been insulted once adds doubly to a humiliation which they have no power to resent, but which they hope their nearest friend among the nations will not offer them."

Of the various anti-Japanese bills appearing year after year in the legislatures of California, those aimed at depriving the Japanese of the right of land-ownership is perhaps the most serious. The sponsors of such land bills are exhausting their resources in their efforts to create the bogie of Japanese subjection of California. They contend that if the Japanese ownership of land be not incontinently stopped, the Californian may wake up one fine morning to find all his agricultural lands in possession of

the brown man. Yet the actual facts by no means justify such alarmist notes. It is more than twenty years since Japanese began to be interested in agriculture in California. Those sections in which they have been chiefly active in agriculture are in the Sacramento and the San Joaquin valleys. The northern half of the San Joaquin Valley, unlike the coast district of California, is noted for its rigorous winters and scorching summers. Because of this inclement climate the development of the country was long deferred. The Sacramento Valley and the southern part of the San Joaquin Valley consist mostly of lowlands, always damp and often inundated. This section, therefore, was long regarded as unhealthy, and was shunned by most immigrants. It was the Japanese who opened these countries. He braved the heat and cold of the northern San Joaquin Valley, and has converted it into a thriving fruit country, famous for its raisins and wines. He worked upon the unsanitary farms on the lower reaches of the Sacramento and the San Joaquin rivers, and has made it a country rich with its onions, its potatoes, its beans, its fruits. Yet for this great contribution, what has the Japanese received as reward? Only 17,000 acres of land—8000 acres in northern San Joaquin Valley, 7000 in southern San Joaquin Valley, and 2000 in the Sacramento Valley. The two great valleys are in themselves an empire, containing some 166,000 square miles of arable lands. In such a vast territory 17,000 acres owned and cultivated by Japanese are nothing but a negligible quantity.

Back of this agitation against the landownership of the Japanese are, perhaps, complicated circumstances, whose intricacies we are not yet in position to disentangle. For one thing, American land owners are reluctant to see Japanese become independent farmers. They have found it more profitable to lease their farms to Japanese than to cultivate them themselves. The Japanese pay, willingly or reluctantly, high rents, which tempt land owners to exploit them to the utmost. The Japanese can seldom secure a long-term lease. The landlord demands the renewal of the lease every year, and the renewal of the lease means the advance of the rent.

In some cases lease contracts contain a provision forbidding the lessee to ship the crops to commission merchants other than those named in the document. In such cases there seems to exist some secret understanding between the landlord and the commission merchant for their mutual benefit. Perhaps the landlord supplements the legitimate income which he derives from the rents by sharing in the profit of the commission merchants. Yet the Japanese are satisfied, for the land is bountiful and the crops are abundant. Back in their old country they knew no farming so profitable as this. And, after all, the landlords, too, are pretty fair, when they come to think of it. So the lands leased by Japanese have increased year after year until today they aggregate 170,000 acres. It is, therefore, as a tiller of the soil—a hard, steady, frugal, provident toiler—that the Japanese has become a factor in the agriculture of California, certainly not as an owner of land. From the history of the past twenty years it seems clear that even if the Japanese are allowed to own land as hitherto, they will never become a "menace" to the agricultural interests of the state, but will, on the contrary, continue to contribute to its general prosperity, opening up new resources and extending its farm lands into regions which have not yet yielded to the plow.

The success of the Panama-Pacific Exposition depends upon the hearty coöperation of the Japanese, which fact even the most unscrupulous politicians can ill afford to ignore. Woe betide the Japanese when this consideration of self-interest no longer restrains the agitators! The only salvation for the Japanese lies in their admission into citizenship.

Momence, Ill.

The Ladies of the Cabinet

Prominent Hostesses in the New Administration at Washington

By Abby Gunn Baker

The Monday following the opening of the extra session of Congress the hostesses of President Wilson's Cabinet had their first formal day at home. It was one of Washington's ideal spring days. There was a fragrant balminess in the air that suggested crocuses and daffodils, and in the city parks the spring magnolias and lilacs were blooming. Everybody in official life was out making Cabinet calls that day, and a very large number from the resident section of Washington society also took the opportunity to meet the new Cabinet hostesses. It reminded the old timers of Cabinet receptions of fifteen and twenty years ago, when these afternoons were events of decided weight in popularizing Presidential administrations, and when Cabinet homes were always thronged on Cabinet Wednesdays.

Copyright, Edmonston, Washington
MRS. THOMAS RILEY MARSHALL
Mrs. Marshall's sense of humor survives the strain of the cartoonists' treatment of her husband.

The average American feels that the men at the head of affairs, from the President down, are there because the people have put them there and that the government is a kind of partnership in which he has a share. Therefore, when he, or she, comes to Washington, the pleasure of meeting these men, or of being received graciously in their homes, is vaguely expected. This view of the case is often laughed at and in recent administrations this has not been the view of the Cabinet families themselves. But, after all, is it not really the right view?

At all events the first Wednesday of the present Cabinet hostesses was a mild revolution. Mrs. Marshall and all the wives of the Cabinet members who were in town were at home and their callers ran into the hundreds. The Vice-President added greatly to the popularity of Mrs. Marshall's reception by receiving with her.

"My sister went to school with you when you were a small boy, Mr. Vice - President; you'll not remember her, but I was passing thru the city and called to pay my respects," said a lady who shook hands with him.

"Now I don't know about having forgotten her; what was her name?" said Mr. Marshall, interested at once, and when told he threw back his head and laughed like a boy, declaring he had not forgotten, and recalled at once an incident of their school days. It is this happy faculty of remembering faces and incidents and their human interest in people which accounts for much of the popularity of the Vice-President and his attractive wife. Mrs. Marshall is a little above medium hight, with blue-gray eyes, brown hair, clear, fair skin, and white, even teeth which show every time she laughs, and she has the most contagious laugh! One afternoon she stood in the parlor of her suite and was showing three books of newspaper clippings made

on their trip thru the West last fall. Some of the cartoons were intensely funny and some of them slapped the Vice-Presidential candidate pretty hard. Mrs. Marshall enjoyed all of them and turned the pages rapidly as she pointed out the most telling ones.

"That's pretty rough on Little Tommy, isn't it?" inquired a member of Congress who was looking over Mrs. Marshall's shoulder. Everybody out in Indiana affectionately calls the Vice-President Little Tommy.

"Oh, no," laughed Mrs. Marshall,

MRS. WILLIAM JENNINGS BRYAN
She has studied law and languages especially to be able to share Mr. Bryan's work.

showing her white teeth bewitchingly, "Why, Mr. Marshall thought that was the funniest of them all. We always see the funny side of things," she continued, "even if they do slap us."

That must be true. The wife of one of the United States Senators was speaking of Mrs. Marshall and said: "She has the most wonderful disposition. Nothing ever ruffles her, even the weather always suits her, and that is really what gives her her fine poise and graciousness, she simply never gets out of temper. And then she has such good sense. She'll never attempt what they cannot afford. They are not rich and they will live on the Vice-President's salary if she only serves tea and sandwiches—and they'll be good sandwiches, too, for she knows how to make them," she added emphatically.

Soon after the inauguration Secretary and Mrs. Bryan leased, for a four years' term, Mrs. John A. Logan's historic place up in Calumet Hill. Later, they went out to their Nebraska home to select the personal belongings they wished to have with them, tho they took the Logan house furnished. It is one of the show places of Washington. It was originally owned by Senator John Sherman of Ohio.

The Secretary of State and Mrs. Bryan are much the most widely known of any of the new Cabinet families, nor is Washington new to them as a residential city. Mrs. Bryan is a shining example of the well born, well educated, ambitious American woman. She was born in the West, the daughter of John Baird, of old Pennsylvania stock, and Lavina Dexter, of Dexterville, N. Y. She was graduated with first honors from the Presbyterian Seminary for young ladies at Jacksonville and afterward did special work at Illinois College, a co-educational institution, where she met William Jennings Bryan.

Neither of them had much money and he was almost a briefless barrister when she married him, but she had unstinted faith in his future and has always been of inestimable help to him in his career. She studied law for this purpose; when he came to Congress she matriculated in one of the Washington colleges in order to be better fitted to share his new work. She was with him in all his political campaigns and on his famous trip around the world, during which time she was presented at nearly every court in Europe. She speaks German fluently, French and Spanish with comparative ease, and has mastered them all since her marriage. Their son and two daughters are married and there are three interesting grandchildren.

The new Secretary of the Treasury, William G. McAdoo, is, like four of his colleagues, a Southerner by birth. He was born in Marietta, Ga., where he has

Copyright, Edmonston, Washington

MRS. LINDLEY M. GARRISON

Wife of the Secretary of War. Mrs. Garrison comes of an army family.

a long and distinguished ancestry. His father, Judge William G. McAdoo, M. A., LL. D., was a Confederate officer and a veteran of the Mexican war. The family property was entirely lost during the Civil War and at its close his father went to Tennessee, where young McAdoo studied law and was admitted to the bar. In 1892 he came to New York, where his marvelous success in building railroads under the Hudson River is too well known to need recounting here.

Mr. McAdoo is the widower of the Cabinet. His wife, a rarely gifted woman, died a year ago last February. He is the father of six children, and tremendously proud of all of them. His second daughter, Miss Nona Hazelhurst, was with him on the President's reviewing stand on inauguration day.

The wife of the Secretary of War, Mrs. Lindley M. Garrison, is the daughter of an army officer, Captain Samuel Hildeburne, and she was born in Arizona at an army post. After her marriage to Mr. Garrison, who comes of an old and distinguished Quaker City family, they resided for some years in Philadelphia, but since he became Vice Chancellor of the State of New Jersey they have lived in Jersey City. With a charming personality, Mrs. Garrison will be classed as one of the most handsome women of the Cabinet circle. She has traveled extensively and the fact that her father was an army officer will put her in closer touch with that branch of the service over which her husband will preside. The Secretary and Mrs. Garrison have no children.

Mr. James Clark McReynolds is a bachelor. "Entirely owing to the good judgment of my lady friends," the new Attorney General says, with a twinkle in his handsome gray eyes which somehow belies his gallant words. Like his popular predecessor in bachelordom, Mr. Hitchcock, Postmaster General of the last administration, Mr. McReynolds is tall and thin, and rather blond in coloring. He is widely known in Washington, for he was Assistant Attorney General

MRS. ALBERT BURLESON

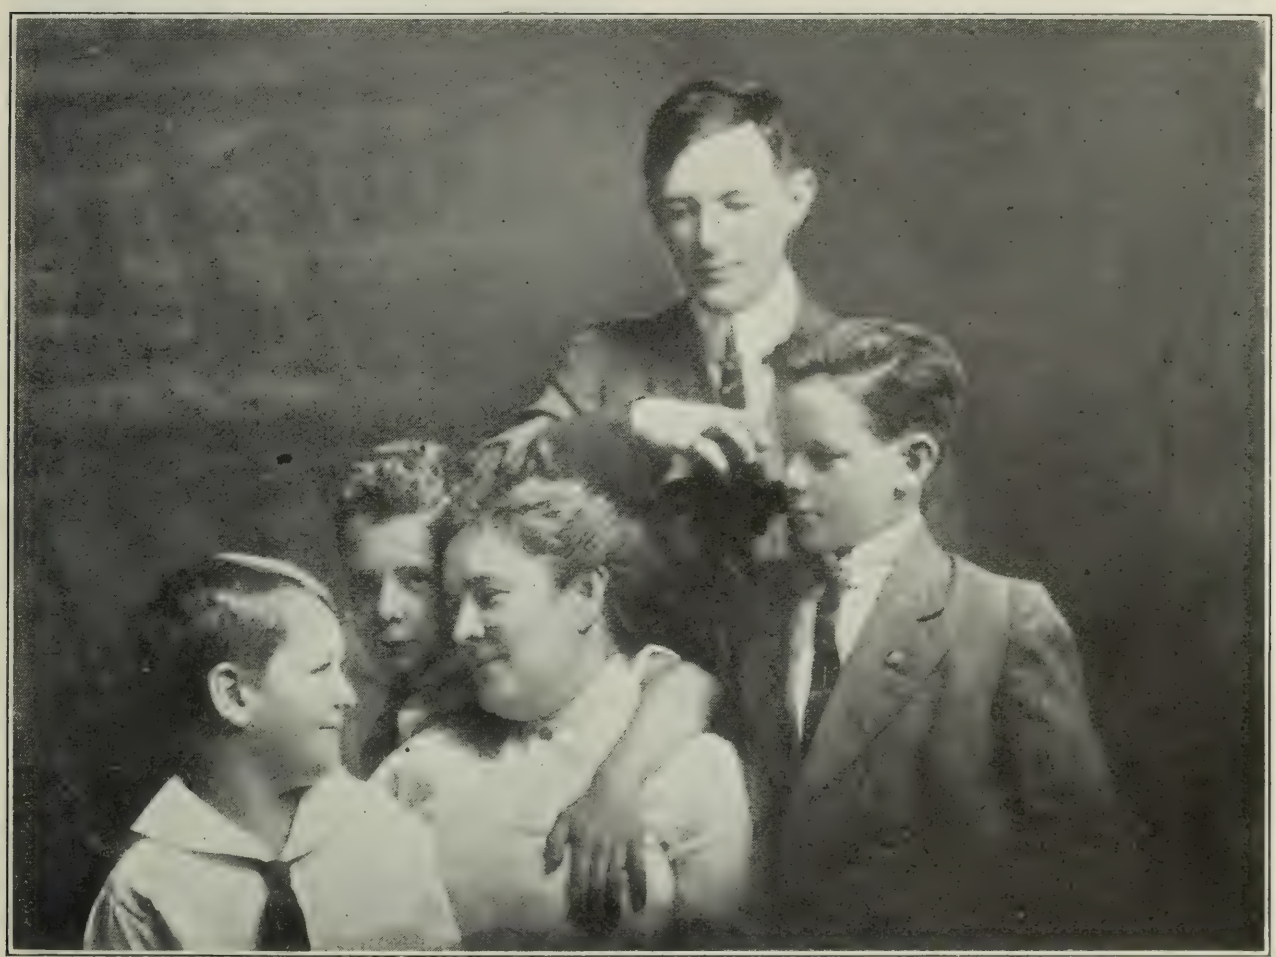
Wife of the Postmaster-General, and a successful playwright and author.

Copyright, Harris & Ewing, Washington.

MRS. FRANKLIN K. LANE

Wife of the Secretary of the Interior. Her home in Washington became a social center during Mr. Lane's service on the Interstate Commerce Commission.

under President Roosevelt and has frequently practised before the Supreme Court. He is a native of Kentucky, but has made New York City his business residence for a number of years.



A tiny little lady is the wife of the new Postmaster General, Mrs. Albert Burleson. She is of Swiss origin and her ancestors settled in Maryland nearly two hundred years ago. Mrs. Burleson is rarely gifted. She speaks several languages fluently, has written extensively and has brought out several plays which have proven decidedly successful. She is a Colonial Dame, a Daughter of the American Revolution, and is affiliated with a number of philanthropic and social clubs. She is a firm believer in the rightness of woman suffrage, tho not actively identified with the movement. Mr. and Mrs. Burleson have three daughters; the eldest was married a year or so ago to Mr. Richardson Van Wick Negley, of San Antonio; the two younger daughters are at school at Sweet Briar, Va.

MRS. DAVID F. HOUSTON

Wife of the Secretary of Agriculture. "Yards" of French lineage have left her the gift of repartee.

Mrs. Josephus Daniels by inheritance and natural affiliations is fitted for her high position as wife of the Secretary of the Navy. Her father was a major in the Confederate army, W. H. Bagley of Raleigh, N. C. Her brother, Worth Bagley, met a heroic death and was the only officer to give his life in the Spanish-American War. A younger brother, Lieut. David W. Bagley, is now in the navy. Her mother was Miss Adelaide Worth, daughter of the late Judge Jonathan Worth, for many years prominently identified with public life in North Carolina. The Secretary and Mrs. Daniels have four splendid young sons.

MRS. JOSEPHUS DANIELS AND HER FOUR SONS

The boys are Josephus, Jr., Worth Bagley, Jonathan Worth and Frank A. Daniels. The Secretary of the Navy had a hard time getting a big enough back-yard in Washington—but he did.

Where to get a home with a yard big enough for those boys to play in was a serious question with the Secretary and Mrs. Daniels. Senator Newlands came to their rescue and leased them Single Oak, a charming country place of ten acres near Cleveland Park. A few days ago the *Washington Post* said: "Josephus Daniels has had one streak of good luck after another ever since the day he was sworn in as Secretary of the Navy. The contract for Single Oak provided that Mr. Daniels should have the use of Old Mool, a black-and-white cow, and six hens and keep Tabby, a brindle cat. The lease was signed, the Danielses moved in. Since then the cow has produced a calf, the cat five kittens, and the hens a brood of sixteen chicks, besides thirty-seven eggs."

There is no doubt that those Daniels boys will enjoy the calf and kittens!

Mr. Franklin Knight Lane, the Secretary of Interior in the Wilson Cabinet, has been a member of the Interstate Commerce Commission for a number of years. Mrs. Lane is the daughter of Mr. and Mrs. Peter Wintermute, of Elmira, N. Y., but was married to Mr. Lane at Tacoma, Wash., where the family were living at that time. She is a charming hostess of cultured and refined tastes and her home at the capital is a social center

of importance. Mr. and Mrs. Lane have two children, a son of sixteen and a daughter of ten years.

Some one asked Mrs. Houston, the wife of the new Secretary of Agriculture, if she sang. Promptly she replied, "No, but I have the next thing to it, I know that I cannot sing!" Two or three women were one day discussing their ancestry before her and one of them asked her something about her lineage. "Lineage?" she replied, "Yes, I have two or three yards of it." And she probably would have if she would write it all out in a line. Her father's ancestors were French Huguenots and she is a great-granddaughter of W. P. Du Val, who was Territorial Governor of Florida under Jackson. Her maiden name was Miss Helen Beall and she was educated at the Texas State University. She is a lifelong friend of Mrs.

Copyright, Edmonston, Washington

MRS. WILLIAM C. REDFIELD

Mrs. Redfield, the wife of the Secretary of Commerce, is the daughter of a New York banker and interests herself in many philanthropies.

Burleson; they both were Austin, Texas, girls, and are very congenial in their tastes. Mr. Houston has been the Chancellor of the Washington University at St. Louis for a number of years and has always been in educational work. They are both much interested in sociological studies. They have three small children.

MISS AGNES WILSON

Eldest daughter of the Secretary of Labor. Her experience as her father's secretary has given her an unusual knowledge of the labor problem.

Mr. William C. Redfield, Secretary of the Department of Commerce, was completing his first term in the House of Representatives when he received his present appointment. Mrs. Redfield is the daughter of the late Humphrey R. Fuller, a New York banker, and Isabelle Mercein. She has lived practically all her life in Brooklyn, where she received her education at a private school of the city. They have two children, a married daughter, Mrs. Charles K. Drury, living in Montreal, and a son, Humphrey Fuller Redfield, who is a student at Amherst College. Mr. and Mrs. Redfield have traveled abroad extensively. They both belong to philanthropic organizations and are active in many charities.

Mr. William Bauchop Wilson, the new Secretary of the new Department of Labor, like his predecessor of the same name in the outgoing Cabinet, is a Scotchman; he and Mrs. Wilson were children together at their homes near Glasgow, Scotland. Mr. and Mrs. Wilson

were married in this country in June, 1883. They have an old-fashioned family of eleven children. A few years ago Mrs. Wilson suffered from a stroke of paralysis and this has kept her much of the time at their Blossburg home. Mr. Wilson served in the House of Representatives for three terms. During those years their eldest daughter, Miss Agnes Hart Wilson, was her father's secretary; she has a most unusual knowledge of labor questions. It follows that she looks on life rather seriously for so young a girl, but she has a strong and charming personality. Tho only in her early twenties she filled the responsible position of clerk to the Congressional Committee on Labor while her father was its chairman. For special public work in which she was deeply interested the American Federation of Labor several years ago presented Miss Wilson with a watch studded with diamonds.

The President's official family is not complete without including his efficient, indispensable secretary, Mr. Patrick Tumulty, who has made new friends every day since he has been in Washington. Nor could Mr. Tumulty appear in an article of this kind without his affable wife and six lovable children, who are just as full of fun as the boys of the Secretary of the Navy.

He may be an "invincible fighter" in business hours, but the youngsters have just as much fun afterwards.

The Edgell Case

May a Married Woman Be a Teacher?

[In our editorial on "Penalizing Parenthood," published March 20, 1913, we suggested that the Edgell case might come to have the historic significance of the Dred Scott slavery case and the Jane Wenham witchcraft case as one of those defeats which stand as monuments to measure the progress of the race. In New York City recently a large number of teachers, authors, editors, lawyers, ministers and sociologists met at the home of one of the leaders of the suffrage movement to organize a Committee on the Civil Service of Women. The question may be taken into the courts in order to reverse the ruling of the Board of Education in this case. After a long legal fight the Board of Education was compelled by the courts to rescind its rule prohibiting women teachers from marrying. It would naturally be supposed that the right to marry, now conceded to the women teachers of New York, includes the right to parenthood, but evidently, the Board of Education thinks differently, so another fight will probably have to be made.

The question of the married woman teacher is not peculiar to New York City, but comes up everywhere and involves the wider question of whether women of ability and ambition shall be compelled in all cases to make a choice between marriage and a profession, a choice in which either alternative means a loss to the community. From the many letters and articles which we have received on this subject we select two for publication, as they present able arguments on both sides of the question. The first is from Mr. John Martin, a member of the New York Board of Education, and one who voted with the majority against allowing Mrs. Edgell a leave of absence. The second is from Prof. W. P. Montague, of Columbia University.—EDITOR.]

In Defense of the Board

Your editorial on the refusal of the Board of Education of New York City to grant a year's leave of absence to a teacher in a high school who is about to bear a child, and on the opinion of the board that a teacher, during her child-bearing period, should resign school work, shows a misconception of vital parts of the case.

You state that the board frowns on maternity and would discourage marriage. On the contrary the board applauds maternity and encourages marriage. But, in addition, the board appreciates, as you do not, the inalienable right of an infant to a mother's care and lays down the general rule that a baby must not be sacrificed that its parents may enjoy superfluous luxury.

The Board of Education accepts the biological fact that the duties of father and of mother toward their offspring are not alike, tho each has obligations which it is detestable to shirk. Normally and desirably the father is the bread-winner; the mother the nurse and baby-trainer. To convert the woman at the child-bearing age into the bread-winner is to sacrifice the next generation to the cupidity of the present generation. It is one of the indictments against our industrial, capitalistic era that it has drawn women into factory and workshop, there to be exploited for pecuniary profit, while their babies languish for their care and the infant death rate in factory towns is monstrously high. Humane husbands willingly work to the limits of their strength to save their wives during the exhausting period of pregnancy, lactation and early infancy from the cruel burden of wage-earning. Trade unions demand a family living-wage for men. Social reformers compile family budgets as arguments for a minimum wage for fathers. The Board of Education has established salaries in high schools on the assumption that a man teacher should be able to support a family. The teacher-husband of the woman in the case under dispute is receiving $3000 a year —a salary on which the great majority of citizens can live without requiring the mother in her child-bearing period to contribute to the family purse. Employers would be only too glad to substitute the individual living-wage for the family living-wage.

Fanatical feminists, while pretending to defend woman's interests, are actually sacrificing the interests of woman and of the race to man's laziness and love of luxury. They would change the condition, still happily normal, in which the mother is exempt from outside labor, into the condition, unhappily found in various mill towns, under which the mother toils

at loom and machine almost up to the day of her supreme pangs and returns to the grind a few days later, while her baby's life, never strong, is quickly snuffed out by her enforced neglect. Some actually quote with approval and glee the alleged case of a woman member of the Finnish Parliament who took only a fortnight from her duties for childbirth. "See what a trifling incident motherhood can be made," they exclaim. "Why should motherhood exempt a woman from shouldering half of man's work?"

So horrible is the condition in factory towns that progressive states, for the protection of the next generation, compel the mother to rest for a month or two before and after childbirth. The more progressive the state the longer the compulsory rest. Neither a penurious father nor a misguided mother is allowed to plead that the family needs the mother's earnings. The law compels her to abstain from mill work. Now, the Board of Education says that, normally, the mother should be freed from outside wage-earning for nine months before the birth and at least two years after the birth and that men's wages and salaries should be fixt on that assumption. It views with horror the spectacle of a prospective mother standing for five or six hours before a class at the nerve-racking work of teaching. It thinks only with grief of the mother deserting the infant whose claims are paramount to all other claims, while she, with mind inevitably reverting every minute to that infant, is pretending to teach a troop of other people's children. And all for what? That the luxury she and her husband enjoy may be softer and more expensive. Where the husband's wages, under our chaotic social system, are not sufficient to provide the rest for the mother and her care for the babe, the remedy is to raise his wages. Where the wages, as in this instance, are ample, the remedy is to teach the parents that no luxury can atone for the loss of a mother's care to a young infant nor of parental affection and delight to a pair of adults.

If the father, being morose, cruel or stingy, refuses to recognize the mother's right, for herself and children, to most of his earnings, the remedy is not to allow his selfishness to prevail, by encouraging the mother to be also a bread-winner; but to give the mother a legal claim, which he cannot escape, to the necessary part of his income.

But, you say, some teachers do not marry and some teacher-mothers can get a cheaper woman to tend their babes as well as they. We are dealing with normal cases. Only in exceptional cases—as yet—do men not marry (tho the general adoption of your assumption that $3000 a year is not enough for parenthood would speedily increase the proportion of bachelors); only in very exceptional cases is some other woman better fitted than the mother to caress, tend and train the infant (as the appalling death record of infant asylums demonstrates). The exceptional woman who is so devoid of maternal instinct that her child can better be handed to a stranger is not the kind we want as a teacher.

The Board of Education assumes that, normally, a mother will have several children. It does not approve the race-suicide practised by the very rich, to leave time and money for vainglorious show and debilitating luxury, which is so terrifyingly depicted by Zola in *Fecundity*. Nor does it expect women teachers to emulate that debased example. Therefore it says that a married woman teacher must normally and happily expect to be out of school for maternal duties several times. If the rule were established that twelve months' leave of absence should be granted in each case, the mother, while nominally holding the position which must meanwhile be filled by a procession of transient substitutes, will really be present only for a month or two between successive periods of absence. Thereby the interests of thirty or forty children would be continually sacrificed to the avarice of the teacher.

Can you point out a single case where an employer of women labor has established the rule to grant a year's leave of absence for child-bearing? Have you or any other feminist ever disorganized your business by letting even a stenographer have a year off? Why should the children of New York be made an offering on the altar of feminist perversity?

JOHN MARTIN.

A Criticism of the Board

The recent action of the New York Board of Education in refusing the application of a high school teacher for a year's leave of absence, without pay, for the purpose of becoming a mother, has been justified on the following grounds: (1) That it is for the best interest of women teachers themselves that they be not permitted to add the burden of motherhood to the burden of teaching; (2) that it is to the interest of society at large that women be not permitted to combine professional life with family duties; (3) that it is to the interest of children that their mothers devote their whole time to their households; and (4) that it is very emphatically to the interest of the pupils in the schools and of the school system as a whole that the women who teach should be unmarried, or if they must marry, that they should at least remain childless. In opposition to these conclusions, however, the following considerations should be taken into account:

1. *The Effect upon the Teachers:* To prove that it is not to the interest of the women teachers to permit them to retain their positions when they wish to bear children, this ruling of the Board of Education has been compared by its defenders to certain beneficent statutes which prohibit manufacturers from employing their women workers directly before and after confinement. This comparison is a strange one, to say the least. Factory work is for the women who engage in it a painful necessity, while teaching, especially when continued by women after marriage, is an art or profession that is freely chosen. Moreover, the intent of the factory laws is to make it easier for women to have children when they wish them, while the intent of this action against the teachers is to make it more difficult for them to have children.

2. *The Effect upon the Race*: Whether or not women *ought* to give up their professions, it is hardly open to dispute that they *will* not, and that for the last twenty years, and for many years to come, more and more women have been seeking and will seek some sort of profession or career outside the home. Recognizing this situation to exist, quite irrespective of its desirability, the question presents itself, Shall we encourage voluntary sterility or shall we do what we can to make it possible for the increasing numbers of professional women to have children? To forbid women to have children on pain of losing their positions obviously tends to weaken the race, for it leaves the function of reproduction to be performed by the less enterprising and ambitious women, in exactly the same way that the great wars of the past left the main burden of reproduction to the less courageous and ambitious men. Professions for women may be as bad as wars for men, but that does not alter the fact that the most courageous men will go to the wars and the most capable women will seek some sort of career.

3. *The Effect upon the Teacher's Children*: A mother who is in a profession cannot, it must be admitted, give her children the same quantity of personal attention as the mother who has no interests outside her home. But in such cases quality makes up for quantity; for the kind of attention that a mother can give to her children when she has had the broadening influences, the mental and moral discipline and wisdom that come as a result of making a place for herself in the world is infinitely more worth while than the extra hours that she could have given them had she remained entirely in the home. Moreover, the trained woman can enjoy a degree of intellectual comradeship with her children *after they are grown up* which is impossible for the woman who has spent all her best years as her children's nurse. The woman who has no *organized* interest outside her household often hands over her children to nurses, and spends the leisure so gained in the *unorganized* and relatively profitless activities of "society."

4. *The Effect on the Pupils and on the School System:* It must be conceded that during the two or three years of absence necessitated by motherhood on the part of the teacher the pupils suffer just in proportion to the extent that the substitute teacher is less efficient than the regular teacher who is away on leave. But:

(a) The woman who is a mother is presumably better fitted to instruct and care for children than the spinster who lacks that normal and life-enriching experi-

ence. And this compensates also for whatever distraction of interest on the part of the teacher may arise from anxiety to return to her own children at home. As a matter of fact the sense of responsibility for her pupils and the sympathetic understanding of their needs would probably be greater even in the cases in which the teacher-mother had reason to worry about her own children at home than in the case of the average unmarried woman.

(b) Any direct loss to the teacher's pupils due either to the bearing or to the rearing of her children would be more than made up for by the indirect improvement in the status of the teaching profession that would result from freeing it from the indignity and inefficiency of *casual labor*. The Board of Education in its ruling in the Edgell case intimates to the woman who wishes to teach that when she marries she had better resign (for she cannot hope for promotion) and that when she has children she must resign. At the same time the members of the board *feel* that marriage and motherhood are normal and desirable for women. Taking their ruling and their feeling together, the logical result is an acceptance of women teachers with the understanding that they are to be only temporary or "casual" workers. Instead of encouraging celibacy and enforcing sterility for those who are to remain permanently in the profession, how much better it would be to encourage marriage and motherhood and so make it possible for girls to adopt the profession of teaching as a permanent life-work without feeling that by so doing they would have to forego their own natural functions. This whole matter can be summed up in the charge that the Board of Education wrongly and unjustly imposes upon women teachers the following dilemma—either they are to adopt teaching merely as a temporary stopgap, or else they are to forego what is admitted to be their own normal and desirable development. Either the *teaching* must be injured by being made casual labor or the *teachers* must be injured by remaining celibate and childless.

In short, the action of the board in respect to Mrs. Edgell is not justified either (1) by the interests of the teacher; (2) by the interests of posterity and society at large; (3) by the interests of the children of the teachers; or (4) by the interests of the schools and school children.

W. P. MONTAGUE.

The Deeper Joy

By Elmer Ellsworth Brown

I know the springs of happiness are deep,
  Beyond the graves wherein our treasures lie,
  Beyond the memory of things that die,
And the far dread in eyes that dream and weep;
Else would the tree of life no longer keep
  Leafage and flower and wingèd tenantry,
  But moldering stand the empty ages by,
Where none be found who either wake or sleep:

Then come disease, disaster, and despair,
  Shame and distempered thought, man's utmost wo,
So shall we know the worst that earth can give;
So shall we know—O, knowledge strange and rare!—
  From what unmeasured depth those fountains flow
Of joy, by which the sorrowing centuries live.

New York University.

The Political Strike in Belgium

By J. Salwyn Schapiro, Ph.D.

[The progress of the general strike in Belgium, which reached a successful conclusion when the Chamber of Deputies voted on April 22 for the appointment of a commission to consider electoral reform, was noted in The Week of April 17, April 24, and May 1. Dr. Schapiro is an instructor in history in the College of the City of New York.—EDITOR.]

The great general strike in Belgium was a cessation, not merely of work on the part of laborers, but of business on the part of the capitalists as well; for both are united in the common desire of compelling the Catholic government to establish equal suffrage.

Belgium has always loomed out of all proportion to its size. For many years it was the battleground of the contending nations of Europe, partly because of its strategic geographical position, but mainly because of its economic importance. Splendid coal mines and oil fields have made Belgium the Pennsylvania of Europe, and she ranks after England, Germany, America and France in the magnitude of her industries. The southern part of the country is really one gigantic group of factories. On the other hand, agriculture is the main occupation of the inhabitants in the north, who are of Low Dutch stock, speaking a tongue called Flemish, closely related to the language of the Hollanders. They are bitterly hostile to their French-speaking neighbors of the south, who are mainly of the Celtic race and known as Walloons.

For the last thirty years the government of the country has been in the hands of the Catholic or conservative party, which is supported almost entirely by the Flemish portion of the population. In spite of the fact that it represents agriculture, the policy of the Catholic party has been, in the main, conciliatory both to capital and to labor. It has safeguarded the former by far-sighted legislation in favor of commerce and industry, and has looked after the well-being of the latter by enacting a splendid system of social legislation; so that the former battlefield has become the present social laboratory of Europe. Nevertheless, the middle and working classes are strongly hostile to the Catholic government; partly because of their general hatred of clericalism, but largely because it has inaugurated and championed the obnoxious system of plural voting.

Belgium has the peculiar distinction of having an electoral system which is at the same time one of the best and one of the worst in the world. As a result of a great general strike in 1893, organized by the Socialists, the government was compelled to grant universal suffrage. Later, a comprehensive system of proportional representation was also introduced that has rectified many of the evils of "majority rule." But as a counterpoise to these democratic measures, the Catholic party enacted the present law establishing plural suffrage. Every citizen casts one vote; if, at the age of thirty-five, he is a married man with children and pays a direct tax of at least five francs a year on his dwelling, he is given a second vote; a third one is granted to those who, besides fulfilling the above conditions, also possess real property valued at 2000 francs or who receive an annual income of at least 100 francs from investments. The additional vote granted to married men constittues a sort of woman suffrage vicariously exercised. Education is also privileged; to every Belgian citizen holding a diploma from a higher institution of learning or from a professional school, two additional votes are granted. No one, however, has more than three votes.

Most of the plural voters are peasants, capitalists, officials, priests and professional men; the mass of working men, because they live in tenements and so do not pay any direct taxes on their dwellings, have only one vote. In the election of last year, 998,483, or 58 per cent of the electorate, cast one; 404,786, or 24 per cent, two, and 318,486, or 18 per cent, three ballots. In other words, a small minority of the voters are entitled to a large majority of the votes. This, in effect, establishes a political caste system which ensures the supremacy of the learned and the propertied. The rural

GOING TO TAKE THE TRAIN FOR HOLLAND

Strikers' children were sent out of the country to Socialist families to lighten the burden of the 500,000 wageless workmen in the Belgian political strike. This provision for the families of strikers is a familiar device in France and Belgium. In this country the policy has attracted much public attention owing to its use by the Industrial Workers of the World. In the textile strike at Lawrence, Mass., last summer, the police attempted to prevent the workers from sending their children away. This high-handed action aroused intense resentment and was promptly overruled by the courts. Two van-loads of children sent to New York City last week by the striking silk workers of Paterson, N. J., were enthusiastically cheered in the annual May Day parade on Fifth avenue.

PROCESSION OF MEN AND WOMEN STRIKERS IN BRUSSELS

districts, the stronghold of the Catholic party, are especially favored, as the peasants generally own their farms.

On August 15, 1911, an enormous demonstration of 200,000 people took place at Saint-Gilles Park, in Brussels, in favor of equal suffrage; a solemn oath was taken by this vast assemblage to fight against the *vote plural, vote rural, vote clérical,* which has become the campaign cry of the Liberals and Socialists.

Another great issue in Belgium is the school question. The Catholic party is committed to a revision of the present education law in favor of the schools maintained by the Church. Last year the former Prime Minister, M. Schollaert, introduced a bill known as the *bon scolaire,* that proposed to give to the Catholic schools, which already receive public support in some of the communes, an additional grant of money from the central government. The bill aroused such a storm of indignation that it was withdrawn; M. Schollaert resigned and was succeeded by the present Prime Minister, M. de Broqueville. During the recent election the Liberals and Socialists formed a fusion, known as the "cartel," which demanded not only equal suffrage for men, but completely secular education, controlled by the central government.

In spite of a vigorous campaign conducted by the "cartel," the Catholic party won by the rather small popular majority of 98,024 votes, which, their opponents declared, was entirely due to plural voting. Immediately after the election the Socialists began making preparations for a general strike against the government as the only means left to compel a reform in the constitution. In this they were aided, strangely enough, by their natural enemies, the capitalists and the employing classes generally, for the reason that the system insures control of the government to the agricultural as against the industrial interests. To some extent, the fight is one between town and country. Moreover, the middle classes are strongly opposed to what they call the "clericalization of the state" and desire an absolute divorce of religion from politics. The preparations of the Socialists for the general strike have been made with a precision almost military; provisions have been stored, money collected and the men carefully organized and drilled. Violence was to be avoided under all circumstances, in order not to give the government an excuse to put down the strike by force, as was the case in France several years ago; it was to be a strike "not of raised fists, but of folded arms."

The Socialists have also shown themselves masters of the "psychology of the crowd" by not ordering out all the men on the same day. First the miners quit work; then the metal workers; then the glass blowers; then the dockers, etc., until in a week 500,000 laborers were idle. This method was purposely adopted in order to give a momentum to the movement, and so encourage the hesitating to join and prevent the discouraged from deserting.

The attitude of the Catholic party seems to be one of stolid opposition; yet its motto has always been *Gouverner, c'est concilier,* and more than once it has yielded when faced by a determined uprising of the people; and it was forced to yield again.

The translation of the strike from the industrial to the political field became irresistible the moment it was evident that the state was really at the mercy of economic forces. Today, so closely related is the modern state to the industrial system that the government itself ceases to function the moment industrial paralysis sets in. This truth has slowly dawned on the laboring man, who now sees an opportunity of bettering his economic condition thru the ballot and his political status thru the strike. Even in agricultural Russia, where government is still a police department writ large, the small industrial element was yet able to wring a constitution from the autocracy thru the general strike of 1905.

In the half-mad brain of the humanity-intoxicated Jean Jacques Rousseau was born the mystic conception of society as a complete living organism. The drift of modern life, with its interlacing of social, political and economic forces, is giving a meaning to that abstract term "society" never before realized. Rousseau's notion has now become a vivid reality in Belgium, where great masses of human beings suddenly ceased working and "folded their arms."

"WELL!—*MY* HUSBAND WILL HAVE TO PAY AN INCOME TAX!"

THE NEW BOOKS

Nine Peace Books

That the peace movement is no longer a little "cult of cranks," but is at last entering the realm of practical statesmanship, is proved by many facts, not the least of which is the sudden efflorescence in many tongues and in all civilized nations of a great peace literature.

The United States, as one would expect, is especially rich in this literature. Not only do many of our great daily papers editorially champion the peace cause, but every month one or more magazines are sure to have a leading article on the subject, while our publishers are constantly printing volumes in support of the movement. In the office library of THE INDEPENDENT, for instance, there are over 100 peace volumes issued by American houses and all published within the past few years, while our peace pamphlets and envelopes of clippings run into the thousands.

Of the ten latest volumes that have come to our desk for review, all are meritorious, tho none are epochal. Professor Hull's *The New Peace Movement*[1] and Mrs. Mead's *Swords and Ploughshares*[2] are general arguments for peace. Altho Professor Hull has collected togetther for the most part separate addresses given before various bodies thruout the country, the book constitutes a unified and pretty complete picture of the very latest developments of the movement. We especially commend the analogies he has worked out so lucidly and fascinatingly between the history of private war and that of international war. Professor Hull's historical knowledge has stood him in good stead here, and no writer or speaker on international peace can afford to neglect the ammunition he has provided. *The New Peace Movement* is written with freshness, vigor and scholarship and we commend it unreservedly.

Mrs. Mead's *Swords and Ploughshares*, if somewhat less penetrating, is a more comprehensive and popular volume than Professor Hull's. With a remarkable wealth of illustration it outlines the whole peace problem, while the arguments for peace are presented with much skill and cogency. No woman in America has done so much for this cause as Mrs. Mead, and with the possible exception of her husband, no one knows the details of the movement so thoroly. The book is to be cordially recommended, especially as a magazine for essayists and debaters in our schools and colleges.

President Jordan is probably the most vigorous peace publicist in the United States today. His *Blood of the Nation* and *Human Harvest* are classics and have proved a veritable bulwark to the party in its war on war. His two latest volumes are equally illuminating, but they will not excite as much comment as did the two volumes above mentioned on the eugenics of war. *The Unseen Empire*[3] is an attempt to prove that "civilized nations are, one and all, in their degree under the dominion of a power stronger than kings or parliaments, more lasting than armies or navies, that is, the unseen empire of finance." President Jordan admits that he has been able to get no first hand information from the rulers of the Unseen Empire, and therefore his argument has to depend largely on inference and circumstantial evidence. As such it is plausible and frequently convincing, but manifestly until some Rothschild voluntarily confesses or some government makes an

[1] *The New Peace Movement.* By William I. Hull, Ph.D. Boston: The World Peace Foundation. $1.

[2] *Swords and Ploughshares.* By Lucia Ames Mead. With a Foreword by Baroness von Suttner. New York: G. P. Putnam's Sons. $1.50.

[3] *The Unseen Empire. A Study of the Plight of Nations that Do Not Pay Their Debts.* By David Starr Jordan. Boston: American Unitarian Association. $1.25.

official investigation, probabilities are not certainties. But every one should read Dr. Jordan's book. It is able, stimulating and breaks new ground. His collection of timely little essays, under the title of *What Shall We Say?*[4] are casual comments on current events. We especially commend his trenchant attack on the big navy craze and his exposition of the reasons why there can be no war between Japan and the United States.

Andrew D. White, as every one knows, was president of the American delegation at the First Hague Conference, and Joseph H. Choate held the same office at the Second. Both deserve undying honor for the work they did there for peace. The World Peace Foundation has reprinted in a volume of 123 pages that portion of Dr. White's *Autobiography* which deals with the First Hague Conference.[5] We have always held that Dr. White's *Autobigraphy* was one of the greatest ever produced in this country, and not the least important part of it was that which recounted his experiences at The Hague. In this book we learn of the important role the United States played at the First Conference, especially the work of Frederick W. Holls. Tho it cannot be found in the book, we may add that Dr. White and Mr. Holls were the whole American delegation to all intents and purposes, and to Mr. White perhaps more than any one else belongs the credit of inducing Germany to withdraw her opposition to the Hague Court and thus "save the day" at the Hague Conference.

Mr. Choate's small volume[6] is a reprint of his Stafford Little Lectures, delivered last year at Princeton University. They present an admirable survey of the results of the two conferences, and will be interesting to the legion of Mr. Choate's admirers, who know the great and effective part he took in the various American propositions that came before the Second Conference. While, of course, this is not a complete exposition of the conferences, like Scott's and Hull's volumes, Mr. Choate nevertheless throws several new sidelights on the conference that will be of interest to all students of these ever memorable gatherings.

In *The Peace Movement in America,*[7] Mr. Julius Moritzen, one of the editors of the *Christian Science Monitor,* has given us a thick, well illustrated volume of 419 pages. The book is built up around Baron d'Estournelles de Constant's tour of the United States in 1911, and as the Baron went from place to place Mr. Moritzen takes the occasion to digress a page or two and discourse on the American peace movement. Thus when the Baron is in the South, Mr. Moritzen writes of the peace movement in the South. When the Baron gets to the Pacific Coast Mr. Moritzen dispels the yellow peril myth; when he gets to St. Louis, of course we learn about Richard Bartholdt, and when he goes to Baltimore, Boston and Mohonk, we learn all about the Third American Peace Congress, Mr. Ginn, Mr. Mead and the World Peace Foundation, and the late Albert K. Smiley. One wonders as he reads this book how Mr. Moritzen could ever have collected all his mass of material, so complete and so up to date it is. The only criticism we make is that the volume might have been condensed, and that the author tends to praise without much discrimination all that has been done in America in the name of peace.

The Bibliography of International Law and Continental Law[8] and *Cease to War*[9] need very little comment here. The former is an excellent volume of reference, the latter is a book of mediocre miscellaneous verse, the first poem, *Cease to War,* being thirty-three pages long.

HAMILTON HOLT.

Quiller-Couch's New Anthology

Mr. Chesterton has recently defined the Victorian Age in poetry as that which left Francis Thompson without its boundaries—or words to that effect. Sir Arthur Quiller-Couch, in his new *Oxford Book of Victorian Verse* (Henry Frowde), is more generous in the temporal extension which he accords

to the term. He includes not only Thompson, but many poets much later than Thompson straight down to the present day. Even so, the main impression one gets in reading the new anthology is the unity and homogeneity of the period it represents. The principal preoccupation of most of its poets has been ideal beauty. Where they have broken thru the charmed circle of their imagining to deal directly with the social, religious and intellectual problems of their day, they have on the whole been less successful than when they have held themselves aloof from apparent reality. Of course, the notion of beauty itself has varied. Some have found it in classic art, some in exotic wildness and strangeness, others in passionate expression. Perhaps what we most nearly mean when we speak of the Victorian Age in this connection is the kind of beauty that inheres in the common things that lie close to one, in the pleasant round of daily life, in the tranquillity of the family affections.

Theoretically this ideal is the highest of all, but it requires as a preliminary condition a certain degree of beauty, or, at least, of naturalness, in the life itself from which the inspiration is derived, and this on the whole was only too conspicuously lacking in the social aspects of the age. It was the defect of Tennyson that he mistook stuffy modern domestic sentiment for a state of nature. When he tried to idealize it, he inevitably produced "Enoch Arden." Hence the revolt of Rossetti, Swinburne and Morris, which was, however, rather a reaction than a revolt, since it brought them straight back to the romantic beginnings of the century. Tennyson himself was the first pre-Raphaelite. The whole century was full of these circular movements in which we are still involved, and of which we need mention only the most recent, namely, that which has carried the modern school of Irish poets back to Mangan. But we have yet to welcome another poet like Wordsworth or Shelley, who will try to renew poetry by acting directly upon life itself thru his expression.

Sir Arthur's new anthology challenges comparison more or less directly with two other works occupying approximately the same field, or parts of it: Palgrave's *Golden Treasury* (Second Series), and Alfred H. Miles's *Poets and Poetry of the Nineteenth Century*. To the former it is inferior in that exquisite and magisterial finality of taste which makes its compiler the prince of English anthologists, while it falls below the latter in representative fullness. But it possesses an advantage that neither of the others can claim, in the completeness of its retrospective view. Of course, there are the inevitable omissions. A. E. Housman is left out and his brother, Laurence, included; there is a place for Locker-Lampson, yet no corner for Calverly—why? But the least satisfactory feature of the collection is the half-hearted attempt to represent American poets. The representation should have been more adequate, or it should not have been made at all. Most of the older men are there, and we pay a tribute to the taste of the anthologist who places Bryant's "O fairest of the rural maids," one of the few real love lyrics in our literature, along with "Thanatopsis," and who can make so fresh and original a selection from Whitman. But when we come down to a later date, and find only Bliss Carman (without Hovey), George Santayana (without Woodberry), Miss Guiney (without Miss Branch or Miss Peabody), and Ezra Pound (without Torrence or Moody), we can only feel that Sir Arthur has for once relaxed his patient and painstaking effort, and has been content to take what easily offered itself to his hand, without caring to carry on his investigations very far afield.

The Life of Ellen H. Richards

Training in domestic science has becojme so common in our schools that we forget it had a beginning and find to our surprise that the beginning is not far in the past. To Ellen H. Richards the movement for the scientific education of housekeepers owes much, and her biography by Caroline Hunt is of more than usual interest, because it treats of a vital change in the training of girls and of a vigorous and attractive personality. Ellen Swallow entered Vassar in 1868, and her diary of the years of pioneering in a woman's college is entertaining. The young women were not allowed outside the grounds save in parties of three, "so that if one is hurt, one can stay by to see that she does not elope, and one can run to get help. Accidents so often happen to girls walking quietly in the road that this is of great consequence. The senior who read her essay last night suffered everything almost. She cried over it a great deal, and when she went up on the platform she was as white as marble. Professor Farrar does not think it right to subject the girls to such a strain, and he will not go in to hear them."

When Ellen's turn came, however, she was quite composed, and in 1871 we find her entering the Massachusetts Institute of Technology as a special student in chemistry, the first woman to find an entrance there. Her friends objected:

"There's no sense in going further—it's the edge of cultivation"; but she persevered and opened the way for other women chemists, working at the Institute and supporting herself by tutoring. It is a temptation to dwell upon this useful, busy life, so rich in its interests and of such value to society as that of an expert in sanitary science. Mrs. Richards was equally efficient in her home and in her laboratory, a direct and forceful writer, a stimulating lecturer and an inspiring teacher. All of this Miss Hunt's *Life* makes vivid and believable. (*The Life of Ellen H. Richards.* By Caroline L. Hunt. Boston: Whitcomb & Barrows. $1.50.)

Panama as Seen from England

As a change from the constant stream of American books on Panama, here is one from the English side, *Panama and What It Means* (Cassell, $1.75), by John Foster Fraser, a professional globe-trotter, who writes in an easy flowing style and has an eye for the picturesque. Tho he is not free from the usual British attitude of contempt and amusement at anything American, yet he is fair in his criticism and ready with his praise. The most novel points of the book in comparison with its numerous rivals are the chapters on the diplomatic history of the canal projects, which naturally read very differently from those in American books, and on the effect of the canal on British trade and the West Indies. The book is better read a chapter at a time, for it is full of repetitions. Why does Mr. Fraser always write "Cristobel" for "Cristobal" and use "like" for "as"? The illustrations are the usual photographs, but unusually well printed.

The Crime of 1812

The wreck and destruction of Napoleon's grand army on its invasion of Russia is impressively told in Eugène Labaume's *The Crime of 1812 and its Retribution* (McBride, Nast & Co., $2.75). Labaume was an officer in the French army and passed thru all the horrors of that campaign. Possibly his political views colored his descriptions somewhat. He would seem to have been a Bourbon in sympathy; and his antipathy to Napoleon is reflected by the translator and the writer of the introduction, the latter offering extravagant praise to Russia as a factor in human progress. Yet one may join in the condemnation of Napoleon's ambition, selfishness and treachery, which prompted the war, without leaning to either the Bourbon or Russian side. Whatever the reader's own views, he cannot read this forceful recital and doubt its essential truthfulness. An army of nearly 500,000 soldiers, with thousands of camp followers, marched toward Moscow and left a path of desolation. Retreating by another route, and leaving another desolated track, it rapidly melted away. Intense cold, prolonged hunger, and the ceaseless onslaughts of pursuing Russians thinned the ranks, while the frightful sufferings of the troops transformed them into beasts that plundered and slew one another. Only a few wretched survivors succeeded in crossing over into Prussia. We do not know anywhere else so vivid and detailed a picture of the horrors of this campaign. The translation is by T. Dundas Pillans, and the introduction by the late W. T. Stead.
